SINGLE COPIES, 10 CENTS.

Huntington's Ore-Feeder.

Frank A. Huntington of this city manufactures an ore-feeder patented by himself, which is illustrated on this page. It is simple in construction, and while in motion, may be adjusted to feed fast or slow. The ore falls from the hopper on to an inclined table, where there is an adjustable gate to control the discharge. The table has its front end supported on a rocking bar and its rear end upon a similar rocking bar or link, these two being fulcrumed at the bottom so, as they are oscillated back and forth the table slides beneath the hopper and in line with the bottom. The back of the hopper has a groove into which fits the upper edge of a plate, or it is otherwise hinged thereto, and the lower edge rests in a similar groove on the surface of the table, so that as the table moves slowly back and forth, the edge of this plate is moved with it, the upper edge turning in the groove or channel which forms the hinge or fulcrum.

The ore passing out of the hopper, falls on the front end of the table. As the table moves forward, it carries this ore along, allowing none of the ore to come out from the hopper; and as it is drawn backward, the ore is prevented from moving back with it, and this causes the ore which is already on the front of the table to drop off as the table moves back. The next motion forward carries the ore toward the front and more falls in behind it from the hopper, and the discharge becomes steady and continuous with each oscillation of the table.

In order to oscillate and regulate the oscillations of the table the rear link has an oval slot made in its center and through this a shaft passes, having a cylinder fixed to it. This is made to act as an eccentric by boring or cutting from the center of one end to a point near one side on the opposite end, so that as the shaft is rotated by suitable power if the cylinder is moved so that the point where the shaft is in the center of the cylinder is within the slot, there will be no motion conveyed to the link or rocker-arm, but by moving the cylinder along the cam until that portion which is eccentric

to the shaft is within the oval slot, the greatest throw will be given to the oscillatory link and the table will be given the greatest motion. By sliding the cylinder along the shaft any degree of throw may be given to the table between this point and that of no throw, the adjustment of the cylinder being accomplished at any time without stopping the machine. By this mechanism the feed may be regulated to any degree of nicety by altering the throw of the eccen-

tric and varying the movement of the table. This feeder is especially designed to feed the Huntington roller quartz mills so well known in mining regions all over the coast.

ELECTRIC PUMPS.—The accompanying engraving shows one of the possibilities of an

APPARATUS FOR PERPENDICULAR ILLUMINATION IN MICROPHOTOGRAPHY.

electric pump. It may be placed at any convenient point on the river-bank a long distance from the power-house, and the water raised to the desired elevation. The dynamo is in the engine-house and the electric motor is arranged on the Gould pump at the pump station. This is only one of the many methods where electric pumps may be employed.

Microscopy of Iron.

The microscopy of iron is constantly widening its field. The method discovered by Sorby nearly 30 years ago, namely, the examination of carefully ground sections instead of the surfaces of fracture, has been increasingly employed. Samples of metal are ground upon metallic disks, carefully polished, cleaned and etched lightly with very dilute hydrochloric acid in order to bring out the variations of texture, which are always present, even in the finest crucible cast steel, and which are made distinguishable by the varying depth to which they are attacked.

The aid of photography has been invoked to make the results obtained by single observers the property of all. In photographing sections of this kind, only ortho-chromatic plates can be used. A further difficulty, namely, that to get a true photograph, the illumination of the section should be perpendicular to its surface, while at the same time the section must be placed perpendicular to the axis of the microscope, through which it is photographed, has been overcome by the use of a parallel-plane glass plate, which serves also as a mirror. The accompanying illustration is a convenient apparatus now used for this purpose, described in Dr. Wedding's paper on Progress of German Practice in Metallurgy, from which we have recently made several quotations.

THE HUNTINGTON ORE-FEEDER.

ELECTRIC PUMP AT A DISTANCE FROM POWER STATION.

The Miners' Association of Nevada Co.

At the recent Mining Convention in Nevada City, J. S. McBride of North San Juan was elected chairman. In accepting the position, Mr. McBride made a comprehensive, eloquent address of 10 or 15 minutes duration, first reviewing the situation. Continuing, the speaker showed that the area for the production of crops is illimitable, while the area for profitable mining is very limited the world over. This and other facts the people are awakening to the realization of. California's gold gave the nation credit when the monarchies of the Old World were eagerly awaiting the dissolution of the Republic, and this credit enabled the carrying on of the war to a successful close. If for no other reason than this, the Government should protect and foster the mining industry. It is not desired to injure the people of the valley, but to so conduct operations that all shall be benefited and none injured.

Mr. McBride refuted the argument that the hydraulic mines were of no benefit to the general public—that they are owned by foreigners and employed only Chinese, powder and water in their operations. He declared that of the hundreds of hydraulic mines of the State, but three or four are owned by foreigners, and that none of the large mines and but few of the smaller mines employed Chinese.

The speaker's peroration was a glowing picture of the prosperity to ensue from the opening of the mines—prosperity that would quickly place the mining counties on their former important level in every respect, and San Francisco again among the leading commercial cities of the world.

The report of the Committee on Resolutions, which was adopted, was as follows:

WHEREAS, The experience of the world has demonstrated that gold and silver constitute the only safe, convenient and reliable basis of credit; and

WHEREAS, The output of gold is largely below the needs of mankind; and

WHEREAS, A commission of Government engineers has reported that at the expenditure of \$1,500,000 for restraining works, \$335,000,000 may be extracted by the hydraulic process without injury to the valley rivers; and

WHEREAS, Hydraulic mining as heretofore prosecuted has contributed to the injury of the navigable streams of the central portion of California and to a small portion of agricultural lands of the valleys, and has in consequence been interdicted by the State and Federal courts; and

WHEREAS, A commission of eminent engineers appointed by the general Government of the United States has, after an exhaustive examination, reported that by the erection of proper dams, barriers and catchment basins, hydraulic mining may be resumed the debris therefrom restrained and no injury done to the navigable streams or to the agricultural lands of the State; and

WHEREAS, Under the comprehensive terms of restraining orders heretofore issued by the courts, hydraulic miners are inhibited from discharging the tailings from their mining claims into the ravines, canyons and streams tributary to the main rivers, even though so impounded as to render injury impossible; and

WHEREAS, It will be observed that the decree is not against hydraulic mining in name, but against the dumping of debris into the streams, ravines, etc., and it would therefore include all classes of mines should any action be considered necessary to prevent the debris from said mines entering the streams. All gold mining in California is hydraulic, being the same in principle, running water separating gold from the matter in which it is imbedded. It is therefore

1. *Resolved*, That to assume that hydraulic mining cannot, by due precaution, be resumed without injury to others is to impeach the genius of the age.

2. *Resolved*, That the State convention of miners, soon to assemble in San Francisco, be respectfully requested to memorialize Congress on the subject, and to use its influence for the passage of such laws as shall rehabilitate the industry of hydraulic mining upon the erection of such permanent restraining works as may be certified as safe and sufficient by competent engineers appointed for that purpose, the cost thereof to be borne as by law provided.

3. *Resolved*, That in view of the fact that the Government of the United States sold to the miner his claim and received the cash therefor for the express purpose and with the full knowledge that it was to be mined by the hydraulic process, and in view of the fact that the credit and very existence of our Government has been heretofore saved by the output of the gold mines of California, and in view of the further fact that in every financial crisis which may hereafter arise, relief must be looked for from the same source, we deem it but just that the expenses of restraining dams should be met by the general Government.

4. *Resolved*, That said State convention be requested to memorialize our Senators and Representatives in Congress to make sufficient appropriations for the construction of restraining dams for the impounding of mining debris, as recommended by the Board of Government Engineers.

5. *Resolved*, That said State Convention be also requested to memorialize our Senators and Representatives in Congress to secure such modifications of the mining laws as will prevent the Interior Department from practically nullifying the intent of the Congress enacting them.

6. *Resolved*, That we, the miners of the county of Nevada, in convention assembled, at once proceed to permanently organize for the purpose of protecting the mining industry in all its forms, to the end and intent that we may secure from the State and National Governments full protection in our just rights in pursuit of a legitimate industry, whereby and through which our county will again prosper as in the past, and that we proceed to the selection and appointment of such permanent officers and committees as may be needed, and we recommend that the officers consist of a president, ten vice-presidents, a secretary and assistant secretary, an executive committee of five, and a treasurer, and that such county organization be authorized to act in cojunction with other and like county organiza-

tions and with any State organization for like purposes hereafter formed.

7. *Resolved*, That thirty delegates be selected to attend the Miners' State Convention to meet in San Francisco, January 20, 1892, and that no person be so selected who does not pledge himself to attend.

In conclusion, we appeal to all miners of the county, and to all persons friendly to mining interests, to unite with us forwarding our just cause and in aid of the several steps necessary to disenthrall the industry by which alone prosperity can again be wooed to our homes.

NILES SEARLES,
J. G. MATHER,
A. TREGIDGO,
J. M. WALLING,
GEORGE FLETCHER,
J. B. HOBSON.

How the Funds Were Raised.

A committee was appointed to enroll the names of those present who were willing to join a permanent organization. The sum of \$1 was collected from each one signing the roll, the money thus raised to be used to meet the expenses of the organization.

The convention permanently organized by the election of Alf. Tregidgo as president and the following vice-presidents: J. S. McBride, R. McMurray, Niles Searles, H. O. Callaghan, Jerry Goodwin, Edward Coleman, N. C. Miller, P. Campbell, D. K. McKillican, Geo. Fletcher; secretary, W. F. Englebright; assistant secretary, Capt. Nibell; treasurer, Frank Snell; executive committee, Judge Walling, Geo. G. Allan, M. L. Marsh, Geo. Fletcher, Alf. Tregidgo; finance committee, Joseph Weisslein, John Rector, John T. Morgan, Cal. R. Clarke.

Delegates.

Delegates to the State Convention were elected as follows: McBride, A. B. Dibble, D. T. Hughes, J. M. Walling, A. Tregidgo, L. S. Calkins, P. Campbell, G. D. McLean, N. C. Miller, McKillican, Dobbie, Callahan, Turner, J. S. Mather, T. C. Hocking, E. Coleman, Nibell, Geo. Fletcher, Tilley, J. Goodwin, Joseph Weisslein, Elliott, C. J. Brand, H. Place, Wiltse, A. Burrows, Geo. Hare, Englebright, McMurray, C. D. Easton, Pat. Foley. The last two are alternates.

Patents at the Fair.

A new departure will be made by the Patent Office at the World's Fair in Chicago. Hitherto, it has never attempted to go beyond an exhibition of photographs and drawings. In this instance, it will offer an elaborate and comprehensive display of models. The show will be designed to illustrate as completely and as vividly as possible the age of mechanical civilization. It will give in concrete form a picture of the progress of invention.

The Commissioner of Patents says that the great exhibit of the Patent Office will be displayed. All that will be attempted in the show proper of his bureau will be to illustrate the processes through which those achievements have been perfected. For this purpose, groups of models will be prepared. For example, one group will represent the progress of the steam engine, beginning with the first one, which was built 150 B. C. by a Greek named Hero. It had a boiler and was able to do work by means of a shaft and belt attachment. From this primitive contrivance to the modern Corliss engine, in miniature, an interesting series will extend.

Other groups will be similarly arranged. One will represent the printing press, all the way from Gutenberg's original invention to the rotary Hoe machine, which turns out newspapers at the rate of many thousands per hour and folds them ready for delivery. In electricity, wonders of all sorts will be illustrated by progressive series. There will be telephones running all the way from the primitive conception to the perfected instrument now in use. The telegraph will be introduced with the actual instrument made by Morse, by which the first experimental messages were sent over the wire from Washington to Baltimore, this line of discovery culminating with the latest devices for printing messages at any distance with type and transmitting one's own handwriting across thousands of miles of space in a fraction of a second. The growth of the locomotive will be shown in like manner; also, that of the sewing machine, of the marvelous modern agricultural implements from primitive types; of clocks, from the water clock of ancient Babylon and the later hour glass, etc.

Many of the models required for these groups are already in the possession of the Patent Office, but a large number will have to be constructed especially for the purpose. Manufacturers all over the country will be asked to supply specimens of their products for representing the latest developments of inventive art. The locomotive works will be requested to lend miniature models of their newest engines. Makers of agricultural tools and sewing machines will contribute the most improved specimens of their handiwork. Likewise with printing presses and everything else. Few, if any, of the mechanical models will be set working, however.—*Washington Star*.

ALIEN LAND ACT.—Judge Collins of Chicago has rendered a decision declaring unconstitutional the alien land law passed by the Illinois Legislature of 1887. Under the Act nonresident aliens cannot acquire property, by descent or otherwise. Judge Collins said he thought the Act foolish and the Legislature mad when it passed it.

Non- Liability of Employers.

A Decision of Great Importance to Mining Men.

The Supreme Court's decision in the case of Samuel Trewatha vs. the Buchanan Gold Mining and Milling Company (appellant) filed in Sacramento, is important to mining men. The case was appealed from Tolueme county, and the question involved was as to whether or not a corporation is liable for damages for injuries to an employee through the carelessness of a fellow-employee.

Trewatha brought this action to recover damages for injuries received by him while he was employed in the mine of the Buchanan Company. The company alleged that in June, 1889, he was working in the mine, and James Donahue was the engineer who operated the engine which lowered and hoisted the tackle in the main shaft. Trewatha also claimed that Donahue was incompetent and did not have ordinary skill as an engineer, and that the company was aware of this fact, and, moreover, did not furnish the engineer the necessary appliances and means with which to safely operate the engine and hoisting works.

In June, 1880, while Donahue was engineer, Trewatha was working in the mine at the 200-foot level, and had occasion to go up to the surface in obedience to the company's directions. He got into the bucket and the engineer proceeded to hoist. The bucket was carried up with such speed and irregularity that Trewatha was thrown with great violence against and over the sheave and was injured.

The answer of the company denied all of the material averments, and alleged that any injuries sustained by Trewatha were caused by his own negligence.

The case was tried before a jury and a verdict returned in favor of the plaintiff for \$4000 damages. The company moved for a new trial, on the ground that the verdict was not justified by the evidence, and that errors in law were committed by the court. The motion was denied, and an appeal was taken from the judgment and order.

The Supreme Court quotes Section 1970 of the Civil Code and adds: "We do not think that the verdict and judgment can be sustained, even if it be admitted that the appliances complained of were as defective as it is claimed they were. The immediate and proximate cause of the injuries sustained by the plaintiff were very clearly shown to have been the negligence of his coemployee; and this, as we understand it, is in substance the averment of the complaint; nothing but carelessness can account for the fact that the engineer allowed the bucket to be hurled against the sheave—23 feet above the upper platform—whether he supposed he was hoisting a man or something else; but the rule is that where the promoting cause of the injury is the negligence of a fellow-servant, no recovery can be had, even though the machinery or appliances be defective." * * * We advise that the judgment and order be reversed and the cause remanded.

Four Hundred Millions.

What This Means When Applied to Silver.

The Treasury of the United States had in store on the 1st of October, 1891, 348,341,193 silver dollars; \$15,848,620 in the form of subsidiary silver; silver hore to the value of \$41,579,253; trade dollars (bars), \$2,394,260; total, \$409,161,326, or, in round numbers, \$400,000,000. The Government, furthermore, is increasing this immense store by buying seven additional tons of silver every working day in the year.

Now what does \$400,000,000 worth of silver mean? Stated in figures or expressed in words it conveys to minds as ordinarily constituted no definite idea other than that of an incomprehensible something endowed with certain potentialities—possibly for good, possibly for evil; yet silver is a physical entity, possessing the properties of length, breadth, thickness, capacity to occupy or fill space, and weight. Let us apply these properties to the \$400,000,000, and note some of the results of such application.

Coined into dollars, the product will weigh over 22,000,000 pounds avoirdupois, or 11,000 net tons, and if its movement is desirable will necessitate for so doing the use of 1000 railroad freight cars carrying 11 tons each, or 2200 cars carrying five tons each, or 5500 two-horse wagons carrying each two tons.

A cubic inch of pure silver weighs about 0.38 pound, and a cubic foot about 657 pounds; hence the \$400,000,000, if melted into a solid mass, would occupy some 33,500 cubic feet, which in turn would make a solid column of pure silver a foot square and about 6½ miles high, the Washington monument being 550 feet. Assuming a load of 100 pounds per man, an army of 220,000 men would be required to carry the mass, and would make a file, in close order, 80 miles long, occupying 30 hours in "passing a given point," allowing nothing for halts or rests.

The Treasury counts its silver by weighing it, which is the part of wisdom, in view of the fact that a man, counting at the rate of 200 dollar pieces per minute steadily, for eight hours a day, Sundays included, would be kept busy for considerably over 11 years.

Filed one upon the other, the \$400,000,000 would attain a height of 675 miles; and placed side by side, they would carpet a room 50 feet wide and nearly 24 miles long.

Great, however, as is the mass of silver at

present in the "treasure-houses" of the Government, it is being steadily increased by the purchase of 54,000,000 additional ounces every year, or at the rate, as before stated, of seven tons for every working-day of the year.—*David A. Wells, in Harper's Weekly*.

'Tis All Mineral Land.

An Important Decision Made by the General Land Office.

One of the most important, if not the most important, decision in the history of the Helena Land Office is the decision made by Commissioner Carter, the text of which has been received at the Helena Land Office. It bears upon the all-important question of what are mineral lands as contemplated to be exempt from the grant of the Northern Pacific. The case is already celebrated under the title of "Richard P. Barden and others, mineral claimants, against the Northern Pacific Railroad Company." Barden and associates took up five mineral claims, the Vanderbilt, Ponr Jacks, Channoe Depew, New York Central and Hudson River lodes, comprising 96 acres of very valuable land two miles from Helena. The Register and Receiver of the Helena office decided that the Vanderbilt lode was mineral, but that the others were not. The Commissioner of the General Land Office decides that all the lands are mineral in character. This same land, it will be remembered, has been in litigation for a long time. The late Judge Sawyer, during a visit to Helena shortly before his death, delivered an opinion on the case in the United States Circuit Court, in which he held that as the land was not known to be mineral at the time the railroad filed its map of definite location, it was not exempted from the grant. At the same time, he did not pass on the mineral or nonmineral character of the land. This the Commissioner of the General Land Office does. The case will have to go before the United States Supreme Court before the final settlement of the question in dispute is reached, and not until then will it be definitely known what was the full meaning of the word "mineral" in the railroad land-grant Acts.

Commissioner Carter, in his opinion, says the land in controversy was surveyed in 1868, and returned as agricultural land by the Surveyor-General. The Northern Pacific's map of definite location of the road opposite these claims was filed in the General Land Office July 6, 1882, and the tracts were selected Nov. 8, 1886, by the company; but no patent has been issued. In 1889 the mineral claimants applied for a patent, which the Helena office did not allow. On Dec. 21st of that year, Richard P. Barden made affidavit, alleging that the land was mineral in character, and therefore excepted from the operation of the company's grant.

A hearing was ordered, and the evidence given induced the register and receiver of the Helena Land Office to find that the Vanderbilt lode came within the meaning of the term "mineral lands," and that a patent should be issued, and that the other claims were not mineral. The testimony was that all the claims contained gold-bearing quartz. The commissioner says: "Upon carefully considering all of the evidence before me, I am of the opinion that it shows that mineral exists in each of these mining claims in sufficient quantity to add to its richness and justify expenditure for the extraction of ore and its exportation. In my judgment, the evidence is sufficient to warrant the finding that all the land involved in this controversy is mineral land within the meaning of that term as used in the Act granting land to the Northern Pacific Railroad." The selection by the railroad is ordered cancelled.

In conclusion, the commissioner says: "My attention has been called by the company's counsel to a case between these parties involving this same land, which was recently heard in the United States Court for Montana. The case appears to have been a suit at law brought by the company to recover possession of the premises and \$100, the value of the ore extracted by the defendants. In the complaint, the company alleged ownership of the property under its grant, and as it was not known to be mineral land at the time of the filing of the map of definite location of the road, the defendants demurred to the complaint. The presiding judge held that the demurrer should be overruled, and the district judge sitting in the case rendered a dissenting opinion, holding that the demurrer should be sustained. I am further advised that said case is now pending in the United States Supreme Court. The principal question considered by the court in the case cited was fully considered by the honorable secretary in Central Pacific vs. Vallentine, and the rule adopted in that case is herein held to control the case now being considered, in so far as it is applicable thereto."

THE BLUE LEAD.—This morning Messrs. Gardner Osgood and R. F. Floyd paid the *Mercury* a visit, and the Blue Lead was naturally discussed. Mr. Osgood has lived at Bangor for many years, and Mr. Floyd moved from there to Sonoma about six years ago, but retains an interest with Mr. Osgood in 50 acres of the lead. These gentlemen stated that in 1857 the Boyle brothers discovered the lead and in a few months took about \$40,000 from their small claim. The spring following, Mr. Floyd located a claim 180 feet in length and 80 feet wide. He took from that claim \$45,000 at

a cost of \$13,000 and it required but a few months to work out his claim.

In the meantime about forty locations were made and shafts started. Just at that time the Fraser river excitement swept the country, and the miners on the Blue Lead, as well as everywhere else, caught the fever and abandoned their claims, leaving their tools and machinery to ruin.

The old channel is easily followed, and runs toward the northwest. The pay gravel is found at depths ranging from 60 to 180 feet, according to topography. In some of the tunnels petrified wood and leaves have been found more than 100 feet below the surface. Four or five companies are at work there at present, and the prospects are growing better daily.—*Oroville Mercury.*

Yuba County Miners' Meeting.

A miners' convention was held at Smartsville, Yuba county, on Dec. 18th. The meeting was called to order by C. F. Ayer, who spoke at length upon the objects of the meeting and urged unity of action in the matter of organization, looking to the resumption of mining, and hydraulicking in particular.

A permanent organization was effected with James Nelson, President; James O'Brien Sr., O. G. Mayo, P. Campbell and C. F. Ayer, Vice-Presidents; W. J. Stewart, Secretary; S. A. Davis, Assistant Secretary; and Louis Conrath, Treasurer.

James O'Brien Sr., C. F. Ayer, L. Conrath, W. W. Chamberlain, John McQuaid, R. W. Traft, A. P. Brown, Thomas Finmore, Daniel Gettins, James Nelson, Owen Owens, Larkin Choate, Joseph Merriam, R. M. Johnson, J. C. Campbell, Chas. F. Foss, A. F. Roberts, Henry Conwell, Jas. Malaiev, Thos. Birmingham, J. H. Drake, John H. Robertson, O. P. Merrill, J. C. West, T. Cochrane, O. G. Mayo, R. Brown, John R. Kennedy, Fred Joubert and Thomas Freeman were chosen delegates to the State Convention.

An Executive and Finance Committee was elected with the following members: James Foster, O. G. Mayo, P. Campbell, A. F. Roberts, T. F. Finmore, J. C. West, L. Conrath. The roll was opened for membership of the association, and every miner present was enrolled.

The following account of the meeting we take from the Marysville *Appeal* of Dec. 20th:

A series of preambles and resolutions was adopted by acclamation, amid great enthusiasm. The resolutions bear no mark of ill-will or malice toward those associations handed together for the suppression of all mining by the hydraulic process, but appeal with candor for an adjustment of the present injunctions, and invoke the aid and protection of the National Government for this industry, which has turned so many millions into the Nation's purse in its hours of greatest need. They further speak:

We know that it needs but a fair showing of our side to convince the most skeptical that mining, to its fullest extent, can be carried on without injury to any one, and can be made a great benefit to all by an outlay of money which will be but a trifling portion of the millions which will be derived from the resumption of that industry. The injury occasioned by the closing of the mines to the owners, the losses they sustained, and the necessity for national aid to permit of the construction of restraining dams, such as reported by the engineers of the Biggs Commission.

The protection given by our Government to other industries, and asking why this great industry cannot receive Government aid, calls for one resolution. Another bears upon the relation mineral land has to others in the Interior Department, and sums up all in these resolutions:

Resolved, That the representation of this, our county of Yuba, at the Convention of Miners to be held in San Francisco on the 20th day of January next, are hereby requested to use all honorable means of having our needs placed properly and fairly before the people of our State, and before the people of the United States, through their representatives in Congress and in the Senate; that sufficient assistance may be given to an industry, the benefits of which are so general.

Resolved, That our representatives be authorized and required to assure the people of the valleys and of the State that we believe that in helping the miners, they will as certainly help themselves, and that it is the wish and intention of the miners only to resume mining in such a way as to injure no one. That the construction of the restraining works asked for will not only prevent injury for past mining done, but will prevent all injury in the future, and that the people of the valleys and of the State be asked to act in harmony with us in this matter, and to join with us in asking for the necessary relief.

Resolved, That the best endeavors of our representatives be used to secure such changes in our laws relating to mineral lands that there can be no misconception of their meaning and intent; so that our rights need not be jeopardized by the ever-varying rulings of the Interior Department at Washington.

The Secretary was instructed to request the county papers to publish the resolutions and to have copies sent to the other papers in the State.

The meeting hall was draped with flags and every seat was taken, even though the day was stormy.

After the appointment of various committees, the meeting adjourned to the call of the President.

BRAZIL has 200,000 square miles more of territory than the United States.

Quicksilver in Napa Co.

Quicksilver interests of Northern Napa county are represented largely by the Napa Consolidated and Aetna Quicksilver, both old and well-known mines, their production being approximately the same. The St. Helena *Star* gives the following bit of history of quicksilver in the county:

The discovery of the Napa was made by a man named Rogers, whose sobriquet was "Squalt Eye." He it was who sunk the first shaft, 30 feet in depth, on what is now known as Oat Hill, and following him, many others made locations, the principal ones being Cook, Porter, Vivian and Welsh, all well-known men in this section. They owned the mines which were afterward sold, and known as the Napa Consolidated Quicksilver Mining Company, the mine from which this company later on took the largest amount of quicksilver, being "thrown in" for the consideration of \$1.

At this time, the country now so well settled up was comparatively unknown, and in its native state of wild luxuriance of forests, overgrown with verdure. The mine, and the company's property in general, are situated in the northern part of Napa county, close to the line between Napa and Lake counties, in a section of the country admirably adapted to mining; the abundance of timber, the plentiful flow of clear, cold water, and the hillsides, so well situated for dumping purposes at mines and furnace, make it a favored spot. Taken into conjunction with these natural advantages, is the fact that quicksilver abounds there, and that for years the Napa Consolidated has paid dividends regularly to its owners.

In its infancy, the mine was purchased by a syndicate of San Francisco gentlemen. The management was at different times placed in the hands of Superintendents Sen, Coe and J. B. McGee, but was finally turned over to M. G. Rhodes, well known in Napa county, who for seven years operated it successfully.

During this time, the property was purchased by an Eastern syndicate, and the stock placed on the Eastern market. Part of the same companies, together with other new investors, soon after purchased the group of mines in Upper Pope valley, known as the Pope Valley Quicksilver Mining Co., and the two properties were operated under one management for about two years.

At the close of this time, Mr. Rhodes being an owner in the Aetna Quicksilver mines, gave up his position at Oat Hill, and removed to that property, which he has since managed, and was succeeded as superintendent of the Napa Consolidated mines by W. P. Lawlor, who remained in charge for a short period. Following him were several superintendents, among them being M. T. Brown of San Jose, and finally the company secured B. M. Newcomb of Colorado, an efficient mining man, who has for the past five years managed the mine in a manner satisfactory to all concerned, and is now putting out quicksilver regularly, and also paying dividends.

The Aetna Quicksilver Mining Co.'s property consists of a group of mines, mentioned above as having formerly been known as the Pope Valley Mining Co., among them being the Star, Washington, Phoenix, and Silver Bow, and was purchased by and incorporated as the Aetna Quicksilver Mining Co., from D. Patten, John Lawley, et al.

The Star was originally located by Mrs. Patten as agricultural land, but happy chance sent a wandering cow that way one day, so it is said, and she has the honor of discovering the Star, for in her nibbling among the grass roots she uncovered the ledge which afterward became the mine.

The discovery of the Phoenix belongs to John Newman. Like all old mines, it has passed through many hands, seeing its best days between 1870 and 1875 under the management of Mr. Fellows, who paid off its debts and put it on a paying basis. At this time the mine consisted of two reading rooms, where books and papers abounded, and employees enjoyed them as they only can, who are shut "from the rude world apart."

Originally the mines were worked separately, each being owned by different parties. Two furnaces were in operation, one known as the Valley Furnace, and the other as the Washington, and the ores from the several mines were sent to the furnaces to be burned, being carried in bags on the pack mules used for that purpose, and driven by Mexicans. Afterward a furnace was built on the Phoenix, and when the Aetna Quicksilver Mining Company took hold, it was torn down and removed, and is now known as the Star Furnace, being placed so as to be convenient to the Star mine, which formerly worked in conjunction with the Washington mine and furnace.

A period of time passed, the property meantime paying dividends, and then work was begun on the Phoenix, a shaft 300 feet deep being sunk, and levels and crosscuts being run. This work not proving satisfactory, the Silver Bow was then opened, which showed an encouraging prospect. Two tunnels were run on the ground, one 300 feet, the other 400 feet from the surface, and finally the old original Phoenix tunnel was extended under the Silver Bow tunnels, and a shaft is now being sunk in the latter mine to connect with the Phoenix tunnel, through which, when the work is complete, the ore will be hauled in the future, instead of being hauled in wagons as formerly.

The middle, or No. 2, tunnel machinery is operated entirely by compressed air; that is,

engines, pumps, drills, etc., while the No. 3, or Phoenix tunnel, also uses a compressor, to force air to men nearly three-quarters of a mile under ground, and will, later on, operate a drill also, by the same means.

The work is being pushed as rapidly as possible, and by spring, the company hopes to have the mine in full operation, which will be soon followed by dividends if success only greets the hardy miner at the close of that time.

Prospectors' Pointers.

Old-Timer Instructs the Tenderfoot Prospector on Locating.

"Here, young man! Bring me the end of that tomato box there and I will show you how to write a location notice," said the Old-Timer to the Tenderfoot Prospector as the former stood on the dump of the Catharine looking at the printed blank notice filled out with red ink, tacked up against a tree: "Take that one down and roll it away as a souvenir, and if you have others like it stuck up on any locations you have regard for, go and tear them down and put up new ones or they will fall down by themselves. This notice business is among the first things that you want to learn, for it sometimes is of very vital importance to your claim. When you use a paper notice filled out or written wholly with ink, it will blur out with the first rain-storm and the first wind will tear it down. Take a soft pine board and a hard lead pencil and the writing will sometimes outlast your claim. I have seen such notices that have withstood the storms of seven or eight years and still remain legible. There is a great variety of ways to write a notice, and nearly every prospector has his own way. But the briefest and most concise way is as good as any and the easiest. Now, I'll write you one for the Catharine this way:

CATHARINE LODGE.

NOTICE IS HEREBY GIVEN THAT I, the undersigned citizen of the United States, having complied with Chapter 36 Title 32 Revised Statutes of the United States and the local regulations of Barker district, claim, by right of discovery, 1500 feet in length and 600 feet in width along the mineral-bearing vein to be known as the Catharine (or any other name).

Beginning at center of discovery shaft and running: "How far do you run northerly?" "Seven hundred feet northeast."

"Seven hundred feet in a northerly direction and 800 feet in a southerly direction."

"Always say northerly, southerly, easterly and westerly in writing notices. Don't give it any specific direction. When you say 'northerly,' it gives you a chance to swing your stakes all around the North Pole, if necessary. You can swing your stakes after your location is made any way you want to, provided there are no conflicting claims unless you change from northerly and southerly to easterly and westerly, or vice versa. In that case, you have to make an amended location and record it. Let's see. Where were we? Oh yes; together with 300 feet on either side of the vein."

"Located this 18th day of June, 1791."

Locust—TENDERFOOT PROSPECTOR.

"Now that is all necessary to hold any claim, as far as the notice goes. Some prospectors put in a claim for all dips, spurs, angles and variations throughout the width, breadth and depth of the claim, but that's all foolishness. The law grants you all the spurs, and angles and dips you want. You just go ahead and do as the law requires you to do to hold any mining claim. There is no danger but that you will hold all the mineral-bearing rock inside your stakes whether you ever found them or not. As long as they are inside your stakes they are yours, and you don't need to say in your notice that you want them. When you stake your claim off, remember that only about two claims in one hundred are full size. Prospectors nearly always step them off and count three feet to a step, when 2½ is nearly the correct length. The soldier's step, which is a good stride, is 28 inches. The best, but not the most convenient way, is to take a tape line. Figure your steps at two and a half feet, and don't be afraid of getting too much ground, for when you have your claim surveyed for patent, the surveyor will draw your stakes in if they are too wide, but he will not push them out if they are too narrow. The survey must be made inside your stakes. A compass is a very good instrument to have also, so as to get your claim as nearly square as possible.

Every prospector thinks that his claims are laid out square, but I dare say that there is not a claim in Montana where the lines all turn at right angles. When you are locating several claims together, it is proper to use one post for the corner of two or more claims, instead of cutting a post for each claim corner. Or if you want to join claims with some one else's claim, you have a right to use his post for a corner also. I have seen old prospectors locate two claims together, and cut a post for each and stand them side by side, when one post, with the name of the corner of each claim written on it, would serve as well. Besides, where your claims join—it don't make any difference if they join by only a foot of ground, but they must join—it makes them continuous claims, and you can do all your work on one claim to represent them all. If you wish to patent them, \$500 worth of work is sufficient to patent them all as though they were one claim. How much does it cost to patent a claim, did you say? Oh, about \$250, besides the \$500 worth of work to

be done, and that must be done before you can make application for a patent. You make application to the Surveyor-General, and if sufficient work has been done, you pay him \$30 and he grants it. If you have several claims in a group, you apply for each separately as a continuous claim, and pay \$30 for each. Then the surveyor charges you about \$75 to do the work. He must be a deputy U. S. mineral surveyor. You pay about \$20 for advertising, and the land office fee will be about \$125. That's about all I know of.

"Well, we will look over the claim."—*Butte Bystander.*

THE BLUE JACKET MINE.—Judge Hunt, last week, refused to grant a new trial in the suit of S. Mattingly against the estate of Thomas Blythe. In October, 1882, Mattingly made an agreement with the late Mr. Blythe to find a purchaser for the stock of the Blue Jacket Mining Co. Blythe's price was \$300,000, and he told Mattingly he could have all he got over that amount. Mattingly succeeded in getting an offer for the mine of \$425,000, which he communicated to Blythe, who repudiated the contract he had made. Thereupon Mattingly commenced suit for \$125,000. The jury in Judge Flinn's court, where the case was tried, gave judgment for the plaintiff for \$75,000, but the Supreme Court reversed it on an error. The case was tried over again in Judge Hunt's court, before a jury, and resulted in the plaintiff being awarded the full amount he claimed, \$125,000. The defense asked for a new trial, but having been refused, they will take another appeal to the Supreme Court.

OIL IN NEW MEXICO.—A dispatch from Albuquerque, N. M., dated Dec. 23rd, says: It has been known for many years that a coal oil belt, crossing New Mexico from east to west, extended under nearly the whole of the county, but no company with capital enough to push the business has ever made an attempt to develop the field. Major J. W. Donnelly of the Atlantic and Pacific Land Department has just closed a deal with the representatives of a strong Eastern syndicate for a tract of railroad land in the oil region, the price being \$50,000. The purchasers intend to commence development at once with all possible vigor. This has created an active interest in oil matters here, and parties of prospectors are fitting out to search for oil on Government land. Competent geologists have declared that the indications of oil in many portions of this county are unmistakable, and that it only requires work and capital to make this a strong producing district.

PROSPECTING IN THE MOJAVE DESERT.—Col. T. W. Brooks of Pomona recently returned from a prospecting trip on the Mojave Desert and up in the region around Death Valley. He traveled over 800 miles alone. He says the mineral resources of the country are alone enough to warrant the building of the proposed railroad from Salt Lake to Los Angeles. He gives details of veins and deposits of silver opened up by Salt Lake and other miners which alone would almost furnish enough traffic for a road, but at present the ores can not be profitably handled. Being alone, with the care of a team in a country inhabited only by a few wild beasts, lizards and stray birds, he did not do much practical prospecting, but he saw enough to convince him that that apparently worthless and very forbidding country is of immense value, and that the wild beasts, birds and reptiles will not have exclusive possession much longer.

THE TYPEWRITER has hitherto been supposed to be an English invention, subsequently developed by the Americans; but a patent has been discovered in the French archives which gives the credit of originating the idea to a Frenchman, M. Pognin, of Marseilles, who devised and illustrated his apparatus as far back as 1833. "With a little practice," says the author, "one can write as rapidly with the typographic pen as with the ordinary pen. I have called it the typographic machine or pen, because it prints by striking. It will give birth to a new art." Latest developments of the invention are a typewriter for the blind.—*Machine.*

STILL THE KING-PIN.—Excitements may come and go, but one fact remains indisputable; that is that the Silver King on Toad mountain is the king-pin mine of the Kootenay Lake country. Three shifts are again at work in the main tunnel, which is in about 700 feet. Every crosscut run encounters ore, the one known as No. 6 cutting a body 47 feet wide.—*British Columbia Miner.*

CALIFORNIA TIN.—A dispatch from San Diego, dated December 21st, says: The first full carload of American tin ever produced from an American tin mine was received by W. W. Stewart from the Temescal mines. The shipment consisted of 420 pigs, or 36,800 pounds. The output of the Temescal mines is being increased, and American tin will be regularly put on the market in carload lots.

THE Lemhi Gold Placer Company of Idaho has begun the construction of a 20-mile ditch to convey water to the mines at Lemhi. The ditch is to be ten feet wide at the bottom, will require 6,000,000 feet of lumber in its construction, and will cost about \$200,000. It is expected that about six miles of the ditch will be completed by June 1st next.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

AT OLETA.—Cor. Amador Ledger, Dec. 25: Messrs. Campbell and Davis were here during the week, looking after their mining interests. I hear the mill machinery will arrive during the week. The incline is being pushed until bedrock is reached. The gravel measures about eight feet, and prospects are very encouraging. Several adjoining claims have been bought and work commenced upon them, making in all about 60 acres.

ELECTRIC PLANT AT THE ZEILE.—Ledger, Dec. 25: The electric light plant at the Zeile mine is the most complete lighting plant in the county. It is of 55 light capacity. Only 32 lights, however, have been fixed, as to run the plant to its full power would require more water than the mill batteries take, and to buy water specially for lighting would cost considerable more than under the old system. Some trouble has been experienced on account of the burning out of the wire film in the lamps, which at once renders them useless. This was caused by shutting off some of the lights and failing to shut off the electric current in proportion. As a consequence the intenser current had the effect of speedily destroying the lamps. About 13 were burned out in the course of a few nights. Of course, it takes some time to get into the way of running any new machinery properly. There is no doubt, when those in charge become acquainted with its working, it will do all that has been claimed for it. It may prove somewhat more expensive than was at first anticipated, but there is no reason to believe at present that it will be more costly than coal oil or gas.

Calaveras.

THE CURTIS MINE.—Mt. Echo, Dec. 24: Work is now progressing in the Eclipse mine, situated near Smith's Flat, and for the past few years owned and worked by Jos. Curtis, one of the present proprietors. Mr. Curtis bought the mine from M. G. Foster, who worked it successfully for a long time. This mine is located in a rich mining section, and is beyond doubt, a valuable property. The main shaft is something over 40 feet deep and the vein at the bottom is over six feet wide, all good milling ore. The mine is also tapped by two tunnels running in opposite directions, one 200 and the other 300 feet in the hill, both of which are in good ore. Some 200 feet southwest of the main lead is a shaft over 50 feet deep, in which is developed a vein of rich ore nearly seven feet in width. It is not what is known as a pocket vein, but a genuine milling lead of great value. Thos. Lane Jr., and Geo. Stickle have the contract for building the mill and timbering the shaft. At present, every preparation is being made for operations to begin at the earliest possible moment. The mill will probably be running in three or four weeks. Mr. J. F. Curtis is the Supt., and as he is thoroughly versed in mining, some fine developments may be expected.

El Dorado.

JONES HILL.—Cor. Georgetown Gazette, Dec. 25: The Jones Hill gravel mine is now running in full force under Manager Stanton. The Golden State quartz claim is once more booming, good prospects having been discovered.

Los Angeles.

ACTON.—The Register, Dec. 25: Messrs. Griffin, Johnston, Hollister, Beekman and others have bought out the interest owned by Messrs. Guiberson and Green in the Padre and Neva mines, on Mt. Gleason, and work will be commenced soon on the erection of an addition to their present stamp-mill of five more stamps. This will make the largest mill on the Gleason. These are among the best mines in Southern California, and with proper management, will turn out plenty of bullion. The company will at once put on a gang of men. The Union M. Co. will put in a large pump, and sink farther on their shaft. A little too much water to hoist out by hand. This company has rock that runs \$22 to the ton, and is very easy to get at. Eugene and Bruno Nickel have taken a contract to do the assessment work on the Mammoth mine, owned by Mr. S. Savage of Monrovia, California. This mine is about three miles west of Acton. The New York mill has a lot of quartz on the dump, and when all the machinery is in proper shape, work will be resumed. The Red Rover mine and mill is getting ready for a big run.

Mono.

THE SUMMIT.—Bodie Miner, Dec. 18: Supt. John W. Kelly has put a force of men at work on the Summit. That this mine has been idle so long is a mystery to those familiar with the property. In the flush days of Bodie, the stock was selling on its merit for \$10 a share. It joins the Standard on the east and the Bodie on the north. It has a fine large hoisting works, with all the necessary machinery to carry on an extensive system of prospecting. The shaft is down 600 feet, and the ledge drifted on at the 100, 200 and 400-foot stations. In the upper levels, the ledge is somewhat small and broken, but at the 400-foot level the various stringers unite and form a compact, clean body of ore nearly three feet wide, which assays very high. When this body of ore was first discovered—nearly 12 years ago—it was not considered a paying proposition owing to the high price of milling then prevailing here; but with the reduced cost in that direction, we are now fully convinced that it can be made to yield handsome profits. William Irwin, the well-known mining man, was at one time superintendent of the Summit, and it was his favorite mine, he making the prediction that some day its bullion output would equal that of any mine in the camp. The work at present being done consists in cleaning out and re-timbering the shaft.

THE BODIE CON.—Bodie Miner, Dec. 23: During the past week east crosscut No. 1, 700-foot level, was extended 16 feet. Upraise above the 500-foot level was extended 12 feet. In this upraise there is 12 inches of good milling ore. There were employed 7 miners, 1 carman, and jointly with Mono 1 engineer, 1 blacksmith, 1 assayer, 1 carpenter, 1 laborer, 1 watchman, 1 foreman.

THE MONO.—During the past week south drift, 700-foot level, was extended 7 feet. Upraise No. 2 from above drift was extended 10 feet.

Napa.

TUNNEL.—Calistogan, Dec. 23 When work was resumed on the Sunnyside mining claim, owned by Zell & Simmons, a tunnel was begun in a new place, and has now been extended over 40 feet. It is supposed the ledge will be cut after drifting from 60 to 80 feet farther. The hillside is very steep there, and 100 or 120 feet will give them considerable depth. The old tunnel of the Black Bear mine, in the Pine Flat district, has all been cleared out, retimbered where necessary, and is in good condition for business once more. Many feet of the tunnel had broken the timbers and caved, and of course much hard work was necessary to get it in order again. It was ascertained that the old tunnel had been run just 257 feet. Now that it is open, all work will be done through it. In fact, as the shaft has caved, the tunnel affords the only way into the mine. The tunnel to the Knapp Consolidated mine, in Horn canyon, has been advanced to a distance of 285 feet, and the rock continues very hard.

Nevada.

MERRIMAC MINE.—Grass Valley Union, Dec. 24: Good progress is being made with the new hoisting works on the Merrimac mine. The building is erected and the boilers set, and the next thing will be to place the engines in position. The old tunnel has been reopened, and in a crosscut a vein 15 inches in width has been struck from which quartz is being taken and a crushing is now being made at the Peabody mill. The quartz looks well, and it is found that it is of a paying quality there are hicks of over 100 feet that can be worked. This is not the main vein, however, which the company is seeking to reopen, and which is very strong, as much as 15 feet in places. That vein was worked upon over 25 years ago, and there was a considerable yield of gold, but the shaft was only sunk to the depth of 300 feet, and the bottom level was only opened a short distance. The developments in the Merrimac will be watched with interest, as the probabilities are very encouraging that it will develop into a good mine.

QUARTZ AND GRAVEL.—Nevada Transcript, Dec. 23: A quantity of ore taken by Lord Housman from the recently discovered back ledge at the Sneath & Clay mine was crushed at Locklin's mill this week and gave good returns. The Federal Loan is producing ore faster than the mill can crush it and the stoppers have been laid off this week to give the stamps chance to catch up. The mill that is being built at the Harmony to crush the gravel will be started up next month if no unforeseen delay occurs. Messrs. Stow, Watson, Brand, Marsh and Walrath will soon start to sink a perpendicular shaft on the Yerba Buena claim which adjoins the Fountain Head on the east. The West Harmony Co. has turned its tunnel to the west and in a short time will make an upraise to the channel. Frequent borings made of late have indicated the presence overhead of pay gravel and plenty of it. John and William Kistle and James Russ are opening up the Green Mountain claim between the Murchie and Federal Loan. Their tunnel, which is six feet in the clear and well timbered, is in 75 feet, and it is expected that within 150 feet more the pay chute will be encountered. The ledge, which is from 18 to 25 inches thick, was worked years ago to a depth of 115 feet by Columbus Johnson, the Murchie family, Wm. Kistle, Sr., and others, who took out over \$75,000. The ore paid from \$18 to \$30 a ton, but the miners of those days did not think that rich enough to fool with. The tunnel now being run will tap the ledge 40 feet below the deepest of the old workings.

STRUCK GRAVEL.—Herald, Dec. 23: The Central Co., near the Central House, has struck its gravel and finds it rich. The tunnel, which was run to strike and drain an old shaft which had been sunk to the channel, is found to be too high; but they have struck the gravel and will follow the bedrock down to the shaft, where a pump will be put in to raise the water to this level instead of raising it to the surface. They have a dump, sluices and ditch all in readiness, and hope to get out enough gravel to pay for further developments.

THE PUMPS STARTED.—Supt. Davis has now gotten things in working shape at the Providence. The air compressors and underground machinery are now running, and to-day the pumps were started. Every one will be glad to see the old Providence running again.

RICH ORE.—James Nickerson shows some splendid rock from the Nickerson ledge, on the north fork of Diamond creek. The rock is heavily sulphuretted and fairly alive with free gold. It is probably worth several hundred dollars per ton. Mr. Nickerson says he has three men at work at the mine, which is about half way between the Yuba and Eagle Bird, and that the ledge is eight feet thick.

Placer.

THE DRUMMOND MINE.—Newcastle News, Dec. 25: The Drummond mine, owned and operated by Charles F. Reed, and located between Forest Hill and Iowa Hill, is developing into one of the best mining properties in this part of the State. The shaft or incline is now down 321 feet, and shows an ore body over four feet thick. This whole ledge is producing an average of \$10 per ton, including all the rock that is hoisted out, without culling. The ore carries very little rebellious metal, and the gold is therefore easily saved. The mill has a capacity of 24 tons, and the pay-roll contains the names of 28 employees. The mine has just closed down for the holidays. The cleanup, after a run of ten days just before closing down, showed a yield of \$2100. The present mode of working the mine is more expensive than it ought to be, owing to the fact that all the ore and waste has to be hoisted from the shaft, then hoisted along an incline, and thence to the mill above, which was built on its elevated site at the time the mine was first being prospected. Mr. Reed now has in contemplation the running of a tunnel from the ravine below, so as to tap the mine on the lower levels, and thus cheapen the cost of extracting the ore, and at the same time afford perfect drainage to the mine.

Plumas.

REACHED THE LEDGE.—Bulletin, Dec. 24: From John P. Richards, who was in town last week, we learn that, several days ago, he reached the ledge in the mine at Newtown Flat, owned by Mr. Wormley and himself. The tunnel was driven in 330 feet and it taps the ore vein 140 feet deep. This tunnel has command of about 300 feet of the ledge, with backs of from 140 to 400 feet. The vein is three

feet wide and it prospects well. That section has been rich in placer gold which doubtless came from the quartz veins in that section.

BUTTERFLY QUARTZ MINE.—From H. W. Kellogg of Spanish Ranch, who was in town last week, we learn that Smith & Co. have a prospect for a good mine at Butterfly Valley. Greaves and Maxwell have a contract for running a tunnel, which is now in 260 feet. They have 50 or 60 feet yet to go to reach the ore vein. The tunnel will tap it about 200 feet deep. At other points, the ore has prospected well, and Mr. Kellogg is certain that the vein, which is from 7 to 8 feet wide, will prove to be fine milling ore. Should this operation prove to be the success which is now confidently expected, it will be the commencement of an era of quartz mining in that section. Many veins in that locality will be prospected and others discovered.

Siskiyou.

GOLD.—Yreka Journal, Dec. 23: A man named Burlington has been taking out considerable gold from a rich ledge on Ash creek, a tributary of Klamath river, about six miles below Henley, pounding the quartz in a hand mortar. He realized about \$2100 during the week before last, and the smallest amount realized has been \$600 in a week. The indications are very favorable for the ledge being permanent and not simply a rich pocket. Fowler & Pool also have a very rich ledge on same creek, specimens from which seem almost like pure gold. They will take out a fortune, no doubt, from this claim, even if it should only prove to be a pocket. Parties from the Phil Mott claim and others intend commencing work again in opening river claims above and below Ash creek next spring, and especially at Oregon Bar, where good prospects were found some years ago. James Ironsides of the Cherry Creek quartz ledge realized \$18 per ton from a lot of quartz crushed in the Diggles arrastre at Deadwood lately. He also sent sulphurets from the tailings below for an assay, the returns from which showed a percentage to the ton of \$1,266.26 in gold and \$16.95 in silver, or \$1,313.24 in gold and silver. This ledge is on Deadwood mountain, and extends from Greenhorn creek to Cherry creek. Mr. Ironsides owning three-fourths interest and our City Marshal, Maben, the other fourth. Mr. Ironsides has some other rich ledges on Cherry creek, in one of which F. J. King is interested, but the others are owned by himself alone. The incline at the Willow creek coal mine is now down to a depth of over 300 feet, where a fine bed of coal has been found, measuring four feet in thickness. The company will probably put in a pump soon, as the water coming in exceeds 400 gallons an hour. At present, the water is hauled out by the water cars, four times an hour, the car-box holding about 100 gallons. With a pump, the steam engine can be used in hauling coal cars exclusively. Lee, Lash & Co. of the Greenhorn Creek blue gravel claim have their new shaft down about 75 feet, and expect to strike bedrock in 25 feet more, so as to put in pumping machinery for drainage. They expect to find the blue gravel fully as rich as at the old shaft farther up the creek from the stage road, just south of Yreka. The quartz, placer and hydraulic miners are very hopeful of good success this winter, and during next spring and summer, in mining operations, as the snowstorms already will be the means of supplying a great amount of water in the various streams and ditches for filling sluices and turning wheels of the quartz-mills. We have had more than double the amount of snow already than during last winter, with a likelihood of considerable more before next March, or else rain, which is just as good, from the fact that when raining in the low valleys, during winter, snowstorms almost always prevail in the mountains, where it proves a valuable fountain for streams during the warm spring and summer days.

Tuolumne.

CRYSTALS.—Tuolumne Independent, Dec. 26: Wis Dorsey received by express a diamond which he had sent to San Francisco to be cut and polished. The gem was found in the Eureka mine at Summerville, and is of the kind known as deep water crystals. It is very handsome, Henry Munroe and Tom Birney, owners of the Austrian claim on Bald mountain, near Sawmill Flat, were in town this week, and exhibited some very handsome specimens of crystallized gold. They struck a pocket, a few days ago, and took out a little over \$1100. Hank Gale found a piece of ore worth \$16 in his mine on Jackass hill, Tuesday. Wm. Holmes of Jackass hill struck a bunch worth \$45, on Monday. The drift from the Bonanza slope is now in 65 feet, and is within 60 feet of the west crossing. It may be interesting to distant readers to learn that this mine has produced over \$1,000,000, over \$100,000 having been found in one bunch. The proprietors of this mine seem to have pocket mining down to a science. The mill will no doubt produce largely in the years to come. It is situated in Sonora.

AT ARRASTREVILLE.—Cor. Tuolumne Independent, Dec. 26: The several chutes in the Donella mine are several hundred feet in length. The formation is slate on both walls. There is no machinery of any kind on the mine, but with small capital it can be made a big property. The Blue Lead is in slate formation similar to that of the Donella mine, and it was also first worked in early days, the ore paying well. Some work has been done of late, but owners have not the means to put up the machinery and work it as it should be.

The Uncle Sam mine is looking well. It is hoisted from R. Marshall of Sonoma, by Thos. W. Marshall and sons, Thos. and George. This mine was worked years ago and top taken out and left to cave in and fill up with water. Good reports caused Mr. M. and sons to open it up, and they have a shaft down 90 feet. The ore taken out shows considerable gold, and sulphurets, which assay well; the vein is two feet in width. They have in the past few weeks put up a whim. On the Last Chance mine a shaft has been sunk 50 feet in depth and we are informed that the vein is 18 inches. At the Easton mine, which is in granite formation, the shaft is now down to the depth of 200 feet, and fine ore has been taken out. The vein is not of a large size. There is a hoisting and pumping plant and five-stamp mill in the mine. The Basin Slope mines are idle, but a five-stamp mill has been purchased, and it is said that it will be put up on the mine the coming summer. The Keltz mine is now being worked by an English syndicate. They have a large vein in this mine and in slate formation. They have a ten-stamp mill on the property, and it is said to be

paying well. This mine is situated about nine or ten miles from Soulsville. The Virginia mine has been idle for some time, the owners not having the means to open it.

Ventura.

SANTA PAULA.—Chronicle, Dec. 25: A new rig is completed for No. 13 in Torrey canyon. In the Adams canyon, they have a "crook" in well No. 28, at a depth of 250 feet. In well No. 1, Kenyon claim, the drills are down 1500 feet. Well No. 12 in Torrey canyon is down 500 feet. It has an output of oil of 12 barrels per day. In the Sespe district, well No. 2 on the Los Angeles claim, they are now drilling a depth of 140 feet. They are still fishing for tools in well No. 32 on Tar creek, at a depth of 350 feet, and have a crooked hole also. Charles Maas, superintendent of the ink manufacturing business, is in fine cheer over the prospect of making splendid ink in Santa Paula. At Bardsdale, the oil company's well No. 2 is about ready to begin boring, the derrick and machinery being moved from the abandoned one.

NEVADA.

Washoe District.

IMPERIAL.—Virginia Enterprise, Dec. 24: The raise from the 400 level is up 108 feet, having been made during the week. The top shows quartz having no value.

CONFIDENCE-CHALLENGE.—The joint Confidence and Challenge north drift, 200 level, is in 919 feet, having been advanced 10 feet during the week; face in quartz of no value. The joint Confidence and Challenge north drift on 300 level is in 610 feet, 22 feet having been made during the week; face in quartz of no value.

YELLOW JACKET.—Shipping to the Vivian mill about 35 tons of rock daily. Usual prospecting being done.

CROWN POINT.—East crosscut No. 3, 500 level, has been advanced 34 feet during the week, and is now out a total distance of 34 feet; face in quartz of low grade. The west crosscut from the south lateral drift, 600 level, has been advanced 27 feet since last report, and is now out a total distance of 330 feet; face in hard porphyry.

KENTUCK.—The east crosscut from the north lateral drift, 500 level, is out a distance of 26 feet, having been advanced 13 feet during the week; face in a mixture of porphyry and quartz giving low assays. East crosscut from the bottom of the 1000 level north winze was advanced nine feet during the week, and is out 46 feet; face in porphyry and low-grade quartz. Are still following south on the ore streak from the 1000 level raise, with no change to report during the week.

JUSTICE.—The raise from the east drift, 622 level, was advanced 11 feet during the week. The top is in a mixture of clay and porphyry. The south drift from the top of the raise, same level, was advanced 16 feet during the week, the work making its total length 46 feet; face shows bunches of fair-grade ore. The north raise on the 622 level was advanced 10 feet since last report, and is now up 46 feet. The top is in low-grade quartz.

SEG. BELCHER.—The north drift from the west crosscut, 600 level, is out a total distance of 76 feet. The face is in a mixture of porphyry and quartz giving low assays.

BELCHER.—The raise from the lateral drift, 300 level, was advanced 30 feet during the week. The top is in a quartz assaying from \$8 to \$12 per ton. Are saving from 10 to 12 tons of fair-grade ore per day from the south drift from the 6th floor of the raise above 1300 level.

HALE AND NORCROSS.—On the 1630 level the north drift is advanced 115 feet. East crosscut No. 1, started from the north drift at a point 75 feet north from the station, was extended 20 feet, making its total length 55 feet. On the Sutro tunnel level the south drift was advanced 25 feet, making its total 190 feet. West crosscut No. 1, started from the south drift, 100 feet south of the station, was advanced 15 feet, making its total distance 90 feet. There is no change of importance in any of the drifts or crosscuts since last report. Have sent through the Sutro tunnel 574 cars of waste rock during the week.

SAVAGE.—During the week we have hoisted 697 cars of ore from the 750, 955, 1150 and 1450 levels, and shipped to the Nevada mill 525 tons, and milled 535 tons; average battery assay, \$22.88. We have bullion on hand amounting to \$21,443.62. On the 1450 level we are stopping ore of fair grade from the face of west crosscut No. 1. Have also started an upraise in the ore to connect with the northwest drift, 1400 level. On the 1450 level, at a point in the north lateral drift, 90 feet north of our south boundary, we have commenced stopping ore of fair quality.

CON. CAL. & VA. MINE.—1100 level.—From the west crosscut at a point 530 feet in, a south drift has been started and advanced 40 feet in a porphyry formation. Have extracted a few tons of milling ore from between the east crosscuts Nos. 4 and 5. From the south drift, the southeast drift started from the south drift at a point 40 feet south from east crosscut No. 4 has been advanced 30 feet; total length 105 feet in porphyry and quartz carrying a low assay value. 1500 level.—The incline upraise has been carried up 35 feet; total 55 feet; following a narrow ore streak, and some milling ore has been extracted therefrom. 1600 level.—The various openings on this level continue to yield some ore. 1650.—Have continued to extract ore of fair quality from the drift run west from the top of the upraise carried up 55 feet above the southwest drift. Ore of fair quality has been extracted from the drift run east from the winze No. 3 (down 73 feet) in working upward from that point. 1750 level.—In working out and upward from the bottom of winze No. 2, sunk from the 1650 level, we continue to extract ore of fair quality. Have also extracted some milling ore at the point where the upraise carried up from the crosscut run west from the southwest drift made connection with the slopes on the eighth floor. Have continued to extract ore of average quality at the point where the upraise from the southwest drift 70 feet north from the south line of the California ground connected with the eighth-floor slopes. 1800 level.—The south drift on this level has been extended 10 feet; total length 32 feet; and continues in ore of milling value. There has been extracted from all parts of mine during the week 1043 1440-2000 tons of ore, which was shipped to the Morgan mill. The average value of all of the ore worked at that mill during the week, 980 tons, was \$24.55 per ton. Bullion shipped

to Carson mint, assay value, \$36,710.39. Bullion no hand at in our assay office, assay value, \$12,000.

Pioche District.

IN THE BURKE.—Pioche *Record*, Dec. 19: It is with much pleasure that the *Record* announces the arrival of Mr. Geo. H. Gould of Santa Barbara, Cal., who, in company with Mr. and Mrs. W. S. Godbe, arrived this week. Mr. Gould came to Pioche for the second time in the interests of the P. C. M. & R'd Co. At the time of his former visit, some three years ago, the South Contact vein in the Yuba had been struck, from which some 300 tons of free smelting ore was shipped to Salt Lake, having from 150 to 300 ounces silver and one ounce in gold per ton, and also running high in lead. We are informed that a far more important development has just taken place in the Burke mine, one that promises to give the camp a fresh impetus and add greatly to the richness of the company's future bullion product.

Wild Rose District.

OUTLOOK FOR THE OLD CAMP.—Cor. *Silver State*, Dec. 26: I visited Spring City a few days ago and found the people there hopeful and confident. They are beginning to see a glimmer of light through the darkness that has shadowed that camp for the past three years. T. F. Maley and Mike Menzies have a lease on the Bullion mine and have struck a body of very rich ore, carrying considerable native silver, and which will mill at least \$100 per ton. N. Frayer has opened up the Cliff mine at the south end and has found the ledge there three feet wide of first-class ore, which will mill from \$700 to \$1500 per ton. The ledge is getting wider and richer as they go east, and it looks as if they were running into a large body of ore. It is needless to say that this makes Nick feel very good, which is shown by the fact that he can tell his yarns now as he used to years ago when times were good. Wm. Weighel has a force of men prospecting the Julian mine, which has a good ledge about 2½ feet wide. Half of it is \$150 to \$200 per ton. Mr. Weighel showed me an assay that he had made in San Francisco which went \$200.84. The ledge is getting larger as they go north. The owner says he will increase the force after the first of the year and take out a carload of ore for shipment. There are several other prospects that are looking quite well, and the miners look for a boom in the spring, which there is no doubt they will have, judging from the looks of the mines now.

ARIZONA.

RICH GOLD STRIKE.—Phoenix *Gazette*, Dec. 26: Harry Horseworths came down from Weaver district yesterday. He reports a rich strike in the Piacer diggings up there, and nuggets weighing four and seven ounces are being taken out. A Mexican who had been working in the lower end of the district struck a rich "pay streak" the other day, that caused a general stampede to the spot, and claims were staked off in every direction. There were several hundred dollars of gold dust brought into Phoenix and sold to Goldman & Co.; some of the nuggets brought in weigh six ounces. There have been thousands of dollars of the precious stuff taken out of these diggings in years past, but there has never been such a rich strike as this one made before. There are more men working in the district this winter than there have been for years, and they are all making fair wages. Including Americans and Mexicans, it is estimated that at least 175 men are placing, besides a large number of quartz miners and prospectors, who are meeting with more or less success in their search for the hidden treasure.

DAKOTA.

SOUTHERN HILLS.—Deadwood *Pioneer*, Dec. 20: Titus Corkhill, State Inspector of Mines, returned yesterday from an official trip to the Southern Hills. While there, he visited the Keystone mine, and is enthusiastic over the prospect. He says the character of the ore is similar to the Homestake, only richer. He thinks it will prove one of the best mines in the country. At Spokane and Silver City, he found great activity prevailing. A number of ledges of high-grade pyrites has been uncovered, and the owner feels confident of supplying the basic ores necessary for the treatment of the silicious ores of Bald Mountain and Ruby Basin.

IDAHO.

BEAVER DISTRICT.—Cor. *Idaho Statesman*, Dec. 26: The Elmira mill at Banner is making a splendid record this year, the yield being from 4000 to 4500 ounces silver bullion per week. Beaver district, sometimes known as El Dorado, will be the district to start a boom for this county when spring opens. Silver ore was first found there in 1889, by A. W. Dunn, who recorded five claims on July 5th. He commenced work on them, and during the fall sent a few tons of ore to Banner that milled nearly 400 ounces of silver per ton. A good many locations were made in 1889 and 1890, on 30 of which representation work has been done. The owners of the principal mines in the district are A. W. Dunn, M. H. Kempner, Vivian Thorne, Dr. Southworth, D. W. Brown, Charles Curtis and John Henry. They have done a large amount of work on their claims and developed many wonderful silver mines, as well as several mines on the gold belt, half a mile south of the silver veins. These mines are ten miles southwest of Banner, and in the right direction to be on the same belt. They are on a direct line between the Banner and Summit Flat mines. All of the gulches of the district carry large streams of water the year round, and the finest timber for lumber and mining purposes is abundant; in fact, the mines are surrounded by a dense forest of pine and fir. These persistent and energetic prospectors have done well in developing such a fine lot of mines without financial assistance from the outside. But the time is certainly near at hand when they will reap rich and justly earned rewards.

RED CLOUD MINE.—Wood River *Times*, Dec. 23: The downward continuation of the ore body in the Red Cloud mine was cut into last night on the lowest level. At noon to-day the ore vein showed a width of 10 inches of first-class shipping ore of as good grade as any extracted from the property. This find was made in a crosscut, began the first of October last, to discover the continuation of the vein lost because of a break or fault in the formation. This discovery is of great importance to

the owners, as it enormously enhances the visible value of their property and justifies the hope that the payment of dividends can be resumed ere many months.

LOWER CALIFORNIA.

THE BUTLER MINE.—Lower *Californian*, Dec. 18: Mr. E. A. Brennan, the mining expert, has returned from a visit of inspection to the Alamo district. His main object was to examine the Butler group of mines on Tomasa hill, and he expresses himself as greatly pleased with them. They are, in fact, greater properties than he had been led to expect, but the little development that has been made on them shows nothing more than a lack of ability on the part of men who have thus far had the mines in charge. To illustrate; Mr. Brennan says he saw two drifts parallel with the ledge, and one sink through 16 feet of granite, also parallel with the ledge. He thinks that by proper work the Butler mines, especially the Arabella, will prove to be the richest mines in the camp. His idea would be to strike into the formation to a depth of perhaps 800 feet at which point he is confident an ore body would be encountered. Drifting at that depth would tap most of the Butler mines. As to the camp in general, Mr. Brennan believes that its richness is plainly apparent, though but little development has been made. Mr. Brennan was sent to Alamo by two well-known capitalists of California, with instructions to examine and report on the Butler mines, and we have it on pretty good authority that his report will result in the development of those mines on a large scale.

MONTANA.

WHITLATCH-UNION CONS.—Helena *Journal*, Dec. 23: No mining transaction consummated during the present season is of greater importance than the consolidation under one control of the entire unexplored portions of the Whitchatch, or McIntyre, Union vein of free-milling gold quartz located in the mountains four miles south of Helena. Through unremitting perseverance of Michael Cooney, all the segregated unexplored portions of the original vein, as well as the adjoining properties on the north, west and east, of any present or possible future value, have been acquired, and the statement is understandingly made that the proposition as presented forms the basis of as great a mining enterprise as was ever inaugurated in the country. It is an incontrovertible fact that portions of this vein produced gold bullion to the value of millions, at a time when labor was high and the cost of all supplies was, as compared with to-day, most exorbitant, and it is surely a fact that but a small part of the vein was opened, and that in those portions from which ore was extracted, the vein was not followed to any considerable depth. W. G. Bailey, who is noted for being one of the most conservative business men, has taken hold of this matter, and intends to give it all needed attention until brought to a successful issue. Most careful estimates have been made to ascertain the means required to place the property upon a paying basis, and it has been found that \$35,000 will be ample.

NEW MEXICO.

JIGS.—Southwest *Sentinel*, Dec. 29: Walter C. Hadley, on the Graphic, and U. E. McDaniels on the Flower Queen, are preparing to concentrate the low grade ore at Cook's Peak by jigs. This is a very cheap and thorough way of concentrating and should be generally used throughout Grant county. The old McGregor mill at Georgetown is running along steadily with one full 12-hour shift a day. If more snow or rain fall, the mill will be run continuously throughout the 24 hours. Mr. Bragaw expects to ship two carloads of concentrates and ore next week. The Lone Mountain M. Co. are now steadily sending in ore to Silver City for treatment at the Grant County M. & M. Co.'s works. The Lone Mountain Co. expect to continue their shipments here all during the winter at an average rate of ten tons a day.

SALE.—Another mining deal, consideration \$20,000, was consummated in Silver City on Saturday. Mr. Nestor, representing a New Orleans syndicate, and Philip Bach, Jr., representing the owners, met here and drew up the papers. The property is the Ann Arbor mine on Silver Creek, and is the western extension of the Confidence mine. The new owners will put a force to work at once opening the large vein they have. When they have ore enough blocked out to justify them in so doing, they intend to put up a large mill in which to treat their output. Judging from this (and the test is a good one) the new company is a sound business proposition, and is not intended to be run as a stock jobbing operation, as too many valuable mines in this part of the country have been before.

ST. HELENA.—Silver City *Enterprise*, Dec. 25: A force of men will be put to work on the St. Helena mine, Central district, the first week in next month. The St. Helena is showing one of the largest bodies of ore of any mine in the county.

The Old Abe mine at White Oaks is a bonanza, much to the delight of those who for years have pinned their faith to the camp. It is claimed that in a new strike recently made, that there is a million dollars worth of free milling gold ore in sight.

N. Bell informs the *Enterprise* that he will receive a car of ore every fourth day from the Golden Rule mine, near Dragon Summit, Arizona. The ore will be hauled to Pinos Altos and worked in the Bell & Stephens mill.

Another large mining deal was consummated last Saturday, the Ann Arbor mine at Mogollon, Silver creek, changing hands. The purchase price was \$20,000 cash and a large stock consideration. The deal was promoted and effected through the untiring energy and efforts of Judge Ed. Nestor, of Silver creek. The fortunate locators, Dan. W. Lannan and Philip Bach, Jr., receive a well-earned reward for years of unremitting toil in the mines. The Sunset Mining company, of New Orleans, is the lucky purchaser, and has acquired a most valuable mine. The two veins within the company's ground are known to be among the best mining properties in the west, and the new company bought the property at a small price compared with other properties adjoining, or compared to its real value. There is little doubt of the success of the new venture, and it will, when the mill is built, lend new impetus to the mining business in that section. Development work will be started about January 15th.

UTAH.

THE JUPITER.—Park *Record*, Dec. 27: The Jupiter has been closed down for the winter after a most successful season's run. The lower tunnel was driven until it has reached a total of 862 feet, a large portion of the ground being about the hardest rock ever encountered in this camp. At a point 827 feet from the mouth, the large fissure vein was encountered and crosscut and found to be 28 feet wide, filled with low-grade ore and fine-looking vein matter.

CAMP CROSSCUTS.—Considerable ore is being taken from the upper works of the Alliance and stored. The roads are now in splendid condition for hauling, and the mines are making the best of it, and ore is rolling down in large quantities. It is rumored about town that a wealthy English syndicate is endeavoring to secure control of a large piece of valuable ground in the Park with the intention of forming a stock company and working the same. Business at the sampler has been rushing this week, and if the roads remain good, which they probably will, a night force will have to be put on to keep up with the procession. The McHenry, one of the oldest locations in the Park, again comes to the front this week as a shipper. The Nevada-Northland leasers, nothing daunted by the hung jury in their case, are going to put a force of men at work to prove more fully that they have the apex of the disputed vein. The case between them and the Mayflower folks will probably be called about the first thing next term of court. Prospecting is still the order of the day at the Tybo, all work being confined to drifting for the ledge. The shaft is down 220 feet deep, and in the estimation of several parties who are thoroughly acquainted with the formation of the hill, should be at least 100 feet deeper.

WASHINGTON.

TURNING OUT \$8000 A MONTH.—Okanogan *Outlook*, Dec. 23: The Black Bear is a bonanza indeed. In the shaft, which is now down 110 feet, they have 22 inches of ore that assays 42 ounces in gold, which, rated at \$16 an ounce, would mean \$752 a ton. Enough development has been done to demonstrate the permanence of the ore chute and place the Black Bear among the best properties in the county. Drifting both ways from the 100 foot level continues in the same rich ore as encountered in the shaft. Mr. Silverman took to Spokane this week six bars of bullion, the value of which is between \$5000 and \$6000, as the product of 16 days' run on Black Bear ore. In the five months this little five-stamp mill has been in operation it has turned out on an average about \$8000 a month in gold alone. Besides paying for all development done this season and the expense of putting in the mill, it has accumulated a surplus of funds in the treasury of the company, which will be expended during the winter in developing the mine for a larger output of ore and increasing the capacity of the mill.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING DEC. 22, 1891.

465,690.—VEHICLE SHAFTS—J. R. Brought, Mojave, Cal.
465,755.—WEATHER STRIP—S. R. Deacon, Electric, Cal.
465,494.—FIRE ESCAPE—E. W. Dixon, Forest Grove, Or.
465,615.—REFRIGERATOR CAR—E. T. Earl, Los Angeles, Cal.
465,530.—HOOK—R. L. Kirby, Pomeroy, Wash.
465,624.—HYDROCARBON BURNER—J. R. Morse, Los Angeles, Cal.
465,490.—MUSICAL INSTRUMENT—A. Olson, Mishawaka, Or.
465,491.—TRACTION WAGON STEERING APPARATUS—J. B. Osborne, Daggett, Cal.
465,566.—EXTENSION JOINT FOR URINALS—Jas. Shepard, S. F.
465,769.—STEAM ENGINE—C. W. Tremain, Portland, Or.
465,370.—SPEEDING AND REVERSING GEAR—F. E. Tremper, S. F.
465,738.—EXCAVATOR—J. H. L. Tuck, S. F.
465,741.—HAIR-WORKING MACHINE—G. A. Williams, San Diego, Cal.

The following brief list by telegraph, for Dec. 29, will appear more complete on receipt of mail advices:

California—Hans C. Behr, San Francisco, instrument for measuring units of work done by a machine; Frank C. Colville, Oakland, electric annunciator; William A. Brown, San Francisco, wrapping machine; Henry Elliott, Los Angeles, lock; C. I. Hall, San Francisco, valve for hydraulic elevators; Adam Heberer, Alameda, steam boiler; James L. Henderson, Alameda, motive engine; Charles B. and T. D. Hunt, Winters, truck; Alden B. Kelbarr, Oakland, and C. Young, Sacramento, metallic packing; John C. Look, San Jose, car coupling; George E. Woodbury, San Francisco, ore concentrating machine.

Arizona—Wm. H. Ayres and H. Schroeder, Whipple Barracks, bow-and-stringed instruments.

Oregon—Jonathan W. Hunt, Kirby, memorial burial tablet and indicator.

Washington—Caleb D. Page, Tacoma, dumping trap.

Notes.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

EXTENSION JOINT FOR URINALS.—James Shepard, S. F., assignor to Shepard Bros. No. 465,566. Dated Dec. 22, 1891. In the usual construction of urinals a supply pipe is connected with the upper end of the bowl, which is usually made of earthenware, and the discharge pipe is connected with the lower end, these pipes having sockets, into which the extensions from the upper and lower end of the bowl enter, and are fixed and made tight by means of any suitable cement. Whenever it is necessary

to remove the bowl, or make repairs, the couplings and connections of these pipes have to be torn out, and there is considerable trouble, time and expense in removing and replacing them which this invention is designed to overcome. The extension joint is so made that the bowl may be readily removed without disturbing the connections.

SPEEDING AND REVERSING GEAR.—Frank E. Tremper, S. F. No. 465,570. Dated Dec. 22, 1891. This invention relates to that class of mechanism for reversing the movement of an engine, usually termed "speeding and reversing gear." The object is to provide a simple and effective gear of this class which is specially adapted for small boat engines, in which the driving shaft of the engine may be placed transversely of the boat, and may communicate power to the screw shaft, which is located longitudinally thereon.

Mining Share Market.

The year closes on an inactive market, but at fairly steady prices. By referring to the list of lowest and highest prices it will be seen that fluctuations have been very small, leading persons to believe that the pools are taking in every share of stock possible, while making the market look sick and giving it every appearance that a break is at hand. Points put out are for lower prices and then a big up, but cappers and their tools (fools) do not say whether it is to be a sharp break or a gradual decline.

On Dec. 31st, 1890, sales made on the 9:30 A. M. session of the S. F. Stock and Exchange Board were at the following prices: Alpha 80 cts., Andes 60 cts., Belcher \$1.30, Best and Belcher \$1.90, Bodie 70 cts., Bullion \$2.25, Challenge \$1.40, Chollar \$2, Con. Virginia \$2.10, Crown Point \$1.05, Gould and Curry \$1.25, Mexican \$2.10, Ophir \$2.60, Overman \$1.55, Potosi \$4.80 to \$4.85, Savage \$1.40, Seg. Belcher 80 cts., Union \$1.50, Yellow Jacket \$1.65. In May, or 4½ months afterward, Con. Virginia sold at over \$20 a share, Best and Belcher at \$9.37, Gould and Curry \$4.00, Mexican \$5.37, Ophir \$9.50, Potosi \$4.55, Union, \$5. The Middle and Gold Hill stock did not move up much in comparison to the North End stocks' up move.

It is still claimed in well-informed mining circles that the Bodie mining companies outside of the Standard are not conforming to the laws of this State. The officials of the mines in not doing so are liable to prosecution for criminal negligence, as well as civil suits. Dummy directors, elected through the pernicious proxy system, it is said do not care how superintendents' reports are made so long as they draw their \$5 fees for attendance at called or regular meetings of the directors.

While the year goes out on an inactive mining share market, the condition of the mines were seldom, if ever before so favorable for extracting ore at a profit, so as to allow dividends to be paid, and dividends will be paid, provided mine-losing becomes a thing of the past. No one knows better than those who are members of looking rings, that by the work in the lower levels of the mines, high-grade ore was discovered, and also that in drilling on several levels, it showed an upward continuation. With this knowledge, the mines were flooded, either accidentally or otherwise, which naturally caused outside shareholders to sell large lines of stocks at very low prices, under assessments, and a failure to show up ore. With large lines of stocks on hand, the pools or rings had to devise ways and means to peddle them out at a good round profit, and for that purpose, Con. Virginia was taken in 1886 as a leader, and on its paying dividends, soon after it sold at over \$50 a share. Success crowned their efforts. The result is too well known—assessments levied since by every mining company, excepting Con. Virginia, two dividends by Hale and Norcross, and a few dividends by Confidence. Of course, since 1886 several mines have been and are still being looted to the injury of outside shareholders, but now it looks as if 1892 will witness a forced return to honest mine management and paying dividends from milling ore taken out of the west ledge. Why does not Con. Virginia, Savage, Chollar and other mining companies taking out ore conform to the mining laws of California under which they are incorporated, and give mine assays of ore? J. W. Mackay, in his testimony in the Hale and Norcross suit, admitted that they were a check against looting.

Mining shares opened this morning (Wednesday) inactive but fairly firm. After Call, there was a slight advance, caused by a small buying order for two or more of the Comstocks. The market is very sensitive, and any demand for stocks causes an advance; but after this is met, prices slide off again. In outside mining shares there is very little doing. In the "Razor Blades" (Tuscaroras) and Quijotas there was not a single transaction the past week. There was a short-lived demand for Bodie; what on, no one seemed to know.

The pools and rings' orders, not to let leak out any information of a favorable character from the Comstock mines, are still in force; but notwithstanding this, we are in possession of advices from reliable sources at Virginia that in several of the mines they are opening up the rich ore found to the west. The reticence of the officials of these mines regarding it makes it quite probable that the ore is to be kept for looting, but in this game it is to be hoped they will meet with a Waterloo defeat. In Con. Virginia there is a reported improvement on the 1800-foot level. On the 1100-foot level the reported rich find is kept secret—too far west to answer their purpose. In the other north end mines, developing and exploiting work are still under way. In the middle group, very important work is being done, which, if the mines were differently managed, ought to produce dividends from the ore mined. Potosi officially reports an improvement. A. C. Hamilton, the superintendent of that mine and several others, has begun to take an oath through proxy to the correctness of the weekly reports. Why does he swear by proxy? Is he afraid they are wrong? Proxy oaths are not legal. In the Gold Hill group the important work heretofore reported is still under way. In Alta, on the 1350 level, the large body of ore recently found assayed over \$100 in gold. If the mine was differently managed, there might be quite a boom in the stock.

From the outside mines there is nothing new to report. If official advices from the Quijotas and Tuscaroras are correct, the shares are cheap, provided rings do not get away with the bullion. From the Bodies, private advices are very encouraging,

MECHANICAL PROGRESS.

Railroad Couplers.

One of the most annoying items connected with railroading just at this time is the matter of couplers for connecting cars in long, heavy freight trains. The rapid increase in the length of trains and weight of cars has rendered the draw gear of the average freight car too weak for the work thrown upon it. As a consequence, a large percentage of freight-car repairs is made upon the couplers or draw gear. In addition to the imperfections common to all, there is the additional trouble of the great variety of make. Every railroad seems to have its own preference, and as cars are constantly being transferred from one road to another, the confusion and expense is all the more. Of course, when any defect of this kind occurs to a car on another than its own road, the road on which the break occurs must make the repairs, and the great trouble arises from obtaining a coupling or a drawbar just like the one broken. Of course each road, when a break occurs to a car not its own, will repair the damage in the easiest and most inexpensive manner and send the car along with a "defect card" attached, hoping it may reach its own road before the imperfect substitute gives out.

So great has this trouble become, and so important is it to the security of life and the safety to merchandise, that Congress has been asked to establish some uniformity of couplers—to select some one of the many in use which shall be adopted by all roads.

Senator Onslow introduced a bill into the last Congress providing for the adoption and use of a uniform standard of coupler for all freight trains employed in interstate commerce. This bill provides that all common carriers, whose duties include the coupling of cars, and who are members of established organizations, and their railway employees, may, within six months after the passage of this Act, vote upon a choice of automatic car coupler. Such coupler may be of vertical type; must be so devised as to couple by impact, and dispense with any person going between the cars to couple or uncouple. Every common carrier is to be entitled to one vote for every freight car owned, leased or controlled, and the employees will be entitled in the aggregate to one-third as many votes as may be cast by all the common carriers.

Counting the Votes.

The Interstate Commerce Commission is to have the power to decide the validity of the votes cast if not less than 600,000 votes are cast, and the entire vote for any particular coupler be not less than 500,000. The commission shall certify these facts to the President, who shall issue a proclamation declaring the coupler chosen to be the standard safety car coupler for use in interstate commerce. In case no choice is made the President shall appoint a commission of five competent persons to determine the coupler best to be used. All carriers must equip at least 10 per cent each year of the number of freight cars used, and also equip every engine with a driving-wheel brake. The Commissioners shall invite bids from the inventors of couplers, stating what they will accept from the United States for their patents, and upon the purchase of the patent by the Government the coupler may be used or manufactured by anybody free.

The great difficulty in introducing any new device into railroading becomes very apparent in this instance of the car coupler. A coupler has been recommended by the Master Car Builders which, it appears, is opposed by some labor organizations, not because its use would result in the saving of life, but because it throws skilled labor out of employment, it being held that the old device required skill on the part of the operator, while the new one is practically automatic in its operation. It is just such unreasonable requirements by labor organizations as this that is fast arraiving popular opinion against them. But, aside from any objection on the part of workmen, the introduction of an automatic car coupler presents a serious problem to the railroad companies. If the change could be made on all roads at once, there would be little difficulty in the matter. But as this cannot be, there is the difficulty of coupling cars with all sorts and descriptions of coupling devices, so the whole matter must rest.

PROGRESS IN MACHINERY CONSTRUCTION.

Probably but few have any correct idea of the difficulties which were met with 60 or 70 years ago in making suitable tools and machinery from metal. There were no planing, boring or shaping machines; the turning lathe and the drill-borer were about all the devices which could be called into use by the mechanic of that time. Sewing machines, which play such a part in the manufacture of shoes, could not possibly be made at that time. All inventors had to make by hand the machines they invented, without the aid of other machines in the making of the individual parts. They had to invent some tools so as to be able to make certain parts of their invented machine. When the celebrated English machinist Clement entered a shop as master at London, in 1814, he found the tools so poor and defective that he had to spend days in making such tools as were needed. James Watt, the inventor of the steam engine, could not get his first machines in working order in consequence of lack of some

contrivances. The first cylinder, which he had cast was not tight and was on one end five millimeters wider than on the other. A good cylinder should not show more difference in width than one-half millimeter; and then the cost of work at that time was extravagant. Whitworth, one of the oldest manufacturers of working machines in England, says that the polishing of cast iron cost \$3 per square foot 40 years ago, as the work had to be done by hand. To-day a metal planing machine does better work for 2½ cents a square foot. The first steel pens had to be made by hand. The manufacturer, Perry, paid for the first steel pens \$1.25 a piece, and we often read that steel pens used to cost \$5. But still these pens were not as good in quality as those which are made to-day. After factories had been established, the price of a steel pen was still \$1, then 50 cents, and finally 25 cents, which price was kept up for some time. To-day one can get a gross for that price.—*Metal and Iron Industry.*

AMERICAN LOCOMOTIVES IN ENGLAND IN 1840.—It is quite presumable that the fact is not generally known that there were quite a number of American locomotives in use in England, over 50 years ago. This fact has recently been brought out in connection with the discussion of the relative superiority of the English and American locomotives. It is stated that in 1840, there were in use on the Gloucester and Cheltenham railway in England, twice as many American as English engines, although the first cost of the former, including duty, was somewhat higher. It is to be presumed, therefore, that the American engine of those days was more efficient than the English, and this is all the more interesting because some recent experiments go to prove that the superiority is still maintained. Some of the locomotives turned out by the Baldwin locomotive works are simply magnificent pieces of machinery, and if the compound locomotives of the type built by this works, does what is claimed for it, the American machine will continue to hold its supremacy.

A NEW AND USEFUL MACHINE.—One of the most interesting practical inventions lately put upon the market, is from a knitting machine manufactory in Dresden, Germany, the apparatus in some respects resembling an ordinary knitting machine in its make up. It can be readily employed as such both on round and flat work, but is especially adapted for variegated patterns in their usual diversity. It is capable of working variegated patterns—cardigan stitch, purl cardigan, two-and-two rib, and embodies the peculiarities of a striping machine, producing in one piece of goods single, colored, striped and many-colored patterns, without changing the machine itself. By the simple placing in or out of the back thread in the slotted thread conductor, it is claimed any desired number of colors and shades can be produced, the effect being such as to give the impression that the patterns are the result of embroidery.

THE RUDDER OF AN IRONCLAD.—It is an immense affair. The rudder of the French ironclad *Buenos*, which was recently launched at Lorient, was 18 feet high and 13 feet wide, weighing 17 tons. In transporting it from the shops where it was made, to the shop yard, it was necessary to suspend it between two flat cars, as it could not be placed upon a single car in any position. Even in this position, the rudder just cleared the roadbed, and the arches of the tunnels through which it was necessary to pass. The great rudder was built with an interior framework of wrought steel, iron angles and plates, and covered with steel plates. Great care was required in constructing it, in order to make it perfectly water-tight, for a water-logged rudder would be a very inconvenient and cumbersome appendage to a great war ship.

CHEAPENED FUEL COST IN MELTING IRON.—At the recent meeting of the American Society of Mechanical Engineers, Mr. Webber stated that a considerable saving in the cost of fuel was obtained by melting metal in a foundry cupola rapidly. At the Erie City Iron Works 100 tons of iron was melted per week in a 60-inch cupola, at the rate of eight tons per hour. The ratio of iron to fuel was 7½ to 1. Desiring to increase the capacity of the cupola, an attempt was made to melt 12 tons per hour instead of 8. The result was 11½ tons per hour with a ratio of iron to fuel of 9½ to 1, and 75 per cent of metal went into good castings, or only three quarters of 1 per cent less than with the slow rates of melting.

A NEWLY DESIGNED PULLEY upon which particular attention has been paid to danger from slipping belts, has been placed on the market. On the face of the pulley, at regular intervals, are rubber strips with rounded surface and fastened by projections passing through the rim of the pulley. Not only do these strips do away with slipping belts, but lessen the wear on the latter and reduce the friction to the minimum. When worn out, they can be replaced at a slight outlay.

AN AX is subject to rigid tests before it is pronounced perfect. The steel must be of the required temper, the weight of all axes of the same size must be uniform, all must be ground alike and in various other ways conform to an established standard.

SCIENTIFIC PROGRESS.

Cyclones in California and Elsewhere.

Cyclones of grand dimensions are frequently generated in the zones where the trade wind of the opposite hemisphere penetrates. They are caused by an augmentation or swelling in volume of air, proceeding from the opposite hemisphere, attending unequal distribution of the normal limits of the atmospheric circulation, and determined by the retardation which the trade wind or monsoon meets with in following the sun's movement.

The recent little touch of a cyclone in this city by which a house was demolished and two unfortunate lives lost, brings to the mind of the writer an incident which is said to have occurred near that same locality something over 40 years ago, and before the discovery of gold at Sutter's mill.

An American ship was riding at anchor off the Presidio, over which, at the time, the Mexican flag was flying. One morning, as a gentleman—a passenger—was standing upon the quarter deck, he was surprised by a sudden atmospheric disturbance which originated but a short distance from the ship and upon the water. It took the form of a tornado, or whirlwind, and commenced a movement landward, with a violent whirling motion, and struck the land just west of the Presidio, increasing very instant in violence, until it passed on and over the high ground near what is now Lone Mountain. In its passage, it actually tore up the surface of the ground, filling the air with sand and brush.

The circumstance was first made public by the observer, on a second visit to this State about 15 years ago, through a letter published in one of the city dailies. That letter came under the notice of the writer of this paragraph, who clipped and filed it away. The narrator expressed the opinion that if this city had been built up at the time, as it was at the time of his second visit, not a house could have stood in its track of a hundred feet or so in width.

This incident, and others of a similar character, which have occurred in several localities on this coast within the last 20 years, should be a reminder that California is not altogether exempt from those terrible atmospheric disturbances which occasionally work such havoc to life and property in our Eastern States. One of these California tornadoes occurred near the city of Nevada some 15 or 20 years ago, and passed for some three miles or more through a dense forest. As we now recollect the account, it twisted huge trees as though they had been mere saplings, tearing others up by the roots and making a clean path through the forest, something like a hundred feet in width. Judging from its destructive work, as no human eye saw it, no Kansas or Dakota cyclone ever reached greater violence or destructiveness.

THE ELECTRIC HEADLIGHT.—The use of electric headlights has now become quite general in Indiana, nearly all the roads entering Indianapolis now having several in service. A representative of the *Railroad Gazette* made a trip over the Indianapolis, Decatur and Western, from Indianapolis to Decatur, lately on an engine equipped with the light. Its power is approximately 2500-candle power, and it gives the engine-man a light which on a straight track will often reveal objects at a mile or more, and for fully one-half a mile all objects of the size of a cow can be distinctly seen in ordinary weather. The greatest distance at which an object was seen was 2½ miles. This was a window of a station-house in which no lamps were burning. When the light was first reflected from the window, the appearance was that of a locomotive headlight about a mile away. The window seemed to increase in size until at a distance of about three quarters of a mile, the effect was that of a burning structure. At this distance the outlines of the building could be distinctly seen. These distances were easily computed by counting the telegraph poles, which are 200 feet apart on this road. A water tank was sighted at nearly a mile, appearing much larger than it really was. Bridges with overhead trusses could be seen at half a mile. The highway crossing fences along the line had been freshly whitewashed and with little effort could be seen a mile. Collisions have been prevented by the use of these lights. The expense of running the light is nominal. The demand for steam from the locomotive is small, and the carbons, which last 18 hours, cost but 70 cents per hundred.

LIGHTNING CONDUCTORS.—To the various theories concerning lightning conductors which have been advanced by scientists is now added that of Prof. Rowland, of the Johns Hopkins University, who asserts that the best method is to provide a metal roof with an ample number of metal conductors leading to the ground, serving to carry off the electric bolts from the clouds; copper is the best material, but tin or iron will answer the purpose, and he suggests the placing of the conductors at the corners of a building, so that all parts will be equally protected. Further, lightning has no fixed portion of a building to strike—the stroke may fall at the center of a roof, and, while it runs along the surface of a body, the body may be broken or crushed by the enormous pressure brought to bear upon it, in the same manner that an explosion of dynamite or nitro-glycerine would cause a fracture. The quantity of

electricity in a stroke of lightning, Prof. Rowland remarks, is not nearly so much as passes along almost any electric wire on the street, but the voltage, or electrical pressure, of the street wire is rarely 3000; a volt is the basis on which the pressure is estimated and the voltage of the lightning stroke is roughly estimated at 6,000,000,000 volts—in addition to which appalling difference, it may be said that the current of the wire is constant and continuing, while the lightning dart is delivered in the one two-hundredth part of a second.

NEW METHOD OF PRODUCING MAGNETIC OXIDE ON IRON.—An invention of some importance in rendering the surface of cast or wrought iron proof against rust, has recently been perfected by Monsieur P. Henry Bertrand, Paris-Grenelle, says the *Ironmonger*. The process consists in depositing by one or other of the galvanoplastic methods now in vogue, a metal or metallic alloy, susceptible of volatilization at about 1000° C. After being coated with this metal, the articles are placed in a furnace and heated to 1000° C., or whatever temperature is necessary to secure the volatilization of the coating of metal. Notwithstanding the envelope, the iron particles become oxidized, but without permitting the oxygen to accumulate in insufficient quantity to form sesquioxide of iron. At the same time the oxygen is enabled to penetrate in such quantity as to form magnetic oxide, Fe³O₄. During the process, the metal or metallic alloy becomes volatilized, and after four or five minutes, the magnetic oxide completely covers the objects under treatment. The formation of the magnetic oxide can be produced by the operator at will, and no special skill appears necessary to work the process, but it is, of course, necessary to use the material supplied by the inventor, in the preparation of which a secret composition is probably employed. The oxidation is said to offer a perfect protection to iron surfaces against rust for any length of time.

RETAIN THE INDIAN NAMES.—There should be a revision of many of the names of rivers, mountains, valleys, etc., in California. The outlandish names which have found their way by means of the early comers into this State, into our maps and books and talk, should be laid aside and a new nomenclature adopted, better suited to our present and future civilization. There are many names now in use which are unfit to be spoken or printed. We could probably do no better than to adopt the old Indian names. Whatever may have been the lack of taste and civilization in the aborigines of this State, and the entire country in fact, in their modes of life, they were certainly far in advance of the present inhabitants in their taste for nomenclature. Many of the names they employed may be lacking in euphony to English ears, but they all had either a beautiful or most significant appropriateness of meaning to the localities to which they were applied. The State of Georgia, more than any other State of the Union has retained the Indian names of its rivers and most of them have a musical sound, as, for example, the Ocmulgee, the Obopees, the Ogechee, the Cannonchee, the Oconee, the Chattahoochee, the Altamaha and others. These examples might be multiplied indefinitely.

THE PRESERVATION OF BOOKS.—The paper on books which have survived for two or three centuries, is a very different article from the book paper of to-day. The paper upon which books were printed 300 years ago, was honestly made and durable. No strong chemicals were employed in its preparation. Neither wood, pulp nor clay entered into its composition. It was made by hand and of honest rags, mostly linen; cotton was little used in those days. It was made to last and it has lasted, and will continue to last until most of the book paper of the present day has crumbled to pieces by reason of its inherent decay, induced by the strong acids, the fibrous wood and dusty clay used in its manufacture. The most of the books of to-day, notwithstanding their strength and in every way, superior binding, will hardly hold together a century. Two hundred years hence a book printed during the present century will be something rare indeed. Both the printing and writing ink now used possess a far less enduring quality than that used 150 years ago.

WHY PLANTS GROW ERECT.—Why trees or other plants grow erect has never yet been definitely determined. It has been supposed to have some relation to the action of light. Certainly, a plant usually growing erect turns toward any opening for light in a dark cellar, but when there is no light, they grow erect. Dr. Maxwell S. Masters has recently called attention to some cases in an English coal mine 1000 feet deep. Some props made from green posts pushed out into growth, and though in absolute darkness they were perfectly erect. They were perfectly blanched.

CHEMICAL HEAT.—The North of France Railway Co. is about to experiment upon a method of warming its cars by chemical heat. The heat is to be derived from acetate of soda. That chemical will be placed in boxes in a solid state and then immersed in water at 100° F., thus liquefying the soda. The heat will be obtained by the process of the subsequent solidification of the chemical, which will gradually take place after the boxes have been taken from the water. This process can be repeated continuously, each immersion requiring from five to six hours' time to solidify.

ELECTRICITY.

Petaluma and Santa Rosa to be Connected by Electricity.—According to the *Petaluma Imprint* there is good reason to expect that Petaluma and Santa Rosa will soon be connected by an electric railway. One or two gentlemen from the East are working to this end with one or more citizens of Petaluma. Some doubtful Thomases who asked, "How can you possibly compete with steam?" was simply answered by their showing the proof of one eastern road, about 20 miles long, that had absolutely forced the steam railroad that it paralleled to discontinue its local trains. There are many reasons why this is possible on a road no longer than this will be. In the first place, the power plant to do all the business for both passengers and freight will not be larger than that now used for lighting the city. Eastern experience has proved electric roads of this length cheaper, faster, cleaner and much safer, as the engineer, or brakeman, stands in a glass turret, with a perfect view all around and has the most complete control of his car. The road will handle freight as well as passengers. It is contemplated that the road will, in the near future, be greatly extended from either end—to deep water at the southern end, from which boats will be put on to connect with San Francisco. The time between Petaluma and San Francisco will then be reduced to one hour and a half.

Electrical Postal System.—It is now very generally conceded that the full measure of success in our postal system cannot be attained until the electric telegraph and the long-distance telephone have been made part of our postal facilities, with the pneumatic-tube post as an adjunct. As to the public, the greatest benefit of the tube system is its cheapness. In this connection, we may remark that some of our South American neighbors are quite ahead of us in this important matter. It is announced that an electric railway, 186 miles long, is about to be opened in South America, connecting Buenos Ayres with Montevideo. This, however, is not a surface road, but an overland "telegraph line" and its object is to carry letter-boxes between the two cities. It crosses the mouth of the La Plata, where it is 19 miles wide, and two wires are supported by a tower on each side of the river, nearly 270 feet high.

Underground Wires.—The recent examination of an underground electric cable line which was laid in France in 1885 revealed the fact that 394 faults were discovered in the cable. These faults were investigated and proved some to be caused by lightning discharges, a hole being made in the insulation or the wire broken. In some places long lengths were found to be rotten, the insulation being completely eaten away, and the trough holding the cable being filled with a foul, blackish liquid. Those interested state as their opinion that the trouble is of mechanical origin, which in time developed into a chemical action, which caused the decay of the covering. The fact that the cement varied in quantity at different points leads some to believe that compulsion in the cement conduits is partly to blame.

Electricity in War and Commerce.—Electrical machinery is being rapidly introduced into war practice, both upon land and upon the sea. There is no doubt but that this new agent will come into large and varied use in the warfare of the future, and that it will form a most important factor in deciding future battles. The search light will present an important feature in preventing surprises. One of these light projectors, with one man on the lookout, would take the place of a ship's crew waiting in arms during the long dreary nights in the vicinity of the enemy. The use of electric lights in commerce is of equal or more importance, as has been shown in the navigation of the Suez Canal, and as will also be found in another inter-ocean highway which will soon be navigated at Nicaragua.

Rapid Progress in Electric Work.—One of the most forcible tributes to the genius of American electricians that we have heard of was paid by the head of one of the most prominent electric-lighting companies in the United States by refusing to fill an order for more of a certain staple article than would last two months. The reason he gave was, that in that period the whole system of incandescent lighting might be completely revolutionized.—*Electricity.*

Electricity in Brewing.—It is considered by a writer in the *Brewers' Journal* that the application of the electric light would tend to increase the amount of yeast formed during the concluding processes of fermentation in the brewery.

The California Electrical Society meets the first and third Monday evenings of each month, at the Academy of Sciences building. W. C. Quimby, Pres.; O. Brooks, Vice-Pres.; C. E. Purling, Sec'y; W. C. Crockett, Treas.

An Englishman has patented a compound to be placed on the outside of incandescent lamps. After the current is switched off, the compound remains luminous, so that the lamp can be seen in the dark.

Electricity is now used for heating flat-irons used by tailors.

ENGINEERING NOTES.

Life-Shortening Occupations.—The *Medical Age* contains the following abstract from the *Journal of the American Medical Association*: One of the onerous features of modern life is the extent to which the most hazardous trades are overrun by applicants for work. The electric light companies never find any difficulty in obtaining all the linemen they need, notwithstanding the fact that the dangers of that kind of business have been demonstrated times without number. The men who work in factories where wall paper is made, frequently make one another over the tradition that a man's life, in this trade, is shortened ten years. A similar belief is prevalent in factories where leather papers are made, and among men who have to handle them, and whose lungs are said to become impeded by inhaling the dust arising from such papers. In certain other factories, where brass ornaments and fittings are made, the air is laden with very fine brass particles, which are, when inhaled, especially irritating to the lungs. But one of the most singular advertised calls for employees that was ever printed, appeared recently in a Connecticut newspaper, signed by a firm engaged in the business of building towers. It called for applicants only among those who are young, strong, and courageous, and closed by saying: "We warn all seekers for this job that it is of the most dangerous nature, and that few men continue in it more than a few years. In fact, it is almost certain death to the workman who follows this occupation." The manufacture of white lead is one of the most deadly operations in which men can be actively engaged, when conducted in the usual manner. Quite recently, however, an entirely new mode of manufacturing this useful substance has been devised which is perfectly harmless to life and health.

A Remarkable Ferryboat.—One of the most extraordinary boats on the American lakes is a passenger car transfer ferryboat operated in the Straits of Mackinac by the Duluth, South Shore and Atlantic Railroad. It has an enormous capacity for carrying cars, but its peculiarities are its strength, its shape, and the number of its steam engines. It carries 24 steam engines for the performance of the various requirements of its dolly business. The hull of the boat is as solid as the walls of an old time block house. The bow rises from the water so as to hang or slant over it, as if it were a hammer, and that is what it was built to be. The boat is an ice-breaker, intended to keep a channel open in the straits during the winter, or to make one whenever it is pushed into the massive ice that forms in that cold region. The big boat advances toward the ice, and shoving her nose upon its edge, lifts herself upon it. Then a screw propeller under the overhanging bow performs its work of sucking the water from under the ice to enable the boat's weight to crush it down the more easily. Thus the destructive monster makes her way steadily through the worst ice of the semipolar winters of that region, climbing up on the ice, crushing it down, scattering it on each side and making no more of it than if it were so much slush.—*Iron Age.*

The Great Dam Across the Colorado River.—The great dam across the Colorado river at Austin, Texas, is now making substantial progress. This dam will be, when completed, 1150 feet long, 60 feet high and 18 feet wide at the top. The upstream face is of limestone and is vertical; the downstream face is of granite, and the interior is rubble masonry of small stone and cement. The dam is intended to utilize the power of the Colorado river. The water power will run the electric light plant, furnish power for the electric railroads and for pumping the water supply of the city, and leave a surplus of some 13,000 horse power for the use of factories. It is about two miles above the city of Austin and the natural conditions are very favorable, as the river there runs between high bluffs and the bed is of rock, so that very little excavation is required to find a solid foundation. It will be the largest power dam yet built in this country. The estimated cost of the dam is about half a million dollars.

Curious Foundations.—The *Railway Review* tells of a novel method of laying foundations in swampy soil recently employed by an American engineer. The building to be supported was a low wooden one which it was proposed to use for the storage of machinery. Casks were set in holes in the ground along the line of posts, and were filled to the depth of about one foot with iron turnings. The posts were placed in the casks, which were then filled with iron turnings compactly rammed in place. A solution of salt and water was slowly poured over the turnings, under the action of which they solidified into a hard mass. The heat of the oxidation of the iron was so great that the posts were charred. This also served to act as a preservative, and to that extent, the iron turnings are probably superior to concrete under similar conditions.

Beating the Whaleback.—It is said that a marine engineer of Toronto has constructed a model and drawn plans of a new style of craft which, it is said, will revolutionize the lake carrying trade. It is said to be as far ahead of the patent whaleback vessel as the whaleback is in advance of the old model lake craft of

square build. Redway's boat is fashioned after the model of an Indian canoe. It has a flat bottom, except for a fraction of the keel at the stern to accommodate the rudder. The hull is somewhat after the style of the whaleback. There are no bulwarks. The upper works are meager, being only a cabin at the stern, where the holler and machinery are, and a small protection forward, so that the anchors and cable chains can be approached in any kind of weather.

Utilizing the Tides.—The utilization of the power produced by the ebb and flow of the tides has been made in Havre to work turbine wheels, which generate the power necessary to run the dynamos which furnish Paris with the electric light.

Connecting Paris with the Ocean.—A report of the committee appointed to examine into the merits of a canal from Paris to the sea has just been made public. The canal will be 114 miles long and 21 feet deep, and will cost \$35,000,000.

Wave Power.—Waves exert a force of one ton per square inch when they are only 20 feet high. At Cassis, France, granite blocks of 15 cubic meters have been moved by wave force.

The Deepest Sounding yet made on the coast of Africa was of New Orleans, by H. M. S. Challenger, whose 400-pound lead struck bottom at the enormous depth of 26,700 feet.

A New Style of Bicycle is urged along by an auxiliary power imparted from the handle bar. It is used in sporting and hill climbing.

There are 208,749 railroad bridges in the United States, spanning 3213 miles.

GOOD HEALTH.

Heart Disease.

"Yes," said an eminent physician, "heart disease is common; it is, perhaps, much more frequent than is generally realized, if you take into consideration all the forms of heart disease. The heart, like other organs, is the seat of a large number of diseases, and the expression, 'heart disease' is as indefinite as the term 'skin disease'; it may have a score of different meanings. I am inclined to believe that heart diseases are more common than they formerly were," he continued. "This is due to the great nervous and physical strains which attend our modern modes of living. But it is a great wonder that the heart is not more frequently the seat of disease than it is when we consider its delicate mechanism, its ceaseless labor, and I might add, the abuse to which it is subjected. The heart is one of the most exquisitely constructed machines that can be conceived of. With its four chambers, its four sets of valves, and supplying its own motive power, it toils constantly, faithfully, for its three-score years and ten without rest, without repair, responding to every demand, however unreasonable, until, finally exhausted by labor or degenerated by disease, it is no longer capable of carrying on its function. It falters, then, resumes its work, falters again as if to warn its host that he must be less exacting; again resumes and again falters, until, sooner or later, the last point of endurance is reached and it ceases to beat.

A Tired Heart.

"Did you ever hear of a 'tired heart'?" No one ever thinks that the heart may become fatigued. But it is true, and frequently the fact. The heart is just as liable to suffer from fatigue as is any other muscle in the body. I have never seen it mentioned in the books, but the condition may be recognized almost as positively as any other abnormal state of the organ. A positive diagnosis cannot be made at once in most cases, because of the resemblance of the physical conditions to those present in dilation of the heart. But under rest and proper treatment the heart returns to its normal condition in a comparatively short time, which is almost an impossibility in the case of a dilated heart. Not a few cases of so-called nervous 'prestration' are nothing more than fatigue of the heart.

"Life would be prolonged by a little more attention to the heart; by paying a little respect to the most faithful servant we ever have. A good deal of good might be done, also, if parents would teach their children the danger of overtaxing the heart. They should teach them to stop and rest a few moments during their play when they are able to feel the violent throbbing of their hearts against the chest-wall."

Pedestrians, either amateur or professional, who suffer from sore feet after an unusually long walk, will experience great relief from soaking the feet once or twice a week in a half pailful of hot water, to which a piece of nitrate of potassium the size of a small walnut has been added.

Increasing Use of Patent Medicines.—Thirty years ago the revenue from patent medicines in Great Britain was \$210,000. It now amounts to many millions annually.

A Pasteur Institute was opened June 1st at Saigon, Cochinchina, under the auspices of the French government. The work of the institute will extend over the whole field of microbiology.

USEFUL INFORMATION.

Why Lobsters and Crabs Turn Red.

"What makes lobsters and crabs turn red when they are boiled?" said the observant fish man, in reply to a question. "Well, strictly speaking, they don't. The lobster or the crab is just as red before it is put in hot water as it is afterward, only it is subdued by a mingling of blue in its make up that gives it a grayish appearance. The blue and red of a live lobster or crab are pigments in the shell. As long as they are there together, the red becomes gray. But both of these pigments are not fast colors. The blue won't wash, but the red is there to stay. If it were possible to keep lobsters or crabs alive for any length of time in the sun, the blue would fade out as quickly as the same color does out of a cheap flannel suit, and the shells would be a vivid red, as if they had been hotted. It is not an uncommon thing to catch live lobsters and crabs, more frequently the latter, that are entirely red. It has been determined, however, that this eradication of the blue pigment is the result of disease. Live red crabs and lobsters are never put on the market. So the reason a crab or a lobster turns red, as the saying is, when it is hotted, is because the hot water instantly washes the fugitive blue coloring matter out of the shell and leaves only the fast red. It does not take long holling to change the color. If you were to rescue a lobster from its hot bath two seconds after it is submerged, you would find it as red as if it had been boiled for an hour."—*N. Y. Sun.*

Plowing by Night.—A plan has been adopted by the farmers of Colusa county to gain time by plowing at night, as a means of accelerating fall plowing. The plan is to use a steam plow which can be run day and night over the level farms at the rate of eight miles an hour. It has a traction engine, and tears up the ground in strips 21 feet wide, doing its work much more evenly and thoroughly than the old horse plows. The same appliances are used for combined harvesters and thrashers in the proper season. The engine is equipped with locomotive headlights for night work, and they throw a light in the path in front of the machine. Additional lights throw their rays on the plow, which are placed in a row obliquely from the direction of progress, enabling the machine to turn sharp corners. Ordinarily, an engineer, a fireman and a man to look after the plow can operate this labor-saving device, which plows about 160 acres a day, running continuously, at a cost of 12½ cents per acre, including wear and tear of machinery. Team-plowing could not be carried on for less than 75 cents an acre. The ability to work at night enables a farmer to rush his work when he is pressed for time. The main objection to running at night is the difficulty encountered in having two different crews to run the machine, one by day and the other by night. If anything goes wrong during the day, the night engineer usually falls heir to the difficulty, which the other frequently neglects and makes no effort to repair the damage.

Where Quick Eyes and a Clear Head is Needed.—When a railroad company, says the *Philadelphia Record*, handles as many million tons of coal annually as the Reading does, the question of weighing it becomes a matter of some importance. Skill and long experience have solved the problem, however, and the bulk of the vast coal tonnage of the leading coal-carrying road in the country is weighed on four scales, and then they are not crowded. The weight of the empty car is marked in chalk on the outside. As the car approaches, a clerk takes the number of the car and its weight, the weigher calls out the gross weight, and the difference is the weight of the coal. The cars run as fast as ten miles an hour across the scale, and it is very seldom that one has to be stopped and brought back for reweighing, although that is done when the weigher is at all uncertain about his figures. The men at the scales can generally tell within a hundred pounds or so what a car contains. As soon as they see the class of car coming, they know the number of tons it contains, and have the scale so prepared that only the hundred weights need be adjusted while the car is moving over it. Expert officials of the company can tell at a glance what each class of cars should contain, and if, in looking over the weight sheet, any car appears either too heavy or too light, it is brought back and reweighed.

Exporting Apples to Europe is becoming one of the most important features of the trade. Up to the first week in November, 555,000 barrels had been shipped from New York since the season began. Last year, 195,164 barrels were sent abroad.

Don't Mend Your Gloves with Silk.—It is a very great mistake to mend gloves with silk, as the silk will out the kid much sooner than cotton of equal fineness. All kid gloves are sewed at the manufactory with cotton thread.

Grain Harvesting has been reduced to a fine point in California. A recent report from Stanislaus county shows that it costs just 80 cents per acre to harvest the crop from a ranch of 7330 acres.

TABLE OF CONTENTS.

EDITORIALS.—Huntington's Ore-Feeder; Microscopy Iron; Electric Pumps, 1. Passing Events; Mining Companies' Balance Sheets; The Engine Runner's Catechism; Stockbrokers Organized for Reform; The Miners' Convention; Miners' Resolutions; Working a Paint-Ore Mine, 8.

ILLUSTRATIONS.—Apparatus for Perpendicular Illumination in Microphotography; The Huntington Ore-Feeder; Electric Pump at a distance from Power Station, 1. A Paint-Ore Mine Illustrated, 3.

MISCELLANEOUS.—The Miners' Association of Nevada County; Patents at the Fair; Non-Liability of Employers; Four Hundred Millions; 'Tis All Mineral Land, 2. Yuba County Miners' Meeting; Quicksilver in Napa County; Prospector's Pointers; The Blue-Jacket Mine; Oil in New Mexico; Prospecting in the Mohave Desert, 3.

MECHANICAL PROGRESS.—Railroad Couplers; Progress in Machinery Construction; American Locomotives in England in 1890; A New and Useful Machine; The Rudder of an Ironclad; Cheapness of Fuel Cost in Melting Iron; A Newly Designed Pulley, 3.

SCIENTIFIC PROGRESS.—Cyclones in California and Elsewhere; The Electric Headlight; Lightning Conductors; New Methods of Producing Magnetic Oxide on Iron; Retain the Indian Names; The Preservation of Books; Why Plants Grow Erect; Chemical Heat, 6.

ELECTRICITY.—Petrolina and Santa Rosa to be Connected by Electricity; Electrical Postal System; Underground Wire; Electricity in War and Commerce; Rapid Progress in Electric Work; Electricity in Brewing; Miscellaneous, 7.

ENGINEERING NOTES.—Life-Shortening Occupation; A Remarkable Ferryboat; The Great Dam Across the Colorado River; Curious Foundations; Beating the Wheelback; Utilizing the Tides; Connecting Paris with the Ocean; Miscellaneous, 7.

GOOD HEALTH.—Heart Disease; Increasing Use of Patent Medicines; Miscellaneous, 7.

USEFUL INFORMATION.—Why Lobsters and Crabs Turn Red; Flooding at Night; Where Quick Eyes and a Clear Head is Needed; Exporting Apples to Europe; Don't Mend Your Gloves with Silk; Grain Harvesting, 7.

MINING SUMMARY.—From the Various Counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 4-5.

MINING STOCK MARKET.—Sales in the San Francisco Stock Board; Notices of Meetings, Assessments, Dividends, etc., 12.

MARKET REPORTS.—Eastern and Local Metal Markets; Coal and Coke, etc., 12.

Passing Events.

Our readers should not forget that this number is the first of a new volume of the MINING AND SCIENTIFIC PRESS, and that this is a good time for the renewal of subscriptions.

The storm of this week was very general and brought rain and snow over most parts of the State. People were beginning to fear a "dry year," so that the abundant rain was doubly welcome, dissipating, as it did, all fears of the kind.

The decision of the Supreme Court this week on the subject of making public the balance-sheets and statements of mining companies, is a very good thing indeed. Many of the companies are managed in the interest of directors rather than stockholders. Any one, even the smallest stockholder, should be able to know of the affairs of the company, and under this decision he can.

The outlook is for a very favorable year for California as to most products. If, now, a plan can be carried out to let the hydraulic mines again be worked, always provided no other interest is injured in any way, a long-dormant industry will be rehabilitated. The matter will be thoroughly discussed at the coming Mining Convention in this city.

Mining Companies' Balance Sheets.

In the case of Francis vs. Samps, the Supreme Court of this State, in rendering an opinion affirming the judgment and order of the lower court in favor of the plaintiff has virtually decided in favor of the legality of the mining laws of this State under which mining companies are incorporated.

This action was to recover \$1000 from the defendant, a director of the Yosemite Queen Gold, Silver and Lead Mining Company, a corporation, for omitting to cause to be posted an itemized account or balance sheet on the first Monday of November and December, 1886, and the first Monday in January, 1887, as required by legislative act. The court says: "If the law imposed the duties specified in the act upon the directors of corporations actually carrying on or conducting the business of mining the contention of the appellant's counsel would be unanswerable, but the law imposes such specified duties upon the directors of corporations formed for the purpose of carrying on or conducting the business of mining. The itemized accounts or balance sheets probably would have shown very little, but that little might in some cases be of interest to stockholders. The law under which this case is prosecuted does care for small things. It does not exempt them, and we do not feel authorized to do so."

This decision upholds the correctness of the contention of the MINING AND SCIENTIFIC PRESS for not only a strict observance of the letter of the law imposing specified duties upon the directors and other officers of mining companies, but also that all else should be done calculated to better protection of shareholders.

In this connection, it is not out of place to reproduce the following essential features of the law which are ignored by many of the companies:

* * * It shall also be the duty of the superintendent to file with the secretary a weekly statement, under oath, showing the number of men employed under him and for what purpose, and the rate of wages paid to each. He shall attach to such account a full report, under oath, of the work done in said mines, the amount of ore extracted, from what part of the mine taken, the amount sent to the mill for reduction, its assay value, the amount of bullion received, the amount of bullion shipped to the office of the company or elsewhere, and the amount, if any, retained by the superintendent. It shall also be his duty to forward to the office of the company a full report, under oath, of all discoveries of ore or mineral-bearing quartz made in said mine, whether by boring, drifting, sinking or otherwise, together with the assay value thereof. All accounts, reports and correspondence from the superintendent shall be kept in some conspicuous place in the office of said company, and be open to the inspection of all stockholders.

The law in not specifying pulp or battery assays of the ore milled, but in specifically saying the assay value of all ore taken out, is accepted by mining men not controlled by rings as undoubtedly meaning the mine or car-sample assays. This construction is made more plainly evident when it requires the assay value of all ores discovered. There can be no doubt but the above was enacted into law to protect mining shareholders against mine looting, for as J. W. Mackay virtually testified in the Hale & Norcross suit, it is only by mine or car-sample assays that checks can be placed against the rapacity or misappropriation of bullion by mill-owners.

The Engine Runner's Catechism.

We have received a copy of a new book by Robert Grimshaw, called the "Engine Runner's Catechism," a work evidently of a very practical character, arranged in convenient form and containing a large amount of valuable information essential in every-day operations. It treats more of special builds of engines, as erected, adjusted and run, than of the properties of steam or the general principles of engine design and construction. It gives descriptions of various well known makes of engines, with details of shipping, making foundations, erecting and starting; the adjustment of special makes, each of which has its own peculiarities of construction, often puzzling to engineers of experience. This last feature should prove

specially valuable to young engineers or to those in isolated plants where opportunities for communicating with other engineers or with the builders of an engine are few. The author has made his instructions plain, complete, accurate and up to date. The price of the volume is \$2. It is published by John Wiley & Son and sold in this city by Osborn & Alexander, 401 Market St., who will send it free of transportation for the price mentioned to any point on this coast.

Stockbrokers Organized for Reform.

Over three years ago the MINING AND SCIENTIFIC PRESS began to show up the mismanagement of the Comstock mines, and calling on the directors of the various companies to have the mines worked and the ore milled according to the laws of California under which the companies were incorporated. One of the results of this agitation was the calling into life of the Mining Stock Association, which since its organization has been actively engaged in securing evidence with which to bring suit against the directors of several of the mines. That they met with strong opposition from the stock pools and mill rings only feebly expresses the fierce fight waged, but after many months of hard work, the Association was in possession of enough evidence that funds had been misappropriated to justify their bringing suit through M. W. Fox, an active member of the Association, against the Hale and Norcross directors. The developments in the suit have been a constant source of wonder to the public, how such open, barefaced, mismanagement was possible and the directors not be brought to justice long before this.

The awakening to a realization of the way in which mines are looted is not confined to the public alone, for we find that several of the leading brokers of the San Francisco Stock and Exchange Board have become thoroughly convinced of the rotten condition of affairs and have banded together and propose to bring about the long-desired reform in mine management. This movement, while confined in its membership, embraces those in whom the public can place confidence. They have organized an Executive Committee and will continue their fight at first in trying to secure control or else force the managers to buy stock to keep control of the following mines: Overman, Balcher, Crown Point, Sierra Nevada, Hale and Norcross, and Savage. In forcing the managers to buy enough stock to control the elections, they act on the well-known principle that the former will not, when having control, levy assessments, but work the mines so as to pay dividends. The brokers rightly claim that there are many mines in the Comstock district that can and should be paying dividends were it not for the looting as carried on by inside rings.

So far, the committee's efforts have met with much better results than thought possible in so short a time. This success goes far in proving that there is an earnest desire to down the stock pools and mill rings in the interest of outside shareholders, so that dividends and not assessments shall follow. The brokers fully realize that it is no child's play to not only force the various rings to the wall, and after their efforts are crowned with success to keep a vigilant eye on the workings of the miners, so that it will be an impossibility for other rings to be organized for looting. Much now remains with outside shareholders in carrying to full fruition the program as outlined by the committee, and to get the former to work in harmony with the brokers. The latter have appointed the stockbroker firms of A. G. Garnett & Co., this city, with whom shareholders can consult, either in person or by letter, regarding the move.

The Miners' Convention.

The State Mining Convention occurs in this city on January 20th. Word has been received from about 25 counties which will be represented. It will be the first time in the history of California that the practical mining men of the State have met to discuss their interests. About all of the other important industries have been represented in conventions or associations, but mining comes to the front now for the first time.

That the meeting will be productive of good there can be no doubt whatever. The public is

not generally well informed as to the condition of the mining industry in California, and, in fact, it has been neglected for some years.

The result is the miners have several complaints to make concerning the laws which govern their business. These have been stated in our columns and need not now be referred to. When the Convention meets they will be fully set forth.

It is our opinion that the coming Convention will be composed of an earnest body of men, who will, however, be conservative in their demands. They will plainly set forth those facts favorable to their industry and show, as far as may be, the way by which it may be relieved of many burdens. The people of the State should pay heed to the proceedings and aid in every possible way the miner in his efforts to improve this great industry.

Miners' Resolutions.

There are in this State some men who, because they can see no way by which hydraulic mining can be carried on without injury to the rivers and farming lands, think there can be no way. These same persons "view with alarm" the present efforts of the miners to rehabilitate the hydraulic mining industry.

It is not necessary at this time to discuss the merits of this controversy, which has been going on so many years. There is one point, however, to which attention should be directed, and it is this: In every case where the miners in the different counties have held meetings, and where resolutions have been adopted, said resolutions expressly stipulate that it is the wish of the miners only to resume mining in such a way as to injure no one.

Now, if the miners themselves do not ask to be permitted to resume mining on the old plan of letting the debris take care of itself, and doing what damage it might, no one else is going to ask it. They perfectly realize that they could never again do as they did before; that the debris must be kept out of the rivers and off other people's land; that restraining works of some kind must be constructed; that there must be some official supervision over their work; and that, if they are to run these mines at all, they must be run on a plan which will do no injury of any kind to other interests.

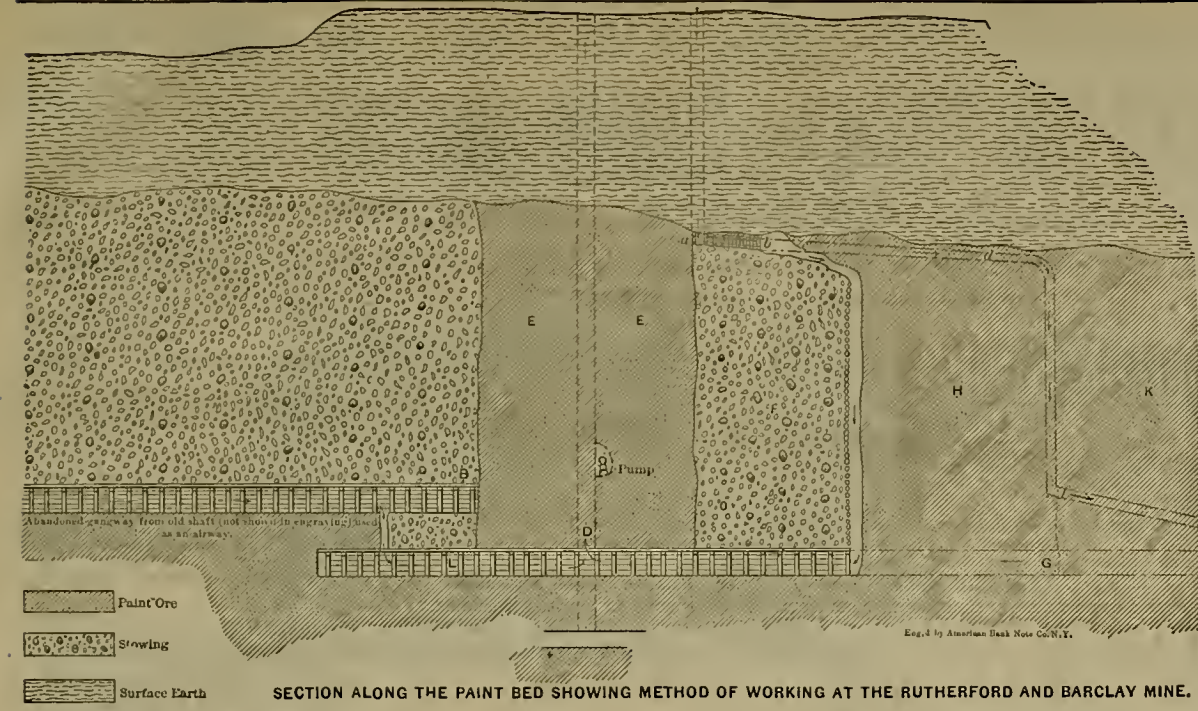

There is, therefore, no cause for alarm among those who are afraid of debris. There can and will be no more of that. If the dams recommended by the engineers are built, and found not to accomplish the purpose satisfactorily, then that is the end of hydraulic mining for good and all.

There is this, however, the miners do not wish those opposed to mining to be any longer the judges of what can or should be done. They want unbiased and unprejudiced professional judgment. They want the Government, after having appointed its own engineer to report on the subject, to take up that report and act on it in some way. They want some sort of adjustment of the matter, by which they can work their mines. But, as stated, they do not ask or expect to do this, when by so doing they will injure other interests. This point should be kept clearly in mind by the unprejudiced public, as well as by those who object to the present movement of the miners of this State.

Working a Paint-Ore Mine.

To increase the durability of paint exposed to the weather, it is necessary to protect the oil with a substance that is itself unaffected by the elements. The so-called "metallo" paints, containing ochre, possess this property, as the small particles of ochre are unaffected and penetrate the pores of the wood or iron, covering the oil and preventing it from evaporating. There are several deposits of this kind in California, more or less worked, but none on a very large scale. At Lehigh Gap, Pa. is a very extensive deposit, which has been worked many years, and it will interest many California miners to read an abstract of the description written for the American Institute of Mining Engineers by C. E. Hesse of Mount Carmel, Pa.

Mr. Robert Prinos discovered this mine in 1856, while prospecting for roofing slate. The low melting point rendered the ore worthless for metallurgical purposes, but the properties of some of the calcined material indicated its value for making metallic paint. Mr. Prinos worked the deposit and his success led other firms into the business. Mr. A. R. Bass succeeded Mr. Prinos after the latter's death, and manufactured "Prinos's Metallic Paint." The principal firms now engaged are the Prinos Brothers and Rutherford & Barolay, who con-

trol the paint supply of this region.

Along the outcrop of the paint, the beds are covered by a cap, or overburden, of clay, and by the decomposed lower portion of the Marcellus slate, which is 50 feet thick at the Rutherford shaft. This slate is very hard and is quarried at a few places, notably near Millport.

The paint bed is not continuous throughout its extent. It is faulted at several places; sometimes it is pinched out to a few inches, and again increases in width to six feet. The ore is bluish-gray, resembling limestone, and is very hard and compact. The bed is of a lighter tint, however, in the upper than in the lower part, and this is probably due to its containing more hydraulic cement in the upper strata. The paint ore contains partings of clay and slate at various places. At the Rutherford shaft, there are fine bands of ore, alternating with clay and slate, as follows: Sandstone (hanging wall), clay, ore, slate, ore, clay, ore, clay, ore, slate, ore, cement, slate (footwall).

The method used in mining is a variation of panel work. Nearly the same system of working is employed by all of the companies who have developed their mines either by means of tunnels or shafts. Tunnels are preferred whenever equally convenient, because they involve no expense for pumping and hoisting machinery, fuel, repairs to machinery, etc.

The following description of the operation of the Rutherford mines is typical of all the workings in the vicinity:

The Rutherford tunnel is six feet high and 600 feet long. The gangways are driven along the footwall on the cement side, six feet high, and are heavily timbered and lagged at the top and on the clay side. The sets of timbers are 3½ feet apart, and usually of nine-inch timber. The width at the top is 3½ feet, with a spread of five feet at the bottom, the extra width being out from the clay. Where the cement rock is firm, the collar is bitched six inches into it, and supported by a leg on the clay side. The cost of the timber is 54 cents per set, including the lagging. The monkey gangway, which carries the air along the top of the breast from the air-shaft, is 2½ feet high, 1½ feet wide at the top, with a spread of 2½ feet at the bottom. Wooden rails with a gauge of 18 inches are spiked to the cross-ties. The cuts represent a section along the bed, and a section

SECTION ACROSS THE BED, RUTHERFORD AND BARCLAY MINE.

KILN USED BY RUTHERFORD AND BARCLAY.
S. Sandstone Casing. F. Firebrick Lining. a. Charging Hole. b. Door by which charge is drawn.
c. Fire place. d. Ash pit.

tion taken across the bed, show the method of timbering the gangways. The old shaft now used as an air-shaft, and the connecting gangway to B (middle out) were driven some years ago; the ore above this gangway was taken out, and the mine was abandoned. The shaft D was afterward sunk, and the gangway connecting with it was driven.

The gangway is not driven continuously, but after being driven about 55 feet on either side of the shaft, the breasts are started 25 feet from the shaft, a pillar E being left to protect it. The breast is then opened up to the face of the gangway, and when one ore-breast F is worked out, the gangway is driven ahead about 30 feet to G, and a new breast H is opened and worked out before commencing a third. The air-hole is first driven to the surface, then the breast is opened to its full width of 6 feet. The thickness of the bed of ore here varies from 4 to 6 feet, depending upon the thickness of the partings of clay and slate. The clay and slate are left on the bottom, which is left sloping to allow the ore to roll down to the chute, which is 6 feet wide and 4 feet long and heavily timbered. Small props or sprags are hitched into the cement and wedged with a lid on the clay side to prevent falls of rock.

The holes are drilled by hand in the clay partings. They vary in depth from 1 to 4 feet, and the charge of dynamite is varied correspondingly, according to the amount of ore it is desired to throw down. The loose ore is wedged down with crowbars and picks, and is then freed from any adhering clay and thrown down the chute. It is then loaded into boxes holding about half a ton each, which are pushed to the shaft on a truck. The ore boxes have four rings at the corners, to which are attached four chains, suspended from the wire hoisting rope. At the top of the shaft the boxes are detached and placed on a truck, which is run to the dump. Thirty cars, averaging 15 tons, are extracted in a day of two shifts, the day shift working nine hours and the night shift eleven. The pay of the miners is \$1.25 per shift. The cost of mining the ore averages \$1.75 per ton.

Natural ventilation is relied upon. The air hole is timbered and has an area of 2 by 2½ feet. In every case the monkey gangway, a, b, c, (upper cut) is carried along the face from air shaft. The manner in which the third breast, E, would be ventilated, is shown by means of the lines a, b, c, d, e, f, g. The stowing is packed so closely that there is little leakage after the roof settles. The air shaft is the in-take, and, after passing through the breasts and gangway, the air goes, as shown by the arrows, to the hoisting shaft, where it is warmed by the steam pipes, and a strong upward current is caused. The east gangway, L, is ventilated by the old gangway leading from B to an abandoned shaft.

The ore as it comes from the mines, is free from refuse, great care having been taken to separate slate and clay from it. In the working places, it is hauled in two-ton wagons to kilns, which are situated on a hillside, for convenience in charging. The platform upon which the ore is dumped is built from the top of the kiln to the side of the hill. The ore is first spalled to fist size and freed from slate, and is then carried in huggles to the charging hole of the kiln.

The slate, when burned, has a light yellowish color, which would change the color of the product. The lower out is a front elevation of the kiln and two sections at right angles to each other. The kiln is 22 feet high and 16 feet square on the outside. The interior is cylindrical, 5 feet in diameter, with a firebrick lining of the best quality. The interior lining slopes from the fireplace to the door by which the charges are withdrawn; this facilitates the removal of the calcined ore. The casing is of sandstone, 5½ feet thick, and tied together with the best white oak timber. When charged, a kiln holds 16 tons of ore, and the kiln is kept constantly full. The heat passes from the fireplaces—of which there are two placed diametrically opposite each other—through a checker-work of brick into the center of the charge; The charge is withdrawn by a door in the front wall two feet long and 18 inches high. The fire is kept at a cherry-red heat, and about one cord of wood is burned every 24 hours. The kiln works continuously, calcined ore being withdrawn and fresh charges made without interruption. The ore is subjected for 48 hours to the heat, which expels the moisture, sulphur and carbon dioxide. About 1½ tons of calcined ore are withdrawn every three hours during the day. The outside of the lumps of calcined ore has a light-brown color, while the interior shows upon fracture a darker brown. Great care is necessary to regulate the heat so that the ore is not overburnt. When this happens, the product has a black scoriaceous appearance and is unfit for the manufacture of metallic paint, and is extremely hard to grind.

The calcined ore is carried from the kiln in wagons to the mill, where it is broken to the size of grains of corn in a rotating crusher manufactured by W. F. Mosser, Allentown, Pa. The broken ore is carried by elevators to the stock-piles at the top of the building, and thence by chutes to the hoppers of the mills, which grind it to the necessary degree of fineness. Elevators again carry it to the packing-machine by a spout and it is packed into barrels. The total cost of preparing the ore, including mining, transportation, burning and grinding, averages \$5.75 per ton. The total waste is between 600 and 700 pounds in a long ton.

A Great Repository of Practical and Scientific Information.

One of the Fullest, Freshest and Most Valuable Handbooks of the Age. Indispensable to Every Practical Man.

NOW READY.
Price \$2.00.

Free of postage to any address in the world.

THE TECHNO-CHEMICAL RECIPE BOOK.

Containing Several Thousand Receipts, covering the Latest, most Important, and most Useful Discoveries in Chemical Technology, and their Practical Application in the Arts and the Industries. Edited chiefly from the German of Drs. Wackler, Elener, Heintze, Mierzinski, Jacobsen, Koller, and Heintzling, with additions by Wm. T. Brannit, Graduate of the Royal Agricultural College of Elders, Prussia, and Wm. H. Wahl, Ph. D. (Heid.), Secretary of the Franklin Institute, Philadelphia, author of "Galvanoplastic Manipulations." Illustrated by 78 engravings, one volume, over 500 pages, 12mo, elegantly bound in scarlet cloth, gilt, closely printed, containing an immense amount and a great variety of matter.

Price \$2.00, free of postage to any address in the world. *32* A circular of 32 pages, showing the full Table of Contents of this Important Book, sent by mail free of postage to any one in any part of the World who will furnish his address.

TUSTIN'S PULVERIZER.

ENGINES AND BOILERS

OF ALL KINDS,
Either for use on Steamboats or for use on Land.
Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries
OF EVERY DESCRIPTION.

Boiler Repairs Promptly attended to and at very moderate rates.

AGENTS FOR THE PACIFIC COAST FOR THE
Deane Steam Pump.

SPECIALTIES:
Corliss Engines and Tustin Ore Pulverizers.
Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

—MANUFACTURERS OF—

MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.

MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.

MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.

Tustin's Pulverizer
WORKS ORE WET OR DRY.

DEANE STEAM PUMP.

FRISBEE-LUCOP MILL CO.,

—MANUFACTURERS OF—
Centrifugal Roller Steel Mills,
FOR PULVERIZING ORES, WET OR DRY,

For Amalgamation or Concentration, and for Manufacture of Cement, Fertilizers, Paint and all other purposes for which grinding or pulverizing is required.

SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHES.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Olohe Cases, free of cost, by applying to the manufacturers.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Dec. 31, 1891.

The year closes with business on a sounder basis than for years past. High prices for cereals and feedstuff, and fair remunerative prices for the large crops gathered from the orchards, have contributed to this desired result. There is not an industry but feels the revivifying effects of the improved markets for farm products. The large crops, and a promise of still larger crops in 1892, are stimulating railroad and other improvement building. This naturally gives iron workers more orders, which, with cheaper raw material, ought to bring about better times for them. The local money market is easy, with further ease looked for on and after the middle of January. The disbursements in January will be the largest in the financial history of the State. In this (December) month the dividend disbursements by local corporations aggregate \$582,250, against \$424,620 for the like month in 1890. The mining companies' dividends, and not one paid by a Comstock mining company, aggregated \$313,000, against \$156,200 in December, 1890.

Eastern mail advices are of a very flattering character, and unless all signs fail, they point with unerring certainty to a large speculative craze in 1892, particularly in railroad securities. At the close of 1890 there was general depression, stringent money, scant railroad earnings, large gold shipments, derangement caused by a new tariff, and other causes of discontent, but now the New York banks are able to report a surplus reserve exceeding \$19,000,000, a condition of strength rarely equaled; excellent crops burden the railroads beyond their ability to transport, and earnings are correspondingly increased; wheat is going out of the country at the rate of 5,000,000 or 6,000,000 bushels a week, and early in the new year an enormous corn crop will be coming forward, much of it available for export. Besides, there is no end of cotton. For the week ending with Dec. 19th, the eastbound shipments from Chicago aggregated 120,000 tons, against 80,000 tons for the corresponding week in 1890. The enormous volume of the grain movement is further indicated by the fact that at last advices no less than 125 miles of track at Chicago were filled with loaded cars, and that the Burlington road alone had 2200 cars waiting to discharge. The effects are already seen in the receipts of gold from Europe, amounting to \$28,000,000 since the return movement commenced, early in September. A confident belief prevails that imports will soon be resumed in considerable volume.

MEXICAN DOLLARS—The market does not show any particular change. Quotations are still given at around 75 cents.

QUICKSILVER—Receipts the past week aggregated 333 flasks. The combination quote \$47. It is said that slightly lower quotations can be obtained from an outside party.

SILVER—The market has shown an unusual degree of steadiness. The markets at home and abroad partake of a waiting character; both producers and dealers seem to be waiting the action of Congress. It is quite generally believed that a free coinage bill will be passed at an early day by Congress, but which will be vetoed by President Harrison, provided the bill is not confined to the output of the mines of this country. It may be that both political parties will enact into law a more favorable bill, so as to take the question out of the coming presidential election. If this proves to be the case, then we may have passed and approved a bill covering everything required by bimetalists.

BORAX—The market is quiet but steady. Eastern advices report slightly lower prices.

LIME—Receipts the past week aggregated 6462 bbls. The market is steady at current quotations.

LEAD—There is nothing new to report in our market. Eastern mail advices report more activity with the market slightly firmer.

TIN—The market is very dull, with quotations altogether nominal. Eastern mail advices report the market dull but fairly steady. London cables to the Iron Age, Dec. 24, report "pig fairly firm with quiet buying. Plate is quiet, but high-grade Ternes met with very fair demand, and several makers are now booked three months ahead on that class of product. Bessemer coals of odd sizes were the most active, however, and a number of forward contracts were secured at 125 6d at Wales, against 125 2d for ordinary 14x20."

IRON—For parcels on spot, on passage and for shipment the market is reported strong, with some holders asking an advance for special consignments. English cables report a slight advance for Scotch warrants. New York advices report a firm market.

COPPER—The market is quiet but steady. Iron Age reports the New York market as follows: There is some evidence of a turn for the better in the temper of the market. The improvement has the support of a very fair amount of new business and numerous inquiries from consumers for 30 to 60 days' supply at prices at which there seemed to be very little chance of doing any business a week ago. A few purchases at 10 1/2c to 10 3/4c appear to have cleaned up the cheap lots of Lake Superior ingot, temporarily at least. Bids of 10 1/2c are now freely made, in some instances for good-sized lots. At 10 1/2c a number of sales have been made, which price seems to be the lowest that any of the mining companies will now accept for either prompt or future deliveries.

COAL—Imports the past week aggregated as follows: Nantamio 1500 tons, Coos Bay 750; total 2,250 tons. This is the smallest import in any one week we have any recollection of reporting. It is doubtless largely due to heavy storms at sea. The local market continues oversupplied. The consumption is quite large and steadily increasing for household purposes.

AN IMMENSE SHEAR—In a steel mill at Newburn, England, is a machine that will shear an ingot of steel 30 inches in width and 12 inches in thickness. A mighty foot holds the ingot in place, and the knife descends and snips off a piece as a boy onto a dandy. Hydraulic power is used, and the cut can be made in about three seconds.

THE LINK BELT MACHINERY CO. of Chicago, whose advertisement appears in the pages of this journal, have lately reduced the prices on their Ewart Detachable Link-Belt, all sizes, nearly 50 per cent from former prices. This concession on the part of the manufacturers of this widely known article will no doubt be hailed with delight by the ore-producing trade, who have been large users in the past of elevating and conveying machinery made by this firm.

Eastern Metal Markets.

By Telegraph.

NEW YORK, December 30.—The following are the closing prices the past week:	
Silver in London.	New York.
Copper.	Lead.
Tin.	
Thursday.....	43 1/2 10 3/4 4 2/8 19 85
Friday.....	43 1/2 10 3/4 4 2/8 19 85
Saturday.....	43 1/2 10 3/4 4 2/8 19 85
Sunday.....	43 1/2 10 3/4 4 2/8 19 85
Tuesday.....	43 1/2 10 3/4 4 2/8 19 85
Wednesday.....	43 1/2 10 3/4 4 2/8 19 85

Quicksilver is steady. Tin is fairly steady. Lead is dull but held at easy prices. Copper advanced slightly but closed weak. Borax is a shade lower. Iron has a strong tone.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. C. HOAG—San Francisco.
R. G. BAILEY—San Francisco.
GEO. WILSON—Sacramento Co.
J. H. CROSSMAN—Perris, Cal.
CHARNICK A. DAYTON—San Lucas, Cal.

SHEET IRON PIPE

ALL SIZES, FOR GAS, STEAM AND WATER.

— WE MANUFACTURE —

SHEET IRON AND STEEL PIPE,

ALL SIZES.

For Water Supply, Mining, Irrigating Purposes, Stock Ranches, Etc.

Made in Lengths Desired from 16 to 30 feet.

The Cut shows a Section of Three Joints

DOUBLE RIVETED SHEET IRON PIPE.

In the manufacture of this Pipe, we use only a high grade of annealed Charcoal Iron of great tensile strength. The weight or thickness of metal used, is graded according to service required, and pressures to which the Pipe will be subjected.

FOR ALL UNDERGROUND PURPOSES, we immerse the Pipe in a bath containing a special mixture of ASPHALTUM, BITUM and PETROLEUM, at a Temperature of 300° Fahrenheit. It thus receives a thorough coating, both inside and outside, rendering it impervious to the alkalies of the earth, rust, etc., and is practically indestructible.

CORRUGATED

CORRUGATED IRON,

Black, Painted and Galvanized, for Roof and Sides of HAY BARN, DRY HOUSES, STABLES, ETC.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 2000 IN ACTUAL USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

THE PELTON WATER WHEEL CO.

121-123 MAIN STREET, SAN FRANCISCO, CAL., U. S. A.

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

Manufactured under Patents of April 27, 1880;

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Concentrating Belt manufactured in San Francisco; we can therefore fill all orders on short notice. The length and width of these belts are the same as is used on the Frue or Triumph Concentrating Machines, but can be made of any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth.

amount of salt needed for proper chlorination is added before the pulp enters the cylinder.

The furnace is entirely mechanical and continuous in action, and consists of a long cast iron cylinder, made in sections to facilitate handling and transportation, and is lined at the mill with firebrick throughout its entire length. Several courses of these brick project beyond the others, so that in passing through,

gears and pulleys. The fire-box is placed at the lower end of the cylinder, flame passing directly into it; and, as the pulp passes through from the upper end, it is subjected to a gradual increase in the intensity of the heat until it is discharged into the bin under the fire-box. At the bottom of the bin the pulp passes through an opening onto a cast-iron table, over which heavy iron scrapers slowly move, discharging

sary for the success of their operations that millmen should have close knowledge of the true condition of the material they are working; otherwise it is all speculation, and can but be compared to groping in the dark, with a faint hope of stumbling upon the right treatment.

It is now generally believed that all gold, except that chemically combined with tellurium, exists in a metallic state in metalliferous veins or lodes. In some of the oldest works on metallurgy the same opinion was entertained. For instance, in "Baron Ingo Boen's New Process of Amalgamation," published in 1791, he says: "Bergman, whose name will be immortal in chemistry, and whose opinion may be taken for that of all the chemists together, sets forth that mineralization requires the presence of a menstruum, which, dissolving the metals, deprives them of their form and appearance; and all the other combinations of metals, as likewise the disguises of native metals in different sorts of stone and matrices, are but so many different mixtures. From these ideas, very naturally arises that common division of metals into native, (nativa) disguised, (larvata) and mineralized (mineralizata).

In a note at the end of the same section, he says: "I use here the name of gold ores without employing the least idea of their mineralization or calciform state, which, in my opinion, never exists. I mean to express that gold particles, small and indivisible, are disguised in them and wrapt up in other minerals."

Richard Kirwan in his "Elements of Mineralogy published in 1796" absolutely denies the mineralization of gold, and says: "Gold being incapable in low heats of uniting with pure air, sulphur, arsenic or any acid furnished by nature, it is plain it can never be mineralized in the strict sense of the word."

We have quoted from these old authorities to show that the question of gold ores is by no means new.

FULTON IMPROVED WHITE ROASTING FURNACE, WITH AUTOMATIC DISCHARGE AND MIXER.

Ore-Drier and Roasting Furnace.

The style of revolving ore-drier shown on this page is almost entirely used in dry-crushing mills, handling large amounts of ore. It is used for drying the ore as it comes from the mine, and after being crushed by the rock-breakers, taking the place of cast iron dry floor-plates. The cast-iron cylinder is made in sections and of a larger diameter at the fire end than at the opposite, into which the ore is fed. This being the case, and the axes of the cylinder being horizontal, as it slowly revolves, the ore gradually travels toward the fire end and is finally discharged into bins ready for being crushed dry in the batteries. Shelves, running lengthwise, are attached to the inside of cylinder, by means of which the ore is raised as cylinder revolves, and is dropped through the flame, which materially assists in drying the ore. The cylinder is driven by gears, as shown, and is supported on four rollers.

The other engraving represents the White roasting furnace with improvements made by the Fulton Iron Works of this city (manufacturers of both these devices). The improvements added to the original furnace greatly facilitate the handling and adjusting of the cylinder, and also the discharge of the roasted ore from the bin. The ore from the batteries is elevated into the hopper shown above the furnace, and is from there taken by a conveyor and fed into the upper end of the cylinder. The

the pulp is raised by the turning of the cylinder and showered through the flame. As will be seen, the roasting cylinder has a slight inclination, and is supported by and revolves upon four sets of rollers. The distance at which these rollers are set apart determines the inclination of cylinder, and consequently the inclination can be varied at pleasure, as will be seen in Fig. 2. As the frames carrying the rollers are supported in trunion bearings, they at once adjust themselves to the angle of the cylinder. This change in the inclination of the cylinder of course directly affects the length of time the pulp is retained in it, and the pulp can in this way be roasted for a longer or shorter period, as may be necessary.

Motion is given to the cylinder by means of

the ore into a mixer or tank, in which stirrers thoroughly mix it with water, which is here introduced, and is then led to pans in a pipe or sluice. The speed with which the scrapers move across the face of the table can be adjusted to suit the discharge from furnace. The dust carried out of upper end of cylinder is collected in dust chambers having their sides inclined to the foot of an elevator, by which it is carried up to hopper above furnace, and again goes through with the ore.

Mineralization of Gold.

On page 27 of this number of the PRESS, is an article on the occurrence of a natural sulphide of gold, which is of more than passing importance. It would seem absolutely neces-

REVOLVING ORE DRYER FOR DRY CRUSHING MILLS.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Certain Ore Deposits.

[Written for the PRESS by W. H. STORMS.]

In Southern California and Arizona is a class of ore deposits which seems to be confined, in the United States at least, to this southwestern section. The deposits to which I particularly refer are those which occur in igneous rocks, and which are of the type that Mr. Geo. F. Becker has so aptly denominated "chambered veins."

While these ore deposits are somewhat similar, geologically, their mineral contents and other characteristics are so distinctly separate as to entitle some of them to particular mention.

One of the most interesting of this class of ore deposits occurs in the

Lava Beds District.

About 35 miles east of Daggett, in San Bernardino county, California, and is commonly known as Halberg's gold mine. The extreme richness of some of the ore from this mine attracted considerable attention two or three years since and led to considerable work being done on the deposit in question and others in the district.

The mine is situated in a rugged, verdureless desert mountain range, on one of the outer ridges, and may be approached to within a few hundred feet by wagon-road.

The entire mountain region, as far as I observed, is composed of igneous rocks, the main mass being aenitic—a uniformly fine-grained rock of light-gray color.

Traversing this formation are broad dykes of a later diorite, accompanying which are smaller intrusive masses of a fine-grained, dark, basaltic rock, having a rusty brown color where exposed, but dark-green where unweathered.

The aenitic rock and the diorite resemble each other somewhat at a casual glance, but a closer inspection reveals a very decided difference in their appearance. The diorite is decidedly porphyritic, containing many small crystals of feldspar in a fine-grained, greenish-gray ground mass, while the aenitic has a decidedly granitic structure, containing no uncrystalline ground mass. It is in one of

These Intrusive Dykes of Diorite

That the Halberg mine occurs. This particular dyke has a strike north of east and south of west. Since the intrusion of this igneous mass, dynamic forces have been at work in the region and extensive fracturing and faulting has been the result. The Halberg dyke, as I may call it, has been faulted along the direction of its strike for several hundred feet, and it is along this fault plane that the ore deposition has taken place.

The faulting of the dyke has been accompanied in places by an extensive crushing of the adjacent country rock on the hanging-wall side of the dip. In these crushed zones, ore deposition has found superior conditions. Several of these chambers of crushed and broken rock occur along the plane of the fault, and in each instance, ore deposition to a greater or less extent has resulted.

The "Ore Chambers"

Consist of masses of crushed and brecciated fragments of the diorite, portions of which still show the original porphyritic structure of the rock.

The ore of the Halberg gold mine is a somewhat unusual combination of minerals, which are very evidently the secondary products of what were originally sulphides, together with native gold, which constitutes the chief value of the ore. These minerals are hematite, limonite, magnetite, malachite, azurite, crysocholla, cerussite, wulfenite, chloride of silver and thin incrustations of antimonial oxide and holok manganese oxide, the latter in apangles and flakes.

In these zones, or chambers, the diorite has undergone an extensive process of metamorphism, resulting in most places in a complete physioal and mineralogical change. The diorite has by replacement given place to solid ore, or has been alloyed to a dense quartzose rock, while in other instances kaolinization seems to have been the result, though to a limited extent. Concerning the

Origin of These Ore Deposits

There seems to be little reason to doubt that they were derived from circulating mineral waters, which in passing through the diorite dissolved the mineral constituents of that rock mass and carried them in solution to the ore-chambers formed by the fault, where ascending, or descending, or possibly both, they concentrated in the crushed zones, forming "chambered veins," those localities being the most favorable to ore deposition—the large exposure of rock faces, and particularly the crushed portions of the zones, affording superior conditions for the metasomatic interchange of mineral atoms.

In the pulverized or finely crushed portions the ore deposition has been the most complete, entirely replacing the original rock; while in the brecciated parts the ore occurs more in the nature of incrustations, or impregnations, more or less completely filling the interstitial space and extending into the rock masses themselves.

The principal ore body is something over 100 feet in length, varying in width from 20 feet near the central portion to a few inches at either end, and also thinning out in depth, resembling a great plano-convex lens, the upper portion having been removed by erosion. Along the fault plane the line of demarcation between the ore and the country rock is very distinct, but on the opposite side of the ore body the mineralization gradually gives place to the normal diorite, changing by insensible gradations from ore to barren rock.

The ore has a most striking appearance, exhibiting the brecciated structure clearly, the fragments being colored various shades of green, white, pink, red and brown or yellow. It would make a beautiful ornamental stone, as it takes a high polish.

Another Peculiarity of this Ore

Is its deceptive nature as to value. One may select two pieces as much alike as possible, as far as may be seen, and one will perhaps assay \$500 a ton and the companion piece not more than \$5. Some of the ore has returned assays over \$3000, which gave little indication of its extreme richness physically. The average range of value, however, is between \$20 and \$40 per ton, an ounce of gold usually being accompanied by an ounce of silver. In one shaft high assays in silver have been obtained, the ore containing comparatively little gold, though this ore did not differ essentially from that of other portions of the deposit in appearance.

In the same district, about a thousand yards distant from the ore deposit above described, is another notable occurrence of ore deposition, which in some respects is a counterpart of the Halberg gold mine, though entirely unlike it in many important features. Here, too, the ore deposit occurs in a dyke of diorite along a line of fracture, the origin of the ore being similar in every respect to that previously described, the deposition of the mineral from circulating waters and the substitution of ore for diorite, as at the gold mine.

Here the Faulting

Seems to have consisted of several parallel fractures, and a consequent displacement, and fracturing and crushing of the rock mass included between the outer planes of the fault, the width of the zone varying from six to ten feet, and at one place 14 feet. Within this space the ore deposition has taken place, in some instances extending entirely across the fractured zone and at others limited to one of the interior faulting planes. As ore deposition has been not extended beyond the limits of the outer planes of fault, it has resulted in giving the ore body the appearance of a fissure vein with walls, the fault planes within the bounding "walls" being plainly discernible, still further carrying out the impression of its being a true fissure by giving it a banded structure.

While undoubtedly the vein is of the fissure type, it is not the "true fissure" of the textbook—an ore deposit occupying a preexisting crevice. Doubtless the fault plane extends to great depth, though longitudinally it can only be followed by a succession of ore deposits similar to the one in question. They are separated, however, by several hundred feet of barren, unchanged diorite, no line of displacement being visible.

In this mine, the ore is almost exclusively silver-bearing—rock assaying 60 ounces silver, carrying but two-tenths or three-tenths ounces of gold.

Its Average Value

Is about \$20, and at the time of my visit, about \$16,000 was standing in eight in the mine. The variety of minerals is confined almost exclusively to the oxides of iron, yellow, red and brown. Lead and copper occur very sparingly, and the ore where oxidized is perfectly free, the silver being in the form of chlorides.

At a depth of 70 feet from the surface croppings, the ore shows considerable change, the porous oxidized material giving place to some extent to a siliceous close-grained rock, which in appearance resembles a siliceous felsite. This rock is doubtless the ore in its normal condition, as it is thoroughly impregnated with fine crystals of iron sulphide. Doubtless at a few feet below the point mentioned, the oxidized ore will give place entirely to this low-grade cherty sulphide rock. The same change occurs at either end of the ore bodies—a gradual replacement of the ore by the siliceous rock and a gradation into the diorite.

There is little reason to expect the occurrence of rich accumulations of oxidized ore in depth, as a thorough draining and oxidation of the ore seems to be the essential characteristics of ore of value, and these conditions cannot obtain in depth.

The Richness of the Surface Ores

Is due entirely to the decomposition of the sulphides, and the concentration of the minerals in the soft, porous portions of the deposit, a large portion having perhaps been derived from that portion of the deposit which has been gradually removed by erosion—as the decomposition went on the mineral solutions continued deeper and deeper into the rock beneath, forming concentrated masses of considerable richness.

The Miners' Convention.

EDITORS PRESS:—One breathes freer when he reads of the contemplated Miners' Convention, to be held Jan. 20th. It is not little in itself, still it shows that the miners of this State have awakened, and are not going to allow their rights to be so overridden by courts and Government officials without an unmistakable protest. All credit to Placer county. A State organization will consolidate the mining interest of the State into business shape, through which efficient work can be done. The miners' power is daily on the increase, and if times raid the business community and granger much harder, the mining fraternity will increase at a fast rate.

The loss of \$100,000,000 to California business circulation means a great deal. That our gold product must be increased, or we are on the eve of a financial crisis, is apparent to every business man. The whole country is growing too fast for the metallic output, and especially the output of gold. Our per capita circulation is too small for the amount of business, and the power that he in finance say silver must not be coined, except as it is supported by gold. Shut out the further supply of gold, then what? Even the granger, who has his farm so heavily mortgaged that he sees no clear road open for the payment of principal and interest, will soon awaken to the folly of his opposition to an equitable adjustment of the present difficulty.

But my purpose when I took up the pen was to say, in advance, that the coming convention being the first, and as there is likely to be a very large body of representative men present, that there should be brought before the body not only matters pertaining to the question of working hydraulic and drift mines, and the land question, but other matters should be considered pertaining to the advancement of mining, all of which could be made interesting and instructive. The silver question should receive due attention. In other words, don't have a one-idea convention. ALMARIN B. PAUL, Dec., 1891.

Miners' Wages and Silver.

The following suggestive paragraphs are taken from the annual report of Supt. Shockey, of the Mount Diablo M. & M. Co., Colomhus district, Nevada.

Prior to 1835, miners' wages in Candelaria had been \$4 per day, the price of silver having been for the years before that between \$1.14 in 1830 and \$1.14 in 1834. In 1835, silver began to go down, and in July of that year the price was \$1.07. At this time the companies operating in this camp decided that they could pay miners but \$3 per day, and the mines closed down. In September of the same year the miners accepted these terms, and the companies resumed operations. This rate of wages was paid till August, 1890, when the price of silver, which had averaged 99 cents to 1886, 98 cents in 1887, 94 cents 1888 (dropping to 91 cents in May of that year), and 93 cents in 1889, advanced to \$1.21 per ounce, and the miners demanded that their wages be raised to \$3.50 per day, and as the companies could well afford the increase with silver at that price the request was granted. Since that date silver has been almost uniformly declining, and it has been nearly impossible for the companies to make any profit under the existing conditions, and under these circumstances it was thought best to offer the following scale of wages to the men, which was done on Nov. 24, 1891:

"In view of the continued low price of silver the Directors of the Mount Diablo Mill & Mining Co. and the Trustees of the Holmes Mining Co. have decided to offer the following scale of wages to the miners in their employ. To take effect on the first day of December, 1891:

"The amount of a day's pay shall be fixed on the first day of each month, and shall be based on the average price of silver for the preceding month.

"When such average shall be \$1.07 per ounce or more the day's pay shall be \$3.50.

"When such average shall be less than \$1.07 per ounce the day's pay shall be \$3.

"Should silver go to par (\$1.2922 per ounce) the day's pay shall be \$4."

The scale was rejected by the miners at a meeting held on Nov. 27th, at which they passed the following resolution:

"It was moved and seconded that we, the miners of Columbus Mining District, shall not work for any mining company for less compensation than three dollars and 50-100 (\$3.50) per day."

Under the instructions of the Directors I closed down the mine down on the night of Nov. 30th, and placed the mine in charge of watchmen.

The Holmes mine is also closed down, and there are now no miners working in the camp.

VEGETABLE FLANNEL.—Germany contains a number of establishments engaged in the manufacture of flannel and similar textiles from pine leaves, the articles made being used in hospitals, barracks, etc., owing to the fact that no vermin can lodge in them. When spun and woven, this material resembles hemp, and it may be employed in making many articles of wearing apparel, as the goods are comfortably warm and solid.

New Almaden Mines.

Brief History of a Great Mining Property.

The famous quicksilver mines of New Almaden are located about 15 miles south of San Jose, in the Santa Cruz mountains. The company own 7800 acres of land, and the history of their ownership is not uninteresting. From the earliest times of which the Spanish traditions speak, the site of the present mine was a favorite resort of the natives who used the vermilion there found for the ornamentation of their bodies. The first attempts at reducing the ore itself were probably made in 1545, and were of the rudest and simplest character. In 1847, the firm of Barron & Forhea of Teplo, Mexico, became the owners of the mine, and its extensive operations began in about 1850. As the ore was exposed and the importance of the deposit understood, a great flood of litigation began and continued for many years. During the years between 1858 and 1861, the mine was closed by an injunction issued during this litigation. In 1864, the various contests were adjusted by purchase and compromise, and the whole property passed into the hands of a single company. In 1870, the mines came under the management of J. B. Randol, to whose skillful and able conduct was due the great prosperity in succeeding years.

The annual reports of the company, says the San Jose Mercury, from which we take this article, tell the whole story how the company up to the year 1870 encountered disaster, and had then accumulated an indebtedness of \$1,600,000, and bankruptcy seemed imminent. By a supreme effort, the company raised a final \$200,000 on preferred stock, and J. B. Randol, who had for years been secretary of the company at New York, was sent to the mine as its manager, and the company entered upon a prosperous career. Its business has been conducted with intelligence, skill and economy, and its directors, recognizing the rights of stockholders, whose trustees they are, give them the fullest information, so that each may know exactly how their property is being administered, and where his money goes.

The quicksilver industry of the world is confined to very few hands. The three most important mines in the world which have been worked up to the present time are the great Almaden mines in Spain, the Idria mine in Austria, and our own wonderful mine at New Almaden. The affairs of the foreign mines are conducted in the secret manner which generally prevails abroad, and which is still (although the fact is to be regretted) largely practiced in some American mines. This secrecy is nominally "for business or trade reasons," and consequently the New Almaden Company could have found an unusually good excuse for following the same course here. The company, however, has made no secret of its receipts and itemized expenses, and, as a consequence, perhaps, it has been one of the most economically managed mines in the world.

Compared with the results attained at the Spanish Almaden, the California work demonstrates the value of intelligence in workmen, and the superiority of the plan of frank and open business methods over the old methods of mystery, which come still apparently believe to be necessary to the successful management of affairs in mining enterprises. Too much praise cannot be heaped upon Mr. Randol, the manager of the New Almaden mines, for demonstrating these wholesome truths, and for the clean and able administration of his trust.

The great Almaden mine of Spain is said to have been discovered 400 years B. C. and has been in course of profitable development for 22 centuries, and is now thought to contain enough quicksilver to supply the entire world for the next 50 years. It is the most perfect deposit of metal of any kind ever discovered, and after all these centuries of operations still remains the richest mine in the world.

The Idria mine in South Austria, was discovered at the close of the fifteenth century. Next to the Almaden, this is the richest mine now known, the bottom of its lode showing no diminution either in the quantity or quality of its ore. For 63 years ending in 1880 its average yearly profits were \$164,000. Its reserves of ore are estimated at 900,000 flasks of seventy-six and one-half pounds each.

These two mines are respectively owned and controlled by the Spanish and Austrian governments, and worked for their account; their policy always having been wise and conservative in producing only sufficient metal to supply the demand at good prices, having large reserves and invariably holding their surplus products for a good market. These facts about the Spanish and Austrian mines have been cited that a comparison may be made with the New Almaden Mines conducted under liberal management upon American principles.

The entire underground-workings that has been accomplished in the Spanish mine can be comprised in a rectangle 700 feet long, 350 feet broad and 1027 feet deep, while from 1864 to 1891 the records of the New Almaden show that the number of feet of drifting and sinking in the mine amounted to 47,822 miles, which does not include the excavation made in extracting the ore during the period named, while the ground opened up the previous period from 1850 to 1864 amounts to 15 miles more.

The records show that in 1835 eight times the amount of material was extracted from the American mine that was taken from the Span-

ish mine in 1883, its production, however, averaging only 20 pounds of quicksilver per ton for that year, while the Spanish mine's production was 200 pounds per ton; that the average number of tons handled for each worker in the Spanish mine was only 6.23 tons, while at the American mine there was extracted over 63 tons per worker, or ten times the amount extracted in equal time; that the cost of production of the Spanish mine was .27 of that of the American mine. It costs no more to extract and reduce rich ore than poor, and were the American ore equal in richness to the Spanish, the production of the American mines would have been ten times as great, and cost \$2.64 per flask. Add for flasking \$1, and we have \$3.64 as the cost of production, as against \$7.10 in the Spanish Almaden and as only 425 men were employed in the New Almaden mines, as against 3126 in the Spanish, it forms a striking illustration of the benefits to be derived from intelligent and well-paid labor, and from skilful and economical management.

The excellence of this management is not confined to economical production of mineral, but New Almaden, in its care for its workmen, providing for them hospital, club-room, reading-room, and everything tending to elevate them, intellectually and morally, offers an example well worthy of study and imitation. The population has been about 2000, the majority of whom were foreigners, principally Cornish and Mexican. Nearly 500 men were employed in the mines until recently.

The land on which the town is built belongs exclusively to the mining company, and only such persons as are desirable are permitted to rent or occupy any of the cottages. The outer portion of the town, where the postoffice, express office, hotel, stores, etc., are located, is an open town, but beyond this is a gate through which none are allowed to enter without a permit. This rule was established to prevent the carrying of liquor to the miners. The town is in reality two towns, known respectively as Almaden-on-the-Hill and Hacienda. The upper town is around the shafts of the mines, and the lower town about the reduction works. The lower town is exceedingly handsome. A clear stream from the mountains is carried along the main street, from which water is obtained to irrigate the tasteful flower gardens which surround the pretty residences. Over-arching trees furnish a grateful shade, and shrubs and plants in luxuriant profusion beautify this mountain town, which lies 1700 feet above tide water. The stately mansion of the superintendent is called the Hacienda. The town is approached by a good road rising in easy grades, from various points of which superb glimpses of the valley are obtained as it winds its picturesque way about the rugged hills. Taken as a whole, new Almaden is one of the most interesting mining communities in the world.

The earnings of the New Almaden mines from Jan. 1, 1871, to Dec. 31, 1890, were \$14,597,875.47, while the operating expenses were \$9,367,356.89, leaving profits of \$5,230,518.58. Of these profits a million dollars have been expended in California in real estate, improvements and necessary legal expenses.

The production of quicksilver at the New Almaden mines is less for the year 1891 than in any previous year of their existence. The product in flasks containing 76½ pounds quicksilver each, is shown monthly in the following table:

	Flasks
January.....	850
February.....	814
March.....	857
April.....	963
May.....	800
June.....	700
July.....	645
August.....	620
September.....	500
October.....	500
November.....	450
December.....	426
Total.....	8000

If we add these 8000 flasks to the 916 459 flasks previously produced, we have a total of 924,459 flasks as the output of these mines since they were opened in 1850.

Men must die and so must mines, and it now appears that New Almaden is approaching the end of its long and prosperous career, for its ore has largely fallen off, both in quantity and quality, until, in order to keep expenses somewhere near receipts, many men have been recently discharged and expenditures reduced to the lowest possible limits at all points.

Butte County Miners.

On the 28th ult. there was a meeting at Oroville of miners and those interested in mining, and the following were selected as delegates to attend the State Mining Convention: W. C. Hendrick, N. A. Harris, C. F. Lott, Col. F. McLaughlin, E. B. Price, John Gale, D. K. Perkins, John Hemesley, W. E. Duncan Sr., H. V. Rearden, C. G. Ferguson, S. McClellan, A. Ekman, L. Laaster, G. O. Hunter, W. H. Fowler, C. C. Balding, W. J. Herrin, E. W. Fogg, H. P. Stowe, J. Morgan, John Wagner, Jo. Hendley, Wm. McIntyre, E. McGrath, J. P. Woods, L. Burwell, A. P. Frary, Wm. James, C. J. Nickerson.

Among others, the following resolution was adopted:

Resolved, That the Butte county delegates to the State Miners' Convention are hereby instructed to use their influence to procure a joint convention of the miners and farmers of the State, to be held at such a place and on

such a date as may be agreed upon, to adjust the differences existing between the two great industries.

On motion of H. V. Rearden, the following committee was appointed to draft a call for a permanent Miners' Association in Butte: W. E. Duncan Sr., E. B. Price, T. W. Reese, C. F. Lott and J. Patterson.

Develop the Waterways.

We are glad to see that propositions for improving our watercourses and supplementing them with navigable canals where necessary are attracting more attention than formerly. The truth of the claim that water is the natural protection against the extortion of rail-owners should be made the most of, has always been acknowledged in a perfunctory manner, but, like other truths, it is of little account until men begin to act upon it. Just now the time seems to be auspicious for a more thorough discussion than has yet been had, also for adopting plans of action involving State and Governmental appropriation and assumption of individual obligations, which shall result in facilities for water traffic wide-reaching and effective.

There should be general and systematic action on this subject, including little streams and sloughs reaching from our bays into productive regions, and including also great schemes for bringing the most remote interior valley points into water communication with tide-water wherever there is water to float a barge and land rich enough to fill it with produce. Of course, all this perhaps cannot be done in a generation, but fortunately some very great undertakings can be accomplished within a reasonable time and with a reasonable expenditure of funds. Why should the great Santa Clara valley and its thriving city of San Jose be dependent for outlet of its produce upon three lines of rail all owned by one company, while a short canal would make it a port upon one of the grandest bays in the world?

It is fortunate that the great San Joaquin valley is awakening to the fact that its vast industries and splendid future should not be controlled by one single track railway. Other railways are talked of, it is true, and there should be others, and yet the possibility of water traffic nearly the whole length of the valley is within reach at quite a moderate cost. We have been interested in reading a good article on this subject in the *Fresno Central Californian* of Dec. 26. It speaks at length of the productive capacity of the region, to show that a waterway composed of rivers, sloughs and canals, could be made profitable as a business enterprise. It then outlines a plan by which the work could be accomplished, as follows:

The canal is a public enterprise, and we believe should be built and maintained at public expense. San Joaquin, Stanislaus, Merced, Fresno, Tulare and Kern counties should unite in building and operating the canal, and thus secure the greatest possible benefits to the citizens of these counties. A tax should be levied upon all the taxable properties of the six counties to construct and equip the canal, and a Board of Directors, consisting of one member from each county and one at large, to be elected by the people, should manage the traffic. Rates can then be fixed so as to derive a revenue barely sufficient to meet operating expenses, and low freight charges would be permanently guaranteed to the people of this valley. Estimating the cost of building the canal at \$6500 per mile, and its total length from Stockton to Bakersfield at 220 miles, it would require \$1,430,000 to construct it. The taxable property in the six counties above named is upward of \$165,000,000. A direct tax of 92 cents on the \$100 valuation would yield \$1,435,000 in a single year, or enough to build the entire canal; but there are other favorable circumstances to be considered, the first of which is that the river channel can be used with slight improvement from near Stockton to Firebaugh's, a distance of say 75 miles. Any expense necessary for the improvement of the river channel should be covered by Congressional appropriation, and in all probability would be. Then there would remain only 130 miles of canal to be actually constructed, allowing for 15 miles of deep water in Tulare lake. Twenty-five miles more between the lake and the river would only require the deepening of the present channel of Fresno slough, so that the actual expense of constructing the canal would not in all probability amount to more than 120 miles at \$5500 per mile, or a total of \$780,000. A direct tax of 50 cents on the \$100 valuation in the six counties would yield this amount. To make the tax as light as possible, however, it might be advisable to collect only one-fifth each year for a term of five years. That the people of the six counties to be benefited would voluntarily tax themselves for this purpose we believe goes without question, hence the *Central Californian* will advocate making the great San Joaquin valley canal a public enterprise.

We do not undertake to say that this would be the best way to carry out such an undertaking, that is a matter for consideration. At the same time, the figures, which we take it for granted are reasonably accurate, show that it would not be a difficult matter to make the whole San Joaquin valley independent of railway domination and extortion, which is now the chief barrier to its progress. Such subjects as that taken up by our Fresno contemporary should be inquired into by all public journals and public-spirited individuals. This question of relief by water for extortionate railway charges will yield to discussion and to cooperative action, and such force should not be denied it.

THE SMALLEST TREE that grows in Europe is the dwarf willow. When at maturity, it is only a few inches high.

The Local Coal Market.

We are indebted to I. Stenart for the following review of the local coal market for the past year:

The total receipts of coal in California during 1891 exceeded those of any previous year, with the result that the total average cost of fuel consumed in this State represents during the past year something in the neighborhood of \$1,700,000 less than in 1890. This saving means much to a locality so heavily handicapped for want of natural resources of fuel for its manufactures.

It is of great moment to this State that the taxation to which its people are subjected should cease, a taxation not home or felt to any similar extent by any other State in the Union. I refer to the Government duty of 75 cents per ton on foreign coal. During the past decade our State has paid, directly or indirectly, to the Government, probably not less than \$12,000,000, and with our increased growth it will, for a like period in future, pay much more. We need for our manufacturing industries, railroads, steamships, etc., a class of fuel that the domestic coal mines on the coast cannot supply. We want cheaper fuel for our homes. This is a question that affects every soul in this State, and its import can be grasped by even the dullest minds. The removal of this tax (a distinct burden on California), should be demanded in no uncertain tones of our legislators, and the result of the coming national election in this State may probably hinge on the position assumed by either of the political parties in regard to this matter.

Turning now to the prospect of the future, it might be said that, judging from the fluctuations in value experienced every year, it is impossible to prognosticate, with any degree of reliability, what the range of prices will be. The new year will commence with Australian coal for shipment at a cost, landed here, duty paid, of \$7.12½, English coals at say \$7.25, but for what period these prices will be maintained depends so much on our new wheat crop, the demand for tonnage in other countries, the condition of European grain markets, and other contingencies, that an attempt to prophesy would be the merest guesswork.

Underlined is a comparative statement of the imports of coal into this port only. The imports of coke were 35,150 tons.

The deliveries of coal at San Pedro and San Diego were about 125,000 tons, 75,000 at San Pedro and 50,000 at San Diego.

A Peruvian Reduction Process.

One of the most frequent of obstinate ores met with in Peruvian mining is blende, containing sulphate of zinc, which has hitherto baffled all known methods of reducing. The inventor of a new process, Sr. Don Pedro Felix Remy of Lima, has, we are informed on good authority, recently demonstrated before a competent assembly of experts in that city his discovery, which possesses almost the same importance as the system of amalgamation discovered by Medina in 1557, which enabled America to supply the world with its treasures in gold and silver. The reduction is accomplished by means of a reactive which the inventor has not yet disclosed, but the mechanical part of the operation is conducted in the following way: The ore is reduced to a powder by means of stamps; it is then calcined in a furnace, where the sulphates and antimony are volatilized. It is then placed in a barrel mixed with the reactive; small quantities of iron and quicksilver are then added. It is then rotated for a space of eight or ten hours. The quicksilver having become amalgamated with the silver, is taken out and filtered through chamola leather and the gangue separated. The silver is then reheated and cast into bars. In the last trial, 427 grams of silver were extracted from 350 kilos of ore, or 99 per cent of the silver contained. There was no appreciable loss of the mercury. The estimated cost of refining by this method is 23 sols, or £3 9s. per cajon of 3 tons, or £1 3s. per ton of ore. No further recommendation of its advantage is therefore required. This discovery will, it is expected, prove of immense value to Peru and greatly benefit the mining industry, and it may be mentioned that the great Orahuacra vein in the Yauli province, which is reckoned the third richest in the world, is chiefly composed of this ore, containing 20 marcos of silver and 10 per cent of zinc.—*London Mining Journal*.

ORDNANCE FOR THE MONTEREY.—In the Ordnance Bureau it is learned that the turret armor for the Monterey is ready for shipment to San Francisco at any time. Her great guns are also ready, and the Pennsylvania Railway has undertaken to transport them across the continent. The task is one of magnitude, as a 12-inch rifle without carriage weighs 56 tons and the carriage weighs 25 tons. Specially constructed cars will be necessary for the transportation of these great masses of metal, and much nice calculation respecting curves, tunnels and strength of many bridges between

the Washington and California Navy-yards have been made to insure the safe delivery of the guns. These guns are not only intrinsically valuable, but their loss at the present time would be a serious calamity, as many months would be consumed in making guns to replace them.

A Great San Diego Enterprise.

The opening of the Linda Vista and Otay Irrigation Districts in San Diego county has been brought about by the development of the Mt. Teocote Water System, by which 100,000 acres of these mesa lands, extending from the Sweetwater river on the north to the Mexican border line on the south, are to be reclaimed.

Leu B. Harris, Jr., the mining engineer, gives the *Chronicle* the following particulars of the great work done in the neighborhood of these districts:

"It was thought impossible to float the mesa lands until within a few years back, when it was found by a party of investigators, of which I was one, that the Cottonwood river might be diverted from its course through Lower California, and made to cover over 100,000 acres. Surveys proved that the water of the Cottonwood could be brought through Dalzura Pass, distant 30 miles from San Diego to Jamul valley, and thence by way of Janal Meca into San Diego itself, if necessary. This led to the planning out of the Mount Teocote system.

"The pioneers were: J. F. Sinks, Vice-President of the San Diego Bank of Commerce; J. W. Young, H. P. Whitney, G. H. Mulfield, D. D. Maynard, T. E. Pope, S. J. Sleh, and several others. Surveys were projected and work commenced four years ago. Cottonwood river has a summer depth of 18 inches, and in winter runs a torrent.

"A cut has been made through Dalzura Pass, 1000 feet long and 20 feet deep. Another important work is now being done, and within a year or so the great undertaking will be completed."

At the junction of Pine Valley and Cottonwood creeks a dam will be constructed 100 feet high and 450 feet on the crest. A reservoir covering 800 acres, and containing 6,000,000 gallons, is to be built. The cement used is obtained at Jamul at a comparatively trifling cost. From the dam a flume, 15 miles long, will extend to Jamul creek, terminating at Dalzura Pass, where an elevation of 1450 feet is reached. The flume will cost at the rate of \$10,000 a mile. At Dalzura the water will be diverted into ditches, and conveyed over three districts (including Otay and Linda Vista) of a total acreage of 95,000, with a reserve capacity of many thousands more. But the marvelous usefulness of the almost exhaustless system does not end here. At the west terminus of the Otay mesa the branching waters leap over a chasm of 300 feet, developing a horse-power of 1500, which may be used to operate factories or electric dynamo. The system in its totality also includes the supplying of San Diego with drinking water.

The total cost of the work will be \$1,000,000, and the recently formed district will vote bonds sufficient to cover this sum.

The "River Convention."

The California River Improvement Convention will be called together in Sacramento at 2 o'clock on Friday afternoon, the 15th inst. Through the action of this Convention of 1890, the Board of Engineers and the Engineer Department have recommended for the next fiscal year appropriations aggregating \$720,000 for the improvement of California rivers. The Convention will have to urge these appropriations before Congress and to see that no scaling down is done.

The following letter has been sent to the Boards of Supervisors of Shasta, Tehama, Colusa, Glenn, Butte, Sutter, Yuba, Yolo, Solano, Sacramento, Placer, San Joaquin, Contra Costa, Merced, Fresno, Stanislaus, Sonoma and San Francisco counties, and also to the Board of Trade, Chamber of Commerce and Produce Exchange of this city and to the Sacramento Board of Trade:

GENTLEMEN—I am directed by Hon. P. E. Platt, Chairman of the California River Improvement Convention, to request you to select and notify at least ten (10) delegates to this Convention, five (5) of these being in addition to the present members. These delegates are to meet in Sacramento, at 2 o'clock in the afternoon, on Friday, January 15, 1892.

It is unnecessary to more than call the attention of your honorable body to the need of appointing active and influential men, who will personally interest themselves in securing governmental aid in the vast work of improving, protecting and extending internal navigation.

This Convention will formulate and press measures to secure the appropriations recommended by the Board of Engineers appointed through the Convention of 1890. There has been recommended for California rivers the sum of \$720,000 for the next fiscal year. Every dollar of this sum should be appropriated. Very respectfully,

MARSDEN MANSON,
Secretary Executive Committee.

MARINE ENGINEERS.—The Marine Engineers' Association has elected the following officers to serve the ensuing term: Pres., F. A. Jones; Vice-Pres., Richard Tomlin; Treas., A. McDonald; Sec'y, S. True; Financial Sec'y, W. D. Nelson. Trustee—W. K. Martland, Chas. C. Lacey, Jas. S. Richards, F. Gough, Jas. E. Keller.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

CLINTON CONSOLIDATED.—*Leider*, Jan. 2: This mine was closed down for a day or two after the cold snap of last week, on account of the water in the ditch being frozen. The chlorination works came to a standstill Saturday, on account of the exhaustion of the stock of sulphurets. About 150 tons were treated. What they yielded we are unable to say. The percentage of silver is much heavier than is usually the case with the gold-bearing quartz of this county. We are told the sulphurets yielded over \$8 in silver to the ton. Some very rich ore is being extracted from the mine.

A **CLEANUP** was made at the Amador Queen mill Saturday, since which time the mill has been idle.

MARBLE.—The Carrara Marble Quarry Co. has levied Assessment No. 3 of two cents per share. It must not be inferred from this that the operations have not been remunerative. A certain amount of stock was subscribed to provide working capital to the extent of 15 cents per share. Even with the present assessment, only six cents of this sum has been called in. The stock thus subscribed for is supposed to bear all the running expenses of the company, until the full amount of 15 cents has been paid, leaving the proceeds of the sale of marble, as we understand it, untouched in the treasury, and available for dividends, or to meet the current expenses after the exhaustion of the 15 cents as above stated.

FROM SUTTER CREEK.—At the Belmont, two shifts are kept at work in the Boss shaft, which is now timbered and cleaned out down to the 70-foot level. The facilities are hardly sufficient to cope with the strong flow of water. They talk, however, of putting in machinery in the near future, which will enable them to handle all the water that is likely to be encountered. The vein is explored at this level the full width of the shaft and prospects well enough for milling purposes. The mill has been put in good repair, and will be started on ore in the early part of January. The Lincoln is still running along in the old way, and gradually improving. At the South Eureka the shaft is now down over 300 feet. The ground is somewhat harder, so that progress is slower.

FROM VOLCANO.—Cor. Amador *Dispatch*, Jan. 2: Work on the McLaughlin mine is progressing nicely under the skillful management of Supt. Beardsley. The Robinson boys are still working their mine with flattering prospects. The Kimball mine, on Pioneer creek, known as the Old Dead Sheep, is yielding some of the finest rock we have seen. The ledge is still widening, and the consequence is Mr. Kimball is jubilant. Jake Griesbach has also struck rich ore. Josh Goodrich, Superintendent of the Buckeye and old Volcano ditch, has men at work cleaning out the ditch.

Butte.

SIX THOUSAND MORE.—Oroville *Mercury*, Jan. 2: Yesterday E. B. Ward came down from the Pershaker or Rideout mine and brought 313 ounces of gold, the result of about 2½ days' cleanup. The first day they took out 216½ ounces, the second day, and the balance was picked up from waste places. In cleaning up, the miners literally scooped up the nuggets in handfuls. While the above is true, the mine was suddenly closed on Thursday, presumably for the purpose of making shafts and changing the method of working.

Calaveras.

PROSPECTING FOR GRAVEL.—*Calaveras Chronicle*, Jan. 2: George Edwards and Dan Danielson, two energetic, industrious young men, and practical miners, ton, have been at work for a short time, running an incline to strike and explore a branch of the "Blue Lead Channel," in Old Woman's Gulch, Danielson having purchased the one-third interest of John Williams in the location. It will not necessitate extensive operations to bottom the ground, as the indications already apprise the prospectors that they are upon the blue gravel deposit and about to penetrate it. They will continue their operations until satisfied of the extent and auriferous character of the deposit on their location. For a while a horse and whim will be used for drawing out the dirt.

SILVER ORE.—*Calaveras Citizen*, Jan. 2: Old Calaveras leads any other county in the State in the variety of its mineral products; while much attention has been given to gold, copper and other metals, it is right to let the heavy deposits of silver ore, situated north and west of Salt Spring valley and only about 7 or 8 miles from Milton, lie undeveloped. We were shown very rich specimens of silver ore by School Supt. Nunez this week. The rock was taken from the Reckley mine, which has lately been bonded by Cleveland & Donner.

El Dorado.

BLAIRS DISTRICT.—Cor. *Mountain Democrat* Jan. 2: Work on the machinery at the Blair mine has been progressing rapidly, and in the course of a week or so, the compressor will be ready for operation.

CHANGE OF MANAGEMENT.—*Mountain Democrat*, Jan. 2: Prof. Thos. Price, general manager, Richard Rowland, Supt., and Thos. Evans, general agent, have resigned the management of the Sierra Nevada Land, Water and Improvement Co. These gentlemen, upon retiring from the management of this grand property with its untold resources, which they have so ably conducted for several years, congratulate themselves upon the fact that it is now in better condition than ever before, and that it has been so far explored and developed, and with reasonable skill, energy and economy in its management, it can be made almost immediately available for the production of gold in large quantities and to great profit. The system of ditches belonging to the company are all in complete order, several new flumes having been constructed during the past year. The electric light plant, now supplying the city with light, is running regularly with water-power. The city water works, owned by the company, have also been put in complete order. At the Harmon mine, where a very skillful piece of engineering has been done by John Price, civil engineer, an upraise has been made and substantially timbered from the long tunnel below to the surface, through good ore, giving 560 feet of backs, now ready to be taken out and

run in the mill. At the Van Hooker a long tunnel has been run, and in a few days can be completed to a rich ore chute known to exist in that mine. The Epley mine has been so far developed as to show several thousand tons of ore available for immediate working. The Pacific shaft has been sunk to a depth of 1000 feet, showing a continuous gold-bearing vein from top to bottom. Arthur Young succeeds to the management of this property. Prof. Price is the owner of a one-fifth undivided interest in this large property, and hopes now that after so many years of toil and expenditure of money on making developments, he may begin to realize.

Inyo.

IMPROVEMENTS.—*Inyo Independent*, Jan. 2: Hon. P. Reddy is making extensive improvements at the Defiance and Independence mines. He recently paid Jack Wilson \$5000 for Wilson's interest in the Independence. In the latter mine there is a large amount of ore in sight, but owing to dust miners are unable to work long without getting sick. To obviate the trouble, water for sprinkling will be pumped from the Defiance dump to the Independence, a distance of three-fourths of a mile and a raise of about 450 feet. The necessary pumps, pipes, etc., are now on the ground.

Lake.

PINE FLAT DISTRICT.—*Santa Rosa Republican*, Dec. 29: There are immense lodges or ledges traversing the slate crop high above the surface or running through the mountain ridges. These continue into Lake county, and just beyond the line of Sonoma county a few miles we find such mines as the Great Western, Bradford and Napa Consolidated, all located on the belt of ledges found at Pine Flat. The prospecting done years ago, in the vicinity of Pine Flat, was of the most superficial character, and it was left to a later and more experienced class of miners to begin the development of a district destined to become famous as a quicksilver producer. There is at present considerable prospecting and development of the mines going on in the above mentioned district, and some permanent mines have undoubtedly been discovered. The Cinnabar King Mining Co. ran a tunnel into the ground 100 feet, passing through a body of ore 30 feet thick, and is now working day and night extending the tunnel toward the other two chutes which appear on the surface or near the surface. This company is also sinking to cut the air chutes lower down. This will give 500 feet of backing. There is an abundance of good ore in sight, and the outlook is a most favorable one. In the same locality, and on the same ore-bearing belt, is the Last Chance. The owners have a good body of ore. A shaft is being sunk. The American is another good mine in prospect. They have good hunches of ore, and very favorable indications when depth is reached. The Oakland, near by, has been a good paying mine, but has been idle for some years. The Excelsior mine is also making developments, which at the present writing are promising. Other smaller mines are being prospected or developed, and the general outlook is very promising.

Mono.

THE YEAR'S WORK.—*Bodie Chronicle-Union*, Jan. 2: The past year has witnessed more substantial prospecting in mining interests in Mono county than has been done for many years past, and with a success that promises a lively mining "boom" for the county next spring. In every district there are mines that promise to be bullion producers next summer. Among these are, notably, the Lakeview. This mine is in the Homer district, near Lundy, and about 20 miles from Bridgeport. A large body of gold ore has been disclosed, which is being worked in one of the small local mills. As it belongs to a close corporation of Maine men, the shipments of bullion are not given to the world, but it is sufficient to know that the mine has shown a value that has induced the owners, who are all shrewd business men, to erect a mill at the mine for the more expeditious working of the ores, which seem to be unlimited in quantity. The mill building is completed, and a large and substantial edifice it is, and everything is ready for the setting of the machinery, but which will not be put in until early in the spring, when a month or six week's work will place the mill—a ten-stamper—in fine working order. The tramway for transporting the ore from the mine to the mill is in fine working order, and as the mill will be run by water power, the cost of the working of the Lakeview ores will be very low, leaving a grand profit to the fortunate owners. There are many other valuable mines in the Homer district, and adjacent to the Lakeview, which are being steadily worked by their owners, who now and then ship a little bullion to the outside world, which enables them to work their mines and live well, and leave some over for a rainy day, knowing the time will come when capital will want their mines at a fair valuation.

BODIE.—The working the Bodie mines goes steadily on, the old reliable Standard Co. making its regular monthly shipments of bullion. The "unpleasantness" so long existing between the Bulwer Con. and Standard Con., and which was a detriment to both corporations and the district, has been settled, and the Bulwer will soon have a mill running on the rich ore so long in dispute. The Standard has declared a dividend of 10 cents a share.

BENTON.—The mines about Benton are being worked quietly and profitably, most of the ore being shipped to the Selby works at Vallejo Junction for reduction, at a freightage of about \$3 a ton.

GREEN CREEK.—This district, contiguous to Bridgeport, will make a good name for itself next summer. The Ward & Ryan claim has been opened sufficiently to warrant the erection of an arrastre, or small mill, the rock showing free gold, of which there seems to be an abundance. Other claims, which are looking well, will be prospected vigorously next summer.

PATTERSON DISTRICT.—More substantial, intelligent mining has been done in this district this year than for some years back. There are several claims that will be worthy the attention of capitalists next summer. Among the promising are the Home-stake, Kentucky, Lookout, Monte Cristo, the Murphy claim, and Rattler, upon which the most work has been done. It takes money to open a mine to a paying proposition, and that is the only item lacking in making the Patterson district, Mono county, a grand bullion producer. The prospects of the county, from its extreme northern boundary to its southern, for even Antelope valley on the north

has pretensions to having good mining prospects, were never so flattering as at this time, and our people confidently look for the coming year to be a busy and prosperous one for Mono county.

Nevada.

TO BE INCORPORATED.—*Grass Valley Telegraph*, Dec. 29: Steps will be immediately taken to incorporate the Cottontail mine, located in the vicinity of Rough and Ready. The principal owners are Oscar Patterson, Jas. Stead, Josiah Andrews and John Williams of Grass Valley, and Wm. Torpie of Rough and Ready. Several weeks since some rich specimen ore was taken from the Cotton-tail at a comparatively superficial depth.

Plumas.

IN INDIAN VALLEY.—Cor. *Plumas Bulletin*, Dec. 30: The outlook in Indian Valley district has never been better than at present. The Drury-Pacific mine, owned by Messrs. McGill & Standart, situated in North canyon and near Round Valley reservoir, since May last has added over \$23,000 to the world's wealth, representing the proceeds of 3000 tons of ore milled. Extensive development work, including air drifts, raises, etc., prevented milling till late in the season. The mine now shows reserves above the present working level sufficient to provide three years' crushing for their fine 20-stamp mill located on the property.

JOHNNY BULL.—Deep in the depths of North canyon and below the Drury, this mine is situated. The owners have equipped a five-stamp mill from its proceeds, and have been running for most of the season on profitable ore.

ACADIA.—A large amount of money was taken out of the upper workings some years ago. A new tunnel has recently been started to tap the vein lower down. The 10-stamp water mill upon this mine is the property of D. McIntyre and is frequently employed in crushing custom ore.

PLUMAS CONSOLIDATED M. & M. Co.—Disagreements with the water company over rates for water caused the owners of this mine to close down its machinery two years ago. Several men have since been kept at development work and they are known to have revealed rich ore in abundance.

CRESCENT MINE.—For eight months past the work of sinking to obtain an additional 200 foot level of this mine, has been in progress. The shaft was recently completed, and the work of running both the north and south drifts for the purpose of tapping the vein, is now under way. Additional and permanent pumps have been placed in position in the mine.

GREEN MOUNTAIN.—The plant consists of one of the finest and most expensive 60 stamp mills in the State, together with air compressor, drills, &c., and all modern appliances for mining and handling ore economically. Power is obtained from water supplied to Pelton wheels by the Round Valley Water Co., under pressure of 500 feet vertical fall. The adjoining claims, embracing what was formerly called the Cherokee mine, are now consolidated with the original Green Mountain property, forming a chain of continuous locations, many thousand feet in length. The main tunnel will be driven ahead to connect the two properties. This tunnel is now nearly 600 feet into the mountain, over 1000 feet below the surface croppings. By an extensive system of cross-cutting to be employed, the numerous parallel veins known to exist but never heretofore sought for by this method, will be thoroughly prospected.

BUTTERFLY MINE.—*Plumas National*, Jan. 2: S. S. Williams informs us that the owners of the Butterfly quartz mine are now working in the shaft, which is down 50 feet and ore was taken out of the bottom this week that was very rich. This will undoubtedly prove a very good mine, when once developed. It is owned by Thompson, Kellogg & Smith.

SWAN.—Hubbard & Waldren, who are working the Swan ledge at Granite Basin, are taking out some rich ore. The east tunnel is now in 250 feet, and the west end 200 feet, leaving about 400 feet to connect the two tunnels. A five-stamp mill is now on this property, but Mr. Hubbard tells us in the spring he will try the McArthur and Forest process, and if it proves a success, a large plant will be put up.

SALE.—Pat Maloy has made a sale of his mining property on Willow Creek, some three miles from Buck's Ranch, to a Virginia City company. A 10-stamp mill will be put up in the spring. The rock is very rich, prospecting \$65 to the ton. Ed. Fields is running a tunnel south of town for a rich channel. He has great faith that he will strike it, for he says he knows the gold is there. The Golden Gate Co. have about finished cleaning out the old tunnel run by Barrett & Co. a few years ago. They will extend this tunnel, and expect to strike the ledge in running a hundred feet or so.

Shasta.

TELLURIUM.—*Redding Free Press*, Jan. 2: At the annual meeting of the Eureka Tellurium M. Co., the following directors and officers were elected: Directors—Peter Scherer, Isaac Atwood, F. B. Simonds, E. A. Zoellin and Philip Scherer. Peter Scherer was elected president, Isaac Atwood vice-president, George C. Jones secretary, and the Bank of Shasta County treasurer; Peter Scherer general manager.

Sonoma.

GREAT EASTERN.—Cor. *Santa Rosa Republican*, Dec. 29: The Great Eastern mine near Guerneville, which has been worked the past 16 years, has about 100 men employed, and with the aid of three ten-ton furnaces, 150 flasks of quicksilver are produced monthly.

San Bernardino.

CEMENT.—*Redlands Facts*, Jan. 1: The contracts between the Los Angeles Portland Cement Co. and the Pacific Improvement Co. have been signed, and by June 1, 1892, a plant costing \$50,000 will be erected on Slover mountain. The company will make 100 barrels of cement per day for 18 months and 300 barrels a day for the balance of five years. When running to full capacity, the works will give employment to 400 men. The company has a capital stock of \$500,000.

NEVADA.

Highland District.

GEORGIA.—*Pioche Record*, Jan. 2: Henry Welland and J. H. Empey have struck a body of ore in the Georgia mine at Highland, this week, which will undoubtedly prove an important find. A tun-

nel has been run into the hill about 30 feet on a small streak of ore. In driving this, the miners encountered a cave or fissure filled with ore and of great extent. One of the men crawled into the fissure 15 or 20 feet and obtained samples of the ore, which is very easy to extract, and goes 39.33 ounces silver and 60 per cent lead. As this find is developed, we will have more to say concerning it.

Jackrabbit District.

ORE BODIES.—*Pioche Record*, Jan. 2: Three new bodies of ore have been discovered in the Day mine within the last few days. The location of the principal find is about 70 feet south of the shaft and 20 feet above the tunnel level. The ore assays from 40 to 200 ounces silver per ton, and Mr. Hazlegrove says that the whole body, so far as prospected, will go over 40 ounces. The extent of this ore body cannot yet be ascertained, but enough has been done to prove that it is very large. The other finds are smaller, but are of a good grade of ore, and will probably yield several thousand dollars before they are exhausted.

Tuscarora District.

NORTH BELLE ISLE.—*Times-Review*, Jan. 2: No. 3 north drift, 400 level, extended 5 feet. No. 4 north drift, 500-foot level, extended 13 feet, again cutting the vein. Crosscut from No. 2 raise, north end, extended 7 feet, passing through several stringers of good ore. The winze below intermediate crosscut sunk 7 feet, exposing a strong vein with very rich ore. There is no doubt but that this vein is the No. 1 vein of the Belle Isle that has yielded so largely in the past. The stopes are yielding as usual and employing about 10 men.

NAVajo.—North intermediate drift below 350-foot extended 4 feet, yielding some good ore. No. 2 winze below 350-foot level sunk 4 feet on a small vein of very rich ore. The stopes are yielding as usual, but we have been unable to ship any ore, owing to continuous snowstorms.

BELLE ISLE.—Have started an intermediate drift north from the winze below the 350-foot level, No. 2 vein, and the face is showing very fine ore. Stopes on Nos. 2 and 3 veins are producing as usual.

DEL MONTE.—2d level—Joint drift has been advanced to feet, exposing ore along the line 45 feet. Have started to open stopes on this ore.

NORTH COMMONWEALTH.—Second level—Stopes north from the winze do not look so well as last reported. On the south and east of winze still showing very high-grade ore. Have started winze from west drift to follow the ore down; extracted 66 cars of ore.

COMMONWEALTH.—Fourth level—South drift from No. 2 raise has been advanced 8 feet in the line, and joint raise started; should reach the vein in about 25 feet.

NEVADA QUEEN.—Second level—No. 1 south drift has been advanced 15 feet. No. 2 south drift has small seam of ore in the bottom, giving assays \$234 per ton. Fourth level—West crosscut following the vein has been extended 14 feet, with spar showing iron pyrites in the seams. A joint raise has been started on the line to cut the vein.

Washoe District.

CON. CALIFORNIA & VIRGINIA.—*Virginia Enterprise*, Jan. 2: 1100 level—From the end of the drift run south from the main north lateral drift, an east crosscut has been advanced 30 feet in a quartz formation carrying low assay value. Have extracted a few tons of milling ore from between the east crosscuts Nos. 4 and 5. 1500 level—The incline upraise has been carried up 25 feet; total, 80 feet; following the ore streak, which has narrowed and become of poor quality, and has been stopped. 1600 level—The various openings on this level continue to yield some ore. 1650 level—Have continued to extract ore of fair quality from the drift run west from the top of the upraise carried up 59 feet above the south-west drift. 1750 level—In working out and upward from the bottom of winze No. 2, sunk from the 1650 level, we continue to extract ore of fair quality. Have also extracted some milling ore at the point where the upraise carried up from the crosscut run west from the southwest drift made connection with the stopes on the eighth floor. There has been extracted from all parts of the mine during the week 1029 1350-2000 tons of ore, which was shipped to the Morgan plant. The average assay value of all the ore worked at that mill during the week (980 tons) was \$22.36 per ton. Bullion shipped to Carson mint, assay value, \$27,770.02. Bullion shipped to the office in San Francisco, assay value, \$1960.01.

OPHIR.—1465 level—Have continued our prospecting work in the openings leading from the point where the upraise from the sill floor of this level connected with the drift run west from the winze 122 feet below the sill floor of the 1300 level, and have extracted some ore, which has not yet been raised to the surface.

MEXICAN.—On the 1465 level the winze started at the end of the crosscut run west from the north lateral drift at a point near the south boundary line of the mine, 132 feet in, has been sunk 6 feet; total depth, 101 feet. From the bottom of this winze a west crosscut has been started.

UNION CON.—On the 900 level the joint Sierra Nevada and Union Con. west drift from the shaft has been extended during the week 31 feet; total distance west of the shaft, 1595 feet; the last 20 feet has been in vein matter yielding low assays.

UTAH.—750 level—At a point 50 feet south from the winze station, west crosscut No. 1 has been advanced 37 feet; total length, 172 feet, continuing in porphyry formation, showing some clay and a little water.

GOULD & CURRY.—North drift, 65 feet above 200 level, is advanced 165 feet. From the end of this drift started west crosscut No. 3, and advanced same 10 feet through quartz.

OCCIDENTAL.—The upraise from west crosscut from the south drift has made connection with the south drift on the 300 level. The winze from north drift, 350 level, is now down 53 feet below the 400 level, and continues in fine grade ore.

BEST & BELCHER.—900 level—At a point 100 feet above 1000 level, in upraise No. 1, started a northwest drift, and advanced same 20 feet through hard porphyry and stringers of quartz.

CHOLLAR.—Have resumed work in the north drift from the incline station, 1500 level; the face is in hard porphyry. Extracted and sent to the mill in the past week 368 tons of ore; average battery assays, \$38.91.

POTOSI.—The south drift from top of raise, 1200 level, is out 41 feet; face in quartz yielding fair assays. The east crosscut from the winze station, 1400

level, is out 56 feet; face in porphyry. Have connected the south drift from Chollar incline with north drift from Potosi winze on 1500 level.

EXCISEQUER.—East crosscut, 150 feet north of north line, 600 level, is out 200 feet; face in porphyry.

SIERRA NEVADA.—West crosscut No. 1 from the northwest drift, 630 level, 571 feet from the shaft, has been advanced 37 feet; total distance, 1535 feet; face in porphyry.

ALPHA.—The east crosscut south of the winze, 550 level, is out 39 feet; face in quartz and porphyry yielding low assays. The north drift from the winze 80 feet north of the shaft, 500 level, is out 129 feet; face in clay and quartz.

WARD COMBINATION SHAFT.—The southwest drift, 1800 level, is out from shaft 907 feet, the last 10 feet in clay and quartz.

SILVER HILL.—During the week shut down the Silver Hill shaft and are preparing to work the mine from the Justice shaft.

NEW YORK.—West crosscut No. 4, 650 level, is out 58 feet; formation quartz. The east crosscut, 740 feet north of the shaft, 1100 level, is out 58 feet; face in quartz and porphyry.

ARIZONA.

MOHAVE CO. NOTES.—*Miner*, Jan. 2: It is reported that both of the mining companies that have been operating in Weaver and Minnesota districts have suspended. No reason is assigned, but it is presumed to be on account of the failure of the water power wheels to run the quartz mills. Every one who has visited the districts pronounce the supply of ore practically inexhaustible, and as there has been no millrun made, the suspension cannot be attributed to the grade or baseness of the ore. The hoisting works on the Distaff mine at Chloride was burned to the ground Wednesday night. The building was a total loss, but fortunately the machinery is but slightly injured. Operations on the mine and mill at Gold Basin have again suspended. This time it is alleged that the shutdown is caused by the freezing of the water in the pipe line, which had the effect of bursting the pipes in a number of places. Of course, this shut off the supply of water for the mill, but it is a to-be-regretted fact that it was deemed necessary to close down the mine, pending the repairing of the pipes.

COCHISE DISTRICT.—*Tomestone Epitaph*, Jan. 2: Three carloads of ore were shipped from Dragon station on Tuesday last to Pinos Altos mill. The ore was from the Golden Rule mine, which is coming rapidly to the front as one of Cochise county's big producers. From Jimmy Barrett, who came in from there on Thursday, the *Prospector* learns that the storage reservoir, which is to hold water for the mill to be erected, has been completed. The size of a lake, when full, will be one mile long, 70 feet wide and an average of 30 feet deep. The dam is one mile below the mine. This will be one of the first attempts at water storage chronicled in Cochise county. Mr. Bell, who is the owner of the mine, looks upon the work as experimental, but hopes for the best, and if the reservoir holds the water, he will place one of his largest mills, of which he has several, on the property. The extension of the mine belongs to Barrett. He has leased one divided half of it to Thomas Trainor, who will begin work at once. Besides the gold ore, which is considered the most valuable, this district also contains some first-class smelting ores, that are being looked after by smelting men. Taken all together, the outlook for this district is a most auspicious one.

BRITISH COLUMBIA.

MACHINERY TO BE PLACED ON THE DANDY.—*Nelson Miner*, Dec. 29: Enough is now known of the size and character of the ledge on the Dandy to warrant its owners placing machinery on the property. With that end in view, the working force has been reduced, Superintendent Ray leaving Nelson for Wardner, Idaho, yesterday. It is understood that an electric plant will be put in early in the spring, as electric machinery is now in successful operation in the Poorman and Black Bear, two well-known Cœur d'Alene mines. Manager Esler is to be congratulated on adding another mine to the list of those successfully operated by his backers. Since beginning operations at the Dandy in May last, Superintendent Ray has run nearly 500 feet of tunnels and drifts—pretty good work for the number of men employed. William Springer, the well-known miner, is now in charge of operations at the mine.

TUNNEL ON THE EVENING.—The tunnel on the Evening is in 160 feet, with two men at work on a contract. The contractors expect to receive word from the owners of the property (Spokane parties) to crosscut the ledge, the tunnel being run on the hanging wall. The snow is reported less than three feet deep at the mine, which is distant about three miles westerly from the Silver King.

COLORADO.

SMELTING ORE.—*Mining Gazette*, Jan. 2: The Hubert company is sinking a winze and making an upraise to connect the 850 and 900 foot west levels, and are employing a force of 25 miners. The smelting ore nets from \$90 to \$180 per ton. The stamp mill dirt yields from four to ten ounces of gold per cord.

STRIKE.—A strike of considerable importance has been made on the Mary Ann lode, on the western slope of Argentine pass, during the past week. The property is owned by J. P. Ward. During the past few months he has had a crosscut driven to the lode and recently let a contract to run a drift. A little mineral was showing at the start, and during the past week it has opened into a solid vein of high-grade ore.

THE LITTLE ALBERT resumed work this week. The company's secretary, J. E. Lawton, has been in the city the past week and has paid up all accounts against the company. Lou Harvey, the old superintendent, has been reengaged and has hired a force of men and put them to work. This mine has a good reputation in this district as a profitable producer from the day of its discovery, and everyone will be pleased to hear that the company has decided to resume operations.

PROSPECTING WITH A DRILL.—*Pitkin Miner*, Dec. 29: The Diamond drill now being placed in Chicago park by the Pitkin Mining Co., is destined to revolutionize the past mode of prospecting for mineral in the Lime belt contiguous to Pitkin. This

drill is a Sullivan Diamond Core drill, with a capacity of boring 2000 feet and taking out a perfect core of the formation to that depth, of 1 3/4 inches in diameter. The machinery consists of a 25-horse power boiler and double cylinder engine with double duplex pumps, also drills, drill rods, casing and a complete outfit of the latest improved pattern. The Pitkin Mining Co.'s property consists of 22 lode claims, comprising nearly 230 acres, mostly in and around Chicago park in the center of the mineral belt, forming a basin which is surrounded by the best shipping mines in the district. The formation is lime and porphyry, which pitches or dips toward this basin. The Pitkin Mining Co. is a local organization. Mr. W. L. Youle is the efficient superintendent in charge. The drill is now being placed over the Ferry shaft at the lower end of the park. This shaft is already sunk to a depth of 100 feet, having passed through the overlying porphyry and encountered the lime. It is estimated that it will not take to exceed 400 feet farther to prove up the contact in the lime at this point. The conservative miners of the camp all concede without a doubt that this drill will prove up immense ore bodies in Chicago park.

DAKOTA.

GALENA.—*Deadwood Pioneer*, Jan. 5: At this camp there are at present only four mines being worked, the Bullion, Cora, Hayes and Silver Queen. The Bullion is producing some good grade ore, averaging about 50 ounces in silver. Lead carbonates are found in large bodies in the Hayes and Silver Queen. The former is shipping to the D. & D. smelter in this city, while the latter is stacking its ore on the dump, awaiting increased facilities for shipping.

ANNIE AND OPHIR.—*Deadwood Pioneer*, Jan. 2: A description of one gives a good idea of the other of these claims. They are both evidently on the same contact. A rim or fringe of ore was found in the hillside, starting in a seam about five feet thick, which carries free gold of a low grade. As depth was attained in the workings, the dip was found to be sharper, and the mass of ore larger and of better quality. Some small quantities of very good ore found from the start deceived the first owners as to the average. Experimental mill tests were made, and the average found too low for profit, though it was high enough to be very profitable, had there been been very large quantities of it, so as to warrant a very large mill. Upon the Annie, very extensive workings have been opened, by a main tunnel several hundred feet long, in which heavy masses of ore have at last been struck, with indications that they are extensive. Tests indicate that it will average \$4 per ton. In this mine and other deep works in that vicinity, are exposed what seem immense bodies of what some miners call pudding stone, which is valuable as a free gold ore in proportion to the amount of iron in it. The mass seems to be a mixture of all the different rocks of the vicinity, churned into one mass, and great hopes are still entertained of finding the mother lode whence came the valuable mineral. The Annie mine is the largest mass so far opened.

IDAHO.

A GENERAL SHUT-DOWN.—*Butte Inter-Mountain*, Dec. 23:—News has reached the city that the Poorman mine, in the Cœur d'Alene, has closed down for the winter, and that about 60 miners have purchased tickets for Butte. The news of the shutdown is not surprising, and it is very likely that all the mines in Canyon and Prichard creeks will suspend operations. This is the result of a determination made a year ago. At the Poorman mine, the company has not made any money during the months of January and February since it has been in operation, and sometimes in the month of March. Instead, during these months, the expense of running has increased and the mine gutted out; added to this were the annoying delays of freight on the railroad caused by snow blockades, and on top of all this is high freight rates. The Cœur d'Alene companies want a reduction of \$2 per ton on the freight rate. If this were granted, they could continue mining at a small profit during the winter, but it has not been granted, and the result is the railroad company is likely to be deprived of any business in that section for the next two or three months. Several months ago, the different companies agreed to close down unless the reduction was made, but it will probably be only for the months of January and February.

MONTANA.

BARKER.—*Helena Mining Journal*, Dec. 30: After thoroughly testing the ore of the Carter at various smelters through the country the owners of the mine have decided that they can save money by concentrating their ore at the mine. They have accordingly ordered machinery for a plant capable of treating 50 tons daily. They have also ordered a hoisting plant and will sink the double compartment shaft 300 feet. This will give them sufficient ore for several years. It is learned that Senator T. C. Power intends putting up a concentrator at the Wright & Edwards.

BELT MOUNTAIN MINES.—A visit to the old Wright & Edwards mine discloses the fact that since operations were resumed rapid progress has been made. The shaft house will also be used for the hoist. On the lower side are substantial ore bins, having a capacity of 200 tons. These bins are arranged so that the ore may be dumped directly into the wagons. The machinery consists of a 40-horse Griffith engine and two 30-horse boilers. Development on the mine consists of a shaft down 180 feet and a tunnel in 676 feet. This work was done early in the 80's when Barker was the liveliest camp in the West. The shaft was sunk on ore all the way and there is now exposed in the bottom a vein of solid galena six feet wide. The tunnel was driven through ore and lead matter and there is still much good stopping ground. Mr. Cowan, superintendent of the mine, has cleaned out the old workings, repaired the timbers, and is now ready to commence taking out ore. Common report has it that the Wright & Edwards are the two best properties so far known in the Barker district. Their developments promise much for the future prosperity of Barker.

ANACONDA.—*Butte Inter-Mountain*, Jan. 2: It is understood that the Anaconda Company has sent

a force of men out to work at Three Forks, for the purpose of making ditches with a view to creating a big water power there. Whether this is the preliminary step toward the building of the much talked of refinery or not is not known, but it is so considered. At the smelting works at Anaconda, the capacity of the electrolytic refinery plant is being doubled.

WITH A DIAMOND DRILL.—*Phillipsburg Mail*, Jan. 2: The stride in the Jubilee tunnel, which was reported in the *Mail* two weeks ago, has assumed greater magnitude than any one connected with the mine had anticipated. The strike was made at a distance of nearly 1300 feet in the tunnel, and at a perpendicular depth of about 200 feet. There is now 14 feet of rich ore in sight, and the footwall is not yet encountered. Large quantities of the ore is being taken out and hauled to the mill, which, it is said, will start up about the middle of January. From every appearance of the find in the Jubilee, it bids fair to outlive any previous discovery in the Hope company's ground, they are pretty sure to enjoy another season of great prosperity. Of the mines of the Hope hill, none are regular fissure veins, but a series of pockets of ore in limestone have been discovered one after another, and the history of the Hope company shows that about the time the public begin to think they are nearing the end, they have always uncovered a body that assured them new life. The occurrence of faults in the Hope hill mines have heretofore made the explorations of ore bodies very expensive, but of late the company has perfected its system of prospecting by the introduction of the diamond drill, by which means the hidden deposits have been located to a high degree of mathematical precision, and the present body in the Jubilee was encountered by such means many months ago.

NEW MEXICO.

BULLION.—*Southwest Sentinel*, Dec. 30: The Last Chance Mining Co. shipped 105 1/2 pounds of bullion on the 18th inst. worth \$2160.46 and on the 26th inst., 94 pounds, worth \$1946.58. This company milled 660 tons of ore in November and shipped \$5302.32 in bullion, a trifle over \$8 per ton. Steady running is the only need of this mine to bring it to the front as a dividend payer.

TRES HERMANAS.—Mr. James Martin, the lessee of the Contention mine, the property of Judge Bail and others, has rescued it from comparative failure, and by competent mining judgment and push made it a fair producer and placed it on a paying basis. The mine is in limestone, and is situated on a low lying foothill abutting on the plains. The ore consists of cube galena and lead carbonates, and by rough sorting runs 45 per cent lead and from \$13 to \$18 in silver. The last four carloads of ore were consigned to the Pueblo Sampling Works, sold in the open market, and being a desirable product for the smelters, realized its full value and the returns were satisfactory. Three teams are constantly employed hauling ore to the railroad depot at Deming, 22 miles distant, the freight being \$4 per ton. Mr. Taylor is taking out a good grade of ore from the Hancock. He is driving a level from the bottom of a 95-foot shaft to tap another shaft sunk farther up the hill, at a depth of 125 feet. The surface ground yielded quantities of extremely rich horn silver ore, and there is no reason why it should not descend to a much greater depth than has yet been attained. The Cincinnati, the old stand-by of the camp, is worked by a few leasers in a desultory manner. It has produced some \$60,000 worth of the precious metals. Mr. John I. Heatley has held on to a group of mines lying south of the Contention for ten years, and during that period has made many shipments that netted fair returns. Mr. Brockman shipped three tons of ore from the extension of the Cincinnati that was carefully sorted and ran high. Mr. Stewart and a few other leasers on another extension have made small shipments and are making good wages. The entire absence of water in the camp, for either drinking or culinary purposes, is a great drawback, as the nearest well is from three to five miles from the various mines.

BLACK HAWK.—*Silver City Enterprise*, Jan. 2: The Black Hawk mine will probably be worked before many months have passed. This mine produces larger quantities of native silver and argentine ore than any other mine in the world, and would have paid handsomely, only it was systematically robbed. Under competent and careful management, there is no doubt but it is a dividend payer. Wages and supplies cost less than when the mine was worked before, and if all the ore taken out be placed to the company's account, it will be a bonanza for the owners.

CENTRAL.—The new strike at Central extends through two claims. The original location, the Grand Central Silver, owned by Bennett and Potter, has sacked several tons of ore running away up into the hundreds. The owners have had many obstacles to contend with, and have only sunk their shaft to a depth of 12 feet, but hereafter sinking will progress more rapidly and shipments will be large. The Texas mine, the north extension of the Grand Central, is owned by Ross, Holliman and Corn, and has a shaft 18 feet deep. Considerable high-grade ore has been extracted. The lowest grade of ore yet taken from the mine ran 118 ounces in silver; the better grade ran 325 ounces in silver and \$20 in gold to the ton. The vein is 18 inches in width and all ore of the above grade. For the three months, October, November and December, since the Last Chance mill at Sutter Creek started, there has been milled about 2000 tons of ore, which has produced \$16,000 in bullion. In the neighborhood of \$7000 has been produced and shipped during the past 15 days. Heretofore the mill has been handicapped by lack of wood supply and the freezing up of the water. The unprecedented cold snap of the past month has been a severe drawback, but as soon as rough weather ceases, everything is in excellent shape for a continuous run. When the mill is running steadily, it will crush 1500 tons per month, and the returns will be at least \$12,000, leaving a handsome net profit.

OREGON.

TIMBER CANYON MINES.—*Bedrock Democrat*, Dec. 28: The Democrat received a call yesterday from a gentleman interested in the mines of Timber Canyon, a new district situated about 12 miles due east of the White Swan mine, in the Virtue mining district, and we learn that considerable development work is in progress in that locality. Among the

most prominent mines of the Timber Canyon district are the Hay Digger and Davy Crockett, owned by Fuller and Holcomb. Two hundred and fifty feet of tunnel work has already been completed on the Hay Digger, and the ore on the dump assays \$120 to the ton free gold. Another tunnel has been started, and is now under headway to run on the ledge, which will average about four feet in width, and the work is being prosecuted by a force of five men. Work will continue all winter, and it is expected that enough ore will be on the dump by spring to justify the erection of a Tremaine mill, which the owners are now negotiating the purchase. Altogether, there are 14 different locations in the district, and those that have had development work done on them indicate that they are good properties.

ANOTHER OUTPUT.—Wm. Mulkey, one of the owners of the White Swan mine, arrived in the city yesterday with a kettleful of the yellow metal, and deposited it at the Baker City National bank. It was learned that the shipment amounted to \$2200, making the total output of the mine, which has been in operation something over two months, \$38,000. The *Democrat* is informed that the property continues to show up first-class, and in fact, better than ever. It has only been four days since a similar amount was brought to this city, the usual amount of time elapsing between shipments. Another battery was placed in operation Saturday, which will enable the mill to work 12 tons of ore every 24 hours, thus doubling the output.

UTAH.

VALUABLE GROUND.—*Park Record*, Jan. 2: The Bald Eagle group of claims, owned by Mike Qualey and Peter Shanley, and covering the eastern extension of the Ontario vein, is beginning to attract a great deal of attention, and several parties have recently been making inquiries concerning it. This property adjoins the Ontario ground on the east, and is composed of six patented and one unpatented claim, and is acknowledged by almost everybody to be one of the Park's future big mines. It will be crossed by the big Ontario drain tunnel, which will make it a dry mine and greatly reduce the expense of its development. The company that takes hold of the group and sinks a good shaft from 400 to 800 feet deep will find, beyond the question of a doubt, that it is a property just as valuable as the famous Ontario.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

DEWEY PUBLISHING CO., Dec. 29. Object, to publish the RURAL PRESS and MINING AND SCIENTIFIC PRESS. Capital stock, \$75,000. Directors—Alfred T. Dewey, S. H. Dewey, Warren B. Ewer, Alfred Holman and Frank P. McLennan.

FISHING AND CANNING COS., Dec. 29. Nine companies have been organized to establish as many fishing stations and canneries at the following named places in Alaska: Uyak, Nakneck, Little River, Uganuck, South Olga, North Olga, Afognak River, Fort Alexander and Karluk Spit. The directors are the same in each incorporation and are Henry Plageman, Henry F. Fortman, S. B. Peterson, August J. Gerdon and Frederick E. Siebe. The capital stock is \$10,000 in each incorporation.

SAN LUIS M. CO., Dec. 29. Capital stock, \$500,000. Directors—Lloyd Tevis, Joseph Clark, I. C. Stump, W. H. Hearst and W. S. Tevis.

INYO AND KERN CANAL CO., Jan. 5. Object, to conduct water along Owens River valley and Ross Springs valley, into Indian Wells valley, etc. Capital stock, \$1,000,000. Directors—Andrew J. Robinson, Frank H. Austin, G. P. Rixford, J. W. Wesson and H. Ottersen.

GEOGRAPHICAL SOCIETY OF THE PACIFIC, Jan. 5. Object, encouraging and promoting geographical explorations and discoveries, etc. Directors—George Davidson, T. E. Slevin, Henry Durhrow, John Partridge, Louis L. Nelson, A. S. Lowndes and C. Mitchell Grant. The corporation, not being organized for pecuniary profit, has no capital stock.

SAN FRANCISCO AND FRESNO LAND CO., Jan. 6: Capital stock, \$600,000. Directors—H. M. Fortescue, J. P. Martin, Henry Pichoir, J. H. Dohinson and C. L. McCoy.

CHOPE COMBINED ROLLER-SCREEN AND SHADE CO., Jan. 6: Capital stock \$50,000. Directors: T. Chope, A. J. Wilkinson, M. Stern, F. W. Theisen, W. J. Wallis, W. A. Cross and J. W. Shanahan.

PETROLEUM AS FUEL.—The use of aerated ornde petroleum as fuel in place of coal is rapidly extending, and very many of the largest concerns in this country, whose work requires the employment of an intense heat, have adopted this system. The chief lines of work for which it has been introduced are iron and steel forging, tempering, welding, annealing, etc., in glass works, for furnaces, ovens, generating steam, burning lime, burning sewer pipe, heating asphalt, tinning and japanning, oxidizing lead, heating retorts in gas works, etc. An efficient and economical air compressor is a most important factor in the successful operation of these plants, and after a careful examination of the various types of these machines now on the market, the majority of the licensees who were intrusted with the introduction of this new fuel in their several districts, decided to adopt a special design submitted by the Clayton Air Compressor Works of 43 Day street, New York, thus scoring another triumph to the already long list achieved by the makers of these machines. They are now in use in over two-thirds of the oil-burning fuel plants in the country, everywhere performing their duty in a manner to merit the highest praise.

FROST has a variety of effects upon different products. Under the same influence, eggs will burst, apples will contract and potatoes will turn black.

MECHANICAL PROGRESS.

An Interesting Experiment With Steel.

We clip the following from the American *Machinist*, to which journal it was communicated by Charles Wetterer of New York:—It appears that the idea that steel is a chemical combination of iron and carbon is universal; but where is the proof? When two elements combine chemically the nature of both changes; this does not happen when iron is carbonized, but a change does take place; the pulverulent carbon melts. Well, it will be said carbon has never been melted. Be pleased to hear my explanation. The atoms of carbon buried in molten iron are in a very different position, for instance, from that of electric light carbons; it does appear that the fact that the iron is molten has a greater effect on the carbon than the temperature itself. To this action we have a parallel in ordinary illuminating gas, concerning which a prominent work on chemistry says: "The light and gaseous hydrogen possesses in a great degree the power of rendering other bodies aeriform, on uniting with them, even those which are not volatile, just as an eloquent speaker can communicate his enthusiasm to an indifferent audience."

To prove this idea I have succeeded in crystallizing carbon taken from steel wire nails, iron cut nails, and steel filings, by dissolving them in acids. It is, however, a difficult thing to do, the chief obstacle being that about 98 per cent of iron must be dissolved in order to obtain about 2 per cent of carbon. If the dissolution of the iron is violent, the gases generated carry the nascent carbon to the surface, where it is oxidized by the oxygen in the air, causing small explosions that are easily perceived in sunlight; to this nascent state of the carbon its power to crystallize is due. If the action is less violent, or the carbon artificially obstructed, that which is so obtained resembles lamp-black; sometimes a body of the same consistency is formed, but it is white.

My first experiment was to dissolve a small quantity of steel filings in about a teaspoonful of acid, which resulted in a few small crystals, but, nevertheless, larger than the grains of steel; by pressing these crystals into my thumb nail and drawing them across glass, they cut or scratched, as only diamonds can. The result of the past six months of experimenting is small, but efficient, I think, to establish my theory.

It may be mentioned here, in support of this argument, that diamonds on being placed in the electric arc, melt, oxidize and disappear like a flash; carbon in steel, on being burnt, behaves in the same manner, which would indicate not alone the separate existence of carbon, but that it is molten.

It appears to me as reasonable that when steel is heated, the atoms of carbon have a tendency to unite, and form comparatively large particles; when slowly cooled, these particles remain large, but on being chilled the molten particles are shattered to atoms; in this way the surface area of diamond presented to iron may easily be increased from 10 to 100 times. With this increased surface contact, and the more thorough diffusion, it is not difficult to understand why steel should harden on being chilled. It is also possible that the different conductivity of carbon and iron, and electric currents set up in the chilling metal, have their influence on the arrangement of the atoms, and possibly, on the degree of hardness or tenacity; by drawing temper the atomic diamonds begin to gather and rearrange slowly, until the proper degree of hardness or size and arrangement of diamond particles is shown by the color, when further progress is arrested by quenching.

Fast Railroad Trains.

London *Engineer*, in commenting on the performance of the fast train on the New York Central road, says: Taking the American run as a whole, it constitutes a distinct departure in railway work. Not the least remarkable feature about it is that it shows that it is possible to attain very high speeds with comparatively small coupled wheels. It by no means follows, however, that it is advisable to retain them for very fast trains. On the other hand, we believe that very high wheels are equally out of place if very long runs are to be made, because on snob runs it is certain that more or less steep inclines will have to be surmounted. If the average speed of a train is to be about 50 to 55 miles an hour, then banks may be ascended at 40 miles an hour, or even less, and descended at 60 to 65 miles an hour.

But when an average speed of 60 miles an hour must be made, we cannot rely on descents to compensate for ascents, because enormous velocities would be required, and the cost and wear and tear would be out of all proportion to the advantage gained. The engine must, therefore, be competent to maintain a high speed when running uphill, and this is almost impossible if very high wheels are used, unless the cylinders are too large for the rest of the road.

As these high-speed, long-distance trains cannot be heavy, it appears to us that the best type of engine would be one with 18 inches cylinders, 26 inches stroke, 1400 square feet of heating surface, 20 square feet of grate, and single drivers carrying about 18 tons, and 6 feet 8 inches in diameter, provided with the sand-blast. Such an engine would be an admirable bill-climber, and would run about as

fast as any locomotive made. When the runs are over comparatively level roads, then a high wheel, such as Mr. Stirling proposes, is no doubt good, because its use reduces wear and tear.

Whether any extremely fast running will be done in this country remains to be seen. Any speed that can be attained in the United States can, of course, be got here on our better roads; but it is more than questionable that these excessive speeds pay. Whether they do or not is really the whole question. The problem is not one for the locomotive superintendent, but for the general manager.

HOW LONG IT TAKES TO MAKE A GOOD MACHINIST.—Prof. Sweet, an able writer and a man of large practical acquaintance with mechanics, says: A good machinist can be made in less than three years. I don't believe every young man can be made into a machinist in that or any other length of time, but I believe likely young men can be made into good machinists about as Josh Billings believed in the universal salvation of men: He believed it, but he wanted to pick the men. I once had a young man work for me somewhat on the plan detailed by J. A. Gilkinson, in his communication headed: "An Industrial University." This young man wanted a job badly. There were particular reasons why he should be earning good wages, and he made an agreement with me to be paid just what, in my estimation, he earned each week, except for the first, for which he was to receive \$4; just enough to pay his board. It never seemed to trouble this man to learn. His mind was on his business, and his whole heart in it. I fully believe that half the kinks and makeshifts employed by old lathe and planer hands were reinvented by this man as needed by him. He used common sense, backed up by good brains, and in less than six months was worth journeyman's wages to me, and he got it.

SKILL RUNS IN THE FAMILY LINE.—It is well known that the Japanese are very skillful workmen, and the reason for this is undoubtedly accounted for in the following extract from an exchange: In Japan apprentices begin to learn their trades usually much earlier than in our country, so that when majority is attained the mastery of the crafts is thorough. Another striking feature of the Japanese system is that of heredity. Skill runs in family line. Not a few of the famous artisans of the present decade are descendants in the ninth, tenth and even twelfth generation of the founder of the establishment. A carpenter in Fukui can boast of his ancestry of woodworkers through 27 generations; and the temple records show such hoarding to be true, though often adoption interrupts the actual blood line. At a paper-makers' establishment in Awotabi, in Echizen, the proprietor's ancestors first established the industry a thousand years ago. The same as above, so far as skill in the family goes, is as true of China as of Japan.

MAKING STEEL BALLS.—Mr. Fairbairn of Manchester, England, has devised a machine for making steel balls, in perfect spheres. The machine is provided with two horizontal disks, each having on one of its faces a spiral groove starting from near the rim and ending at the center. The disks are placed one above the other, the lower one having a hole in the center through which the completed ball drops. The disks revolve in opposite directions. In operation, a heated steel bar is placed between the outer rim of the disks, a piece of the proper size is at once cut off by the machine, and carried through the grooves to the center, when it is dropped a nearly perfect sphere, needing only a little shaping in a proper machine to make it a perfect sphere.

WELDING CABLES BY ELECTRICITY.—Some very interesting experiments in welding cables by electricity, for use on cable roads, have recently been made by the Thomson Electric Welding Company. It has been demonstrated, so it is claimed, that while by means of a splice 30 per cent only of the strength of a perfect cable can be secured; by an electric weld, which can be readily made, 87 per cent of the efficiency can be attained, thus proving the greatly superior efficiency of the latter method of making joints on cables employed for traction purposes.

SUSCEPTIBILITY OF IRON TO BECOME BRITTLE. It has been found by experiment that, as regards chemical composition, the susceptibility of iron to become brittle by pickling and rusting is least in cast iron and silicon steel, and highest in wrought iron, and, according to Bidecer, in high carbon steel. Combined carbon appears to increase the action and silicon to diminish it. The influence of manganese in either direction has not as yet been determined.

German engravers harden their tools by heating them to a white heat and then plunging them into sealing wax, continuing the operation until the tool cools. By this method, the steel becomes almost as hard as a diamond, and when touched with a little oil, is excellent for engraving or for drilling into other metals.

A UNIVERSITY CHAIR OF LABOR.—The first chair of labor ever instituted in Europe was decreed by the Paris Municipal Council, last July. Henry Reville has been named as professor.

SCIENTIFIC PROGRESS.

Progress of Electro-Magnetic Science.

Discrediting upon the progress of electro-magnetic science, Prof. Arthur E. Kennelly recently observed that the following facts seem to have been fully established: First—in electro-magnetic science the great achievement since Faraday's time has been the determination that all electricity flows, or tends to, in closed curves or circuits, so that we have the electro-static circuit, the galvanic circuit and the magnetic circuit, each resembling, as it were, an endless chain, or a bundle of endless chains; and the laws which control these three different types of circuit show wonderful analogies. Second—the due appreciation of the influence of the ether and its importance in all electro-magnetic phenomena. While originally the electrical activity seemed to be confined to the battery or conducting wires of a galvanic circuit, it is now believed that the ether surrounding these conductors plays fully as active a part in the process of conduction, and the mind sees free space no longer void, but filled with an active and responsive substance—the ether. It looks almost as if matter were inert in comparison with the ether which surrounds it. Third—the evidence in favor of the proposition that light is a vibratory disturbance in the ether of an electro-magnetic nature is such as almost to amount to demonstration. When this shall be generally accepted, the whole domain of optics and radiant energy will be enrolled as one department and property of electro-magnetic physics. Light, although seemingly so unsubstantial and powerless, is labor, and requires force to generate it. Every ray of light that vibrates in space is full of force and energy. Every ray that comes to us is the product of chemical labor applied to distant stars by elements such as oxygen, carbonic acid, etc., in the fierce tumult of chemical union and decomposition. The day will surely come, says Leo Silberstein, in which electricity will be generated directly from the heat of burning dynamos.

Fluorine Flames.

In connection with the research that is being made into the problem of the production of light by other means than by combustion, it is of interest to remark some of the experiments of M. Moissan upon the gaseous element fluorine, which he has recently succeeded in isolating. Fluorine seems to answer to that ideal conception of the old alchemists—the universal solvent. It possesses most intense chemical activity. The gas is obtained by electrolysis, conducted under a variety of ingeniously devised conditions necessitated by the corrosive nature of the product. Many different sorts of flames are produced by allowing fluorine gas to come into contact with other elements. With hydrogen, combination takes place explosively even at a temperature of -23° , and in the dark. If a tube delivers fluorine into an atmosphere of hydrogen, a very hot blue flame, bordered with red, at once appears at the end of the tube. Bromine vapor combines with fluorine in the cold, with production of a very bright, but low-temperature, flame. Iodine gives a pale flame; phosphorus and arsenic combine with fluorine with lively incandescence. Carbon in a finely divided state combines with fluorine even at ordinary temperatures. Purified lampblack inflames instantly with great brilliancy, as do also the lighter varieties of wood charcoal. The amorphous variety of boron likewise ignites instantly in fluorine, with projection of brilliant sparks; but the most heartful of all these extraordinary displays of chemical activity is the reaction between fluorine and silicon. The cold crystals immediately become white hot, and then burn with a very hot flame, scattering showers of stars in all directions. Many other substances burn in fluorine, according to details published by M. Moissan in the *Annales de Chimie et de Physique*. The reason for some of the flames produced being of low temperature, though of high illuminating power, is a matter demanding further investigation.

PRACTICAL AND SCIENTIFIC KNOWLEDGE.—All knowledge, remarks a contemporary, is comprised in two classes. The first is that effect of mind which is the result of curiosity, that species of human instinct which prompts us to inquire the reason for everything we see, every action which takes place among others, among all living beings, among the elements and among the celestial bodies. Mankind being endowed with reason, the next impulse is to apply the knowledge so gained to some useful purpose, to produce some benefit to ourselves. The first of these two classes is called "scientific investigation," the second is called "applied science." For instance, we notice for the first time a light from which smoke arises; we investigate, we perceive heat, and that it produces a disagreeable sensation. These are the first scientific facts. We apply the knowledge so gained by resolving never to touch fire. This is applied science. We have employed curiosity to find out the facts. We now employ caution to guard ourselves against damage, and we determine never to touch fire. All knowledge so gained is by this process; we may be told a thousand times that fire will burn, but we feel that that is only theory. We want facts, and we obtain them by a course of scientific in-

vestigation. We use these facts and thus gain experience, knowledge, at first scientific, next practical; and these two conditions make up the sum of all knowledge. Science is the foundation, practice the superstructure.

THE CAUSE OF GEYSERS.—Bunsen has explained the periodical eruption of geysers in such a satisfactory manner that doubt is no longer possible. A cavern filled with water lies deep in the earth, under the geyser, and the water in this cavern is heated by the earth's internal heat far above 212° , since there is a heavy hydrostatic pressure upon it arising from the weight of water in the passage or natural stand pipe that leads from the subterranean chamber to the surface of the earth. After a time the temperature of the water below rises, so that steam is given off in spite of the pressure, and the column in the exit tube is gradually forced upward. The release of pressure and the disturbance of the water then cause the contents of the subterranean chamber to flash into steam and expel the contents of the exit pipe violently. These eruptions may also be provoked by throwing stones or clods of turf into the basin of the geyser. The water in the cavern below is disturbed by this means.

THE PROBABILITIES OF A CELESTIAL CATAclysm.—A German astronomer, Herr Jager, has arrived at the conclusion, based upon observations made by Mons. Hormonn on the movement of 49 stars in the vernal region, that the solar system, with reference to the relative positions of the visible stars, moves with a velocity of 20 miles per second; the mean speed of the so-called fixed stars being about 27 miles per second. Herr Jager goes further; by means of calculations analogous to those of the kinetic theory of gas, he estimates that each star encounters another in 325 billions of billions of years. The probabilities of a celestial cataclysm consequent upon the impact of two or more sidereal bodies are therefore apparently very remote.

IMPROVEMENTS IN SUGAR MANUFACTURE.—It is said that recent improvements that have been made in the manufacture of sugar from the sorghum plant deprives the sugar of an objectionable flavor which it has previously had. It is also claimed that by the new process the yield is materially increased. The new process is thus, in part, described: "Alcohol is mixed with the sorghum syrup, and after treatment the former is recovered by redistillation, so that there is no appreciable loss. In the use of five barrels of alcohol, only a quart or so was lost. The sugar is nearly white, and it is strong in saccharine qualities—above 90 degrees."

THE REPORT FROM SMOKELESS POWDER.—According to Hiram Maxim, who is probably as well acquainted with the matter as any other person, the discharge of a rifle loaded with smokeless powder is not noiseless, as is generally supposed. There is no such thing, he says, as noiseless gunpowder. The report from a discharge of smokeless powder is much sharper and higher-pitched than that from black or ordinary gunpowder; it cannot, however, be heard anything like so far away. The recoil of the piece is much less, also, with smokeless powder.

THE SELF-PURIFICATION OF RIVERS.—Professor von Pettenkofer has been studying the Isar River, which flows through Munich, carrying the city's sewage. He says that five miles below the city there is not a trace of the pollution which finds its way into the river. Some observers have thought that the self-purification of rivers is due to deposition of sediment. Dr. von Pettenkofer, however, maintains that the real agent at work in purifying the Isar river is the oxygen of the air which is absorbed by or dissolved in the water.

THE BIRTHPLACE OF COLUMBUS.—The savants and historians of Italy are now deeply interesting themselves in the question of Columbus' real birthplace. Five or six places besides Genoa claim the honor, and among them is Bettoia. It is reported that proofs have lately been discovered establishing Bettoia's claim, and that the town will erect a monument to Columbus at once, and intends to send an envoy to the World's Fair with these proofs and other historical documents of interest.

THE EARTH'S AXIS UNSTABLE.—Since it has been ascertained with a good degree of certainty that the earth's axis is unstable, to a certain extent, all scientific calculations based upon the assumption that the axis is permanent are misleading. This, it is claimed, accounts for the miscalculations of astronomers during the past 200 years.

COLOR FOR WAR SHIPS.—The French are now painting their war vessels a dull, sulphurous gray, exactly the color of smoke as it rises from cannons. They say this color has the advantage of being as filthy and indistinguishable in fog and sea mists and darkness as during the smoke of battle. It is more baffling to the search light than any other tint.

A MODE OF OBTAINING ELECTRICITY.—It is said that a Frenchman has invented a new and ingenious frictional machine. Mercury is forced by means of a pump through the pores of a piece of cambric, and electricity in considerable quantities is generated by the friction.

ELECTRICITY.

Electro Culture.

Interesting Experiments with the Electric Light on Leaf Plants, Tubers, etc.

A most interesting and extensive series of experiments was made by Professor Bailey at the Cornell University Experimental Station at Ithaca, N. Y., during the winter of 1889-90 from the report of which we condense as follows:—A conservatory was divided into two compartments in one of which plants were treated in the ordinary way, with sunlight by day and darkness during the night. In the other compartment the same class of plants was subjected to sunlight by day and the electric light during the hours of darkness. The conditions of temperature were kept equal in both compartments. The object of the experiments were to note the effect which the electric light might have by supplementing it during the hours of darkness on the growth of plants.

The house was low, as to the ceiling, with a flat roof, and 20x60 in area, divided by a tight board partition and warmed by steam. In the part where the electric light was used, the lamps were hung low—2½ feet above the soil in which the plants were grown.

The general effect of the light was to greatly hasten the growth and maturity of most of the leaf plants. Those plants nearest the lights grew more rapidly than those a few feet farther away. This tendency was particularly marked in leaf plants, such as spinach, arcess and lettuce; but the plants tended to "run to seed" before the edible leaves were formed. The spinach, under the influence of the electric light, matured and produced good seed, while that in the dark at night was still making large and edible leaves.

The most marked and favorable results were obtained in the growth of lettuce. Three weeks after transplanting, those under the influence of the electric light were fully 50 per cent in advance of those grown in the dark house. The heads from the electric light were placed on the market two weeks earlier than those grown under the usual conditions.

Ridishes showed very unfavorable results, so far as size was concerned; but they were much earlier in maturing. It was found that the electric light exerted a much more favorable influence when it was covered by a thin glass globe than when naked. It was surmised that this difference arose from the supposed fact that the glass absorbed or obstructed the highly refrangible and invisible rays. The experiments, on the whole, seemed to justify the conclusions that, while the naked electric light has a damaging influence upon the plants near it, electric light promotes assimilation; it often hastens growth and maturity; it is capable of producing natural flavors and colors in fruits; it often intensifies colors of flowers, and sometimes increases the production of flowers, and that periods of darkness are not necessary to the growth and development of plants. Professor Bailey believes it is only necessary to overcome the difficulties, the chief of which are the injurious influences upon plants near the light; the too rapid hastening of maturity in some; and, in short, the whole series of practical adjustments of conditions to individual circumstances to render electro-horticulture a success. Deherain, a French experimenter, says that the injurious rays from the electric light are greatly modified by a transparent glass. Professor Bailey's experiments with an electric lamp, protected by an ordinary white opal globe, gave results much less marked than that of the naked light; in a word, the injurious effects were lessened by the use of the globe.

Some of the experiments show that injury follows the use of electricity when that light is used at a critical time, as, for instance, when the young plant is losing its support from the seed and is beginning to shift for itself. The best results seem to follow the later use of electric light. On the whole, the opinion is expressed by Prof. Bailey that there is a future for electro-horticulture, when all the conditions of treatment are fully understood. Further experiments will be made and reported upon as soon as the results are reached.

AMERICAN AND ENGLISH ELECTRICAL ENGINEERING.—Some of our traveling transatlantic cousins are indulging of late in lugubrious letters to their home journals on the asserted bad construction and generally loose work of electrical engineering on this side of the Atlantic. These observations are generally characterized by very loose statements and hasty conclusions, which will not bear a very close scrutiny. A test, however, will soon be forthcoming at Chicago, which will show to the world the truth in this matter. European electricians will be invited to place their work by the side of similar American work in electric service. Of course, both sides will be put upon their mettle for good work, and the result will be a prodigious display, such as has never yet been placed before the world at any exhibition. Americans have no fear of the final outcome.

ELECTRIC LAUNCHES AT SEATTLE.—It is reported that a Seattle electrical expert is fitting up a number of launches for Lake Washington with storage batteries, by which they will be propelled, charged from the trolley wires of electric railways. These will be the first electrically propelled water craft on the

Pacific Coast, and will run for eight hours without recharging. They will be constructed on the Herreshoff model, with a speed of from eight to ten miles per hour. Launches of the same pattern are said to be in common use on the river Thames. It will require four hours to charge one of the batteries, but the added weight after recharging is inappreciable, so that it is carrying a power that is of no burden to the boat. In connection with the above, we notice a proposition for a bicycle elevated road, to be operated by electricity, between Tacoma and Seattle. The distance is 36 miles, and it is estimated that it will take but 40 minutes to make the trip, whereas by steam it requires an hour and three-quarters.

New Electric System.

It is said that a new electric railroad system has been tried in Europe, in which neither poles, wires, nor storage batteries are used. The Chicago News says that the system is to be tried in that city at once, and describes it as follows:

"The electric current passes through a conduit beneath one of the rails, but not in contact with it. The current does not touch the rail and there is no danger from electricity by reason of coming in contact with the tracks. The voltage is so low that in case of a shock being given there would be no ill effects. But this is said to be impossible, for every portion is so well insulated that none of the current can escape. The rail is double, with an aperture in the center, through which connection is made with the current in the conduit. The other rail may be used as it is used in the ordinary street car track. In outward appearance the electric car is similar to the ordinary street car. The motor is below the carriage, enclosed in a protecting box placed between the axles. The power is applied by means of a chain-gearing working over a cogwheel on one of the axles. Below the platform are appliances that enable the driver to regulate the speed of the car. It is claimed that the road can be operated much more cheaply than the ordinary electric line, as it requires a much less voltage."

Considering the rapidity with which new devices in relation to electric railway traction are being brought forward, there need be no fear but that the world will soon be put in possession of all that is needed to make that mode of transit a complete success. We may have to put up with much inconvenience in the way of trolley wires, unsatisfactory storage batteries, etc., and even large amounts of money will be lost in the various unsuccessful improvements suggested. These things are all inseparable from all great pioneer enterprises; but the public will eventually find exactly what it wants and be happy.

SWITZERLAND seems to have taken the lead of the world in the electric transmission of power, at least so far as number of enterprises is concerned. The contracted limits of her territory are somewhat of a hindrance to long-distance transmission, but the energy displayed in this regard in Switzerland is worthy of all praise. We have before us 17 cases of electric transmission in that country already in operation, besides several now in course of construction or fully decided upon. One of these latter will transmit by means of five turbine wheels of 350 horse power each. The work is being done for some extensive spinning mills. Four aables are employed, each having 0.437 of a square inch section, and they are carried on towers across a river span of 336 feet. At the power station there are two dynamos of 300 horse power overcompounded, and there are three motors at the mill—one a twin machine of 350-horse power and two of 60-horse power in different parts of the premises. The commercial efficiency of the plant at full load is 78 per cent. The cost of the installation was \$68 per horse power delivered, and the cost of power is \$14 per horse power per year at the rope pulley of the turbine.

ELECTRIC LIGHT IN FOGS.—Evidence seems to be accumulating in regard to the inefficiency of the electric light in fogs. According to *Electricity*, the pilots of Havre complain of the lack of penetrating quality observed in the electric lights in the harbor. They say that during foggy weather, the brilliancy of the electric light is much more reduced than that of oil lamps—so much so that in very foggy weather while the light from oil lamps was plainly visible, it was impossible to discern that of the electric light. The London *Electric Review* states that the electric lights in some of the lighthouses, especially those near the entrance to the Thames, sometimes become invisible, while at the same time the lights from the lightships and lighthouses burning oil and even the gas lamps in towns on the neighboring coast are plainly visible.

ELECTRICITY VS. COMPRESSED AIR.—Mr. Albion T. Snell made the statement before the South Wales Institute a short time ago that he had demonstrated that electricity would pump water or haul coal with an efficiency which was something like double that obtained by compressed air.—*Electricity*.

THE ELECTRIC LIGHT IN FACTORIES.—The benefit of the electric light in the factories of Germany is said to have been so marked that it is proposed to make its use compulsory in all works where artificial light is employed during working hours.

GOOD HEALTH.

A "Home" for Cancer Patients.

In view of the alarming increase in this city of the dreadful melody known as cancer, and the want of adequate facilities for the proper care and protection of those who come here for treatment, several of our philanthropic citizens, many ladies among them, have for some time been looking about for a place and site for means for the establishment of a "Home," where those thus afflicted might find shelter and proper home comforts, while under treatment for cure, or while suffering the tortures which are inseparable from the more advanced condition of this malady, under which no treatment can save, but merely ameliorate sufferings which end only in death. Such a home is especially needed in this city, which is the natural and most convenient resort for treatment of those on this coast who are afflicted with this malady.

Those interested in this humane work have finally met with the fullest success at the hands and through the favor of a most worthy and active association of benevolent ladies known as the "King's Daughters." This association has recently been placed in possession of the building owned by the city and occupied by the Old People's Home up to the time that, through the benevolence of Mrs. Charles Crocker, that association came into possession of their new quarters on Pine street.

The "King's Daughters" have refitted and refurnished this building, and made of it a most homelike and comfortable dwelling-place for invalids, for which purpose the city allowed them the use of the premises.

On looking around for inmates for their new Home, their inquiries naturally led them to consider the condition and needs of the large and increasing number of those unfortunate who are afflicted with the generally unpossessioned melody of cancer. Pursuing their inquiry in this direction, they soon became acquainted with the fact that that class of invalids were greatly in need of just such a place, as they had to offer. They moreover were made well cognizant of a further fact of which they only previously had dim knowledge—that cancer patients were being successfully treated in this city, and restored to health without the use of either plaster or the knife, or any other treatment which entailed pain or suffering beyond that which was inherent in the malady itself.

After full inquiry and consultation, it was determined to devote a portion of their rooms to patients undergoing such treatment, and to install the practitioner, Mrs. C. A. Cook of 224 Post street, who is the discoverer and dispenser of that benign treatment, in charge of such patients.

Within one week after the rooms were ready, five patients, each with a nice cozy room, were enjoying the accommodations offered, and the treatment, all of whom are now doing well, with every prospect of an early and complete cure. Several other rooms will soon be occupied by the same class of invalids.

It is One of the Most Remarkable Facts Connected with medical practice, that, of all other maladies, this one alone is regarded by the profession as absolutely incurable. Such an opinion has been held by them so long that it has become obnoxious, and seems to be an ineradicable from the minds of a majority of physicians as is the malady itself from the bodies of their patients by their mode of treatment.

If the work so well begun by the good "King's Daughters" should result in eradicating this nonprogressive and false idea from the minds of our conservators of health, they will have accomplished a work which will entitle them to a monument bigger and more beautiful than any such structure ever yet erected; for it will lead to the saving of more lives from terrible deaths than have been sacrificed by all the great military heroes in whose memory the chief of all the great monuments of earth have been erected.

The "King's Daughters" constitutes one of the leading benevolent associations in the country, and doing an immense amount of good. They number over 1000 in this State and fully 30,000 in the Union. They have State and National organizations, by which the work of each society is known to all the others. Through this organization, the work of this society will in time be made known throughout the Union, and the good news, which will soon be made evident in this city, that cancer is curable, will in time reach the stricken victims everywhere and lead to a movement which will eventually place the San Francisco treatment within the easy reach of every city and town in the Union—and the world as well.

Yes, the Remedy Is a Secret One,

And so was Koch's; yet the "regulars" from all over the world rushed to Berlin to get the secret remedy, learn its mode of application, and take it to their homes for trial. No matter if it was a failure. The principle involved was all the same. A medical man of high standing was the discoverer. In the present case the discoverer is a woman of humble practice. But what of the secrecy. All that is asked for is a medical investigation to prove either that the remedy is what is claimed for it or that it

is a swindle. The doctor invites the test. If no competent medical authority in this city will take up the glove, is it not fair to suppose that they dare not do so? If they dare not do it, can any but a sinister motive be the hindrance? If the faculty refuse to investigate, the work which has now begun will soon speak for itself and settle the matter to the satisfaction of all reasonable persons.

But, further, with regard to the secrecy of the remedy, our healer may lack science, nay, she may be even selfish, if you please, holding the knowledge of a remedy for private gain, when the scientific profession would give the same to the world. Such things are a minor consideration and should have no weight whatever when the lives of thousands are at stake. The fact, which are within the reach of every one, are that scores of cancer sufferers in this city are constantly receiving permanent relief by purely constitutional treatment, without the use of the knife or amputation. The most of these cases have been pronounced unmistakable cancer by leading physicians and surgeons, and many have submitted to previous surgical operations, without any beneficial result. This assertion is made with due regard to its import, and proof will be presented to any one interested, by the writer, whose initials are well known in this city. With these facts in view, which are well known to hundreds of our citizens, it would seem that the theories and antiquated ethics of the doctors are entirely unworthy of consideration. W. B. E.

USEFUL INFORMATION.

A Substitute Needed for Whalebone.

As is well known, whalebone is getting to be a very scarce article and very high in price. The catch of whalebone by our whaling vessels for the year 1854 was 3,445,200 pounds; for the year 1870, 703,000 pounds; for the year 1890, only 300,710 pounds. The average price of whalebone in the raw state, as taken from the whale, for the year 1854, was 34 cents per pound; for 1880, \$2 per pound; for 1890, \$4.22 per pound. The figures show that the supply is rapidly diminishing, while the price is continually increasing, and the entire product could be consumed many times over for any one of the uses for which it seems particularly adapted, and from its high price, it is evident that some substitute must be used. Whipl manufacturers are feeling the scarcity and high price of the material more than any one class of consumers. The nearest to a practical substitute yet found is featherbone, made from the large enameled quills of the goose and turkey. Featherbone is very durable and elastic, and is now being used largely in the manufacture of whips, and though much cheaper, possesses more of the nature of whalebone than any material yet found.

The whale fishery, from which the supply of whalebone is obtained, is very rapidly decreasing. Fifty years ago, the business was at its climax, and there were 735 vessels engaged therein. In 1856, that number had been reduced to 159. According to the Census Bulletin, No. 123, just issued, there are now only 101 vessels in the trade, of which 27 hail from San Francisco, and 70 from Massachusetts. The decline of whale fishing is due more to scarcity of whales than to the introduction of mineral oil.

The Behring straits fishery commenced in 1848. In 1851, that branch of the business numbered 250 vessels. There are now only 65 thus employed from the entire country.

FLUID FOR RENDERING OIL PAINT INDELEIBLE. This invention is chemical in its nature, and will rank among the valuable discoveries of the time. It has the effect of preserving the colors in their full strength, and, being transparent, will not modify the character or hue of the various colors, but will prevent subsequent dimness from exposure. The ingredients are readily attainable and not at all expensive. The formula can be obtained, together with legal authority, for its use, by persons disposed to business. This compound of fluid and paint may be used in etching or painting designs upon all kinds of fabric, including silk, satin, velvet, plush, cheese cloth and canvas, and makes a mark which is acid resisting and water resistant, and hence highly desirable. The fluid is also valuable for thinning down paint, and it constitutes a drier which causes the paint to dry quickly, and thus facilitates finishing up oil paintings. This compound is of great value, and is in a line of commodities which has great demand. The inventor is Mr. Richard W. Surry of Battle Creek, Mich.

THE NOISY WHISTLE.—In most cities and large towns in the Union, the morning whistle of the steam plant is heard. It sounds its lengthy note from six to seven in the morning and is what may be called, without stretching a point, an unmitigated nuisance. There is no good reason why a man with a one-dollar clock shall not know when to get up and when to go to his work. The whistle on workshops is one of the things that ought to go. Moreover, it should be borne in mind that the steam which blows the whistle is lost for usefulness in driving the engine.

LONG-LIVED FISH.—Hundreds of fish are still alive in the royal aquarium in St. Petersburg, which were placed there from 100 to 150 years ago.

Passing Events.

Anticipating the request of the State Mining Convention, a Congressman from this State has already introduced a bill providing for the construction of debris-impounding dams; and also providing for a system of licensing the gravel mines, so that they may be worked. This is a step in the right direction, and may well serve as an indication that Congress will take the subject up and act upon it in one way or another.

Several instances are reported this week where companies have commenced systematic prospecting operations with diamond drills. It is probable that in the future this plan will be largely followed, and much time and money saved.

The various mining counties of the State are preparing, by local conventions and meetings, for the State Mining Convention, which meets here January 20th. It bids fair to be a large and enthusiastic gathering of mining men.

The Fresno county stone quarries in 1890 yielded 10,607,000 pounds. In 1891, the output was 16,044,000. The increase shows that the use of stone in architecture is gaining in public estimation. The county has an exhaustless quantity of building stone of excellent quality.

Announcement.

On the first day of the new year the proprietorship of the MINING AND SCIENTIFIC PRESS was transferred from the firm of Dewey & Co. to an incorporated company, which has assumed the title of the Dewey Publishing Co. In the firm by which the paper was established in 1863, and by which it has since been published continuously, Mr. A. T. Dewey and Mr. W. B. Ewer were equal partners. In the incorporated company, each of these gentlemen holds a one-third interest, and the other third is held by Mr. Alfred Holman, who, as general manager, assumes the active administration of the business. By way of introducing Mr. Holman to the patrons of the MINING AND SCIENTIFIC PRESS, it may be said that he comes from the editorship and general management of the chief newspaper of Washington—the *Post-Intelligencer* of Seattle—and that prior to his connection with that journal, he was for many years with the *Portland Oregonian*.

The patrons of the paper should know that the incorporation has no other purpose than mere business convenience. There will be no revolution in the character of the paper, though it is hoped very shortly to add to it some features that will commend themselves to the public. Of the designed improvements, it is perhaps as well not to make promises, but it is hoped that the efficiency of the paper will be increased and that it will continue to receive from the public the favor which has attended its course during the twenty-eight years of its existence.

The firm of Dewey & Co., Patent Agents, composed of A. T. Dewey, W. B. Ewer and Geo. H. Strong, is not included in the incorporation and will continue to be conducted as heretofore under the name of Dewey & Co., Patent Agents.

To Regulate Hydraulic Mining.

The agitation of the question of permitting the hydraulic miners of California to again resume operations is already beginning to be felt in Congress, to which body, in fact, the solution of the matter must ultimately be referred.

Representative Geary has introduced a bill which provides that the President shall appoint three engineers who will comprise the Mining Commission of California, and all persons intending to mine by the hydraulic process shall apply to the commission for a license, giving a description of the land, the mode of mining and the appliances to be used. If the commission is satisfied that the mine can be operated without material damage to the rivers a license will be issued, but if the commissioners should find that damage would result unless dams or other works were built, it will be their duty to see that these works are properly constructed, and then they will be empowered to issue a license.

Mr. Geary sets up a definition for "material damage," which the Commission will be compelled to interpret closely. It is this: "When the amount of debris accumulated in the river is no greater than the amount of alluvial or other deposits caused by ordinary farming, then there is no material damage, but when the debris of hydraulic mining is greater than the amount deposited by farming, damage is being done, and the license shall not issue."

The bill also appropriates \$250,000, to be spent under the provisions of what is known as the Biggs bill for the construction of two dams, one at Bolard's bar in Sierra county, and the second on the north part of the Feather river, at some point to be designated by the Commission, the work to be done under the eye of the Secretary of War.

There is nothing in this bill of Mr. Geary's to which great exception can be taken. The U. S. engineers, who have already examined the mining and farming country in the region where the trouble exists, have reported that there are isolated cases where hydraulic mining can be carried on without damage to other in-

terests. They have also reported that in most other cases a system of dams will restrain the heavy debris so that the mines can be operated. It is probable that the miners would be satisfied with the decision of a Board of disinterested engineers as to whether any particular mine could be run or not, for that would be a relief from the present system where the decision rests with a judge who knows nothing of mining matters, and who has his ideas on a common law established where very different conditions prevail.

As to the definition of "material damage" in comparing the amount of "wash" from the mines or farming lands, that would probably not be a bar to mining, since the dams would restrain the larger proportion of the debris, which would not then injure the rivers.

Mr. Geary's provision for the construction of two dams by Congress is about what the miners intend to ask for at the coming convention in this city. They know very well that they must ultimately build the dams, but if there is any experiment about it, or any danger of the dams being condemned, the onlay for the typical dams to test the matter should come from the Government.

The Mining Convention.

The miners of California can congratulate themselves on the fact that their proposed convention in this city on the 20th inst. is receiving favorable attention from the press and public. As it gradually comes to be realized by those who have given the subject no thought, that the miners are asking nothing unreasonable, and that they only want to be permitted to conduct their business in a way that shall injure no other interests or individuals, there is a disposition to "give them a fair show." Their project has thus far met with approval on all sides. Of course there are a few men who cannot see and do not want to see any attempt at renewal of an industry that has committed damage in the past; but the people generally are willing to see the miners meet, and hear what they have to say, and willing to drop all prejudice. Already three of the daily papers of this city—the *Examiner*, *Chronicle* and *Post*—have editorially inclined in favorable terms of the convention and its purposes, basing their opinions on the proposition that the miners only want to work their claims in a way that no harm shall be done to others.

It has been long since such expressions have appeared in any of our large city dailies, and this is one of the straws which shows the change in public opinion in the past few years. It is even to be noted that at a meeting of a County Farmers' Alliance, resolutions favorable to hydraulic mining have been passed, if conducted on the basis proposed.

The merchants of this city are also favorably disposed. They have long felt the loss of trade due to the closing down of an industry which was a productive one, and which put large amounts of money in circulation every year. They, like others, are tired of the controversy between the miners and farmers, and now that disinterested engineers, appointed by the Government, have suggested a basis of settlement, want to see the plans tried.

The miners themselves, when they meet in this city on the 20th, should remember that they have the sympathy of a large portion of the public in their misfortunes, and should do nothing to alienate this feeling. If they only demand what is recommended by the Government engineers, no fault can be found with their action. Competent authority has come between the two contending factions and pointed out a method which each should accept. It is useless to attempt any other plans or try to evade the opinions of the engineers. Thus far, judging by the resolutions adopted at the different county mining conventions, there is no disposition on the part of the miners to ask for more than has been recommended. But they do want Congress to let them work on the plan suggested by the men appointed to settle the matter.

Safety in Mining Cages.

Just one year ago this week, an accident occurred in the Utica mine, at Angels, Calaveras county, where, by the parting of the cable, the skip was dropped 450 feet down the shaft and 12 men were killed. Very naturally, Mr.

Lane, the superintendent of the mine, began to provide against any future accident of the kind and looked out for some safety device not depending upon the cable or king-holt tension for its effective action in case of trouble. The rope that broke was a new steel wire one, warranted to hold 40 tons, and the ordinary safety devices were on the cage.

Some little time since, Mr. Lane applied to the mine cage a safety device invented by Henry W. Bracken, then of Virginia, Nev., but now a resident of this city; and in order to prove its efficiency, put it to some pretty severe tests. Mr. Lane showed his faith in the merits of the appliances by standing on a loaded skip in the shaft when the connection was let go, by cutting the rope or unditching the hoisting reel. In each case, perfect success was the result. The sudden drop was instantly checked by the prompt action of the safety device clutching fast and immovably to the guides on each side. In this, Mr. Lane took the same chances for death as he fell those unfortunate miners in this same shaft a few months before. He took the same chances of similar horrible accidents that have occurred in the Trojan, Imperial, Tioga, Sharon, St. Lawrence and many other mining and elevator accidents.

The novel feature of this safety clutch is that it is independent of the cable altogether, and is attached to the bottom of the cage. The safety clutches are actuated by the pressure of air upon air wings or arms, which receive the pressure of the air in the shaft, thereby operating the clutch. The frame is formed of iron, and the wings of light sheet metal inserted in axles, and a housing of sheet metal, sufficiently strong to hold the pressure of air. In any rapid descent of the cage in the shaft, the air is met directly by the wings. These wings then rise, revolving the dogs and causing them to clutch the guides. This device can be adjusted so as to descend by a limited speed, and will stop a fall as readily from an unlatched reel as from a broken rope over or under a sheave. Thus, any undesired rate of speed will cause it to instantly clutch the guides and hold the cage. The operation is so immediate that there is no opportunity for the cage to attain a speed sufficient to break the clutches or tear out the guides. This is a new principle in cage safeties, and it has proven satisfactory at the Utica mine.

The San Francisco Delegates.

At the request of the Miners' meeting, held in this city, the Mayor of San Francisco has appointed as delegates to the State Mining Convention the following gentlemen:

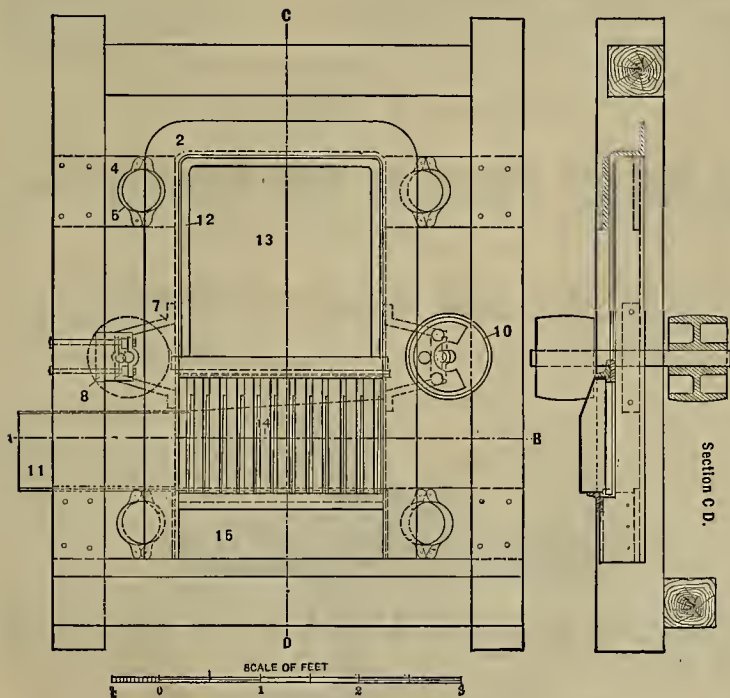

Jno. Hays Hammond.	Luther Waggoner.
Thos. K. Church.	E. Charonak.
W. S. Hobart.	W. C. Ralston.
Ross E. Browne.	Chas. S. Wieland.
Janis Janin.	F. A. Huntington.
R. McMurray.	B. F. Lacy.
E. W. Chapman.	Austin Walrath.
Chas. G. Yale (of the MINING AND SCIENTIFIC PRESS).	Wm. S. Chapman.
H. Pichoir.	Wm. Johns.
L. L. Robinson.	Judson Wheeler.
J. K. Thornton.	J. O. Whitney.
E. P. Marcellus.	J. C. Stump.
Geo. W. Grayson.	Philip Doideshelmer.
Thos. Price.	S. E. Holcombe.
Columbus Waterhouse.	J. H. Thomas.
E. Wheaton.	L. P. Drexler.
W. August Knapp.	F. Reischling.
Wm. Young.	J. S. Robinson.
Wm. Irelan, Jr. (State Mineralogist).	Simon Foreman.
J. M. Adams.	J. C. Rued.
J. D. Fry.	George Cox.
R. B. Pond.	Almarie B. Paul.
Robert Sherwood.	Henry G. Haaks.
M. W. Belshaw.	Jno. W. Coleman.
Francis Smith.	Thos. Brown (Bank of California).
Sam'l P. Pentis.	Wm. S. Lyle.
Felix Chappellett.	Egbert Judson.
A. J. Bowie.	J. L. Flood.
C. A. Luckhardt.	Jas. G. Fair.
Thos. Bell.	Paris Kilburn.
J. B. Randol.	E. C. Everson.
Jno. Treadwell.	Albert P. Brayton.
Sam'l J. Hendy.	John McNally.
F. Formhals.	

All of these gentlemen are either mine owners or in business directly connected with the mining interests. The names were selected only after careful consideration. Many others were suggested as prominently identified with the mining industry, but were omitted from the list mainly because it was desired to have as delegates only those persons who would give personal attention and time to the meetings. There are in the city numbers of men who have made fortunes out of mining, but having those fortunes, do not take the direct interest in the industry they formerly did, and leave others to do the work. For this reason some names expected among the delegates will not be found there.

The delegation meets this week to permanently organize, appoint committees, hire the hall, and make the necessary arrangements for the State Convention, which assembles Jan. 20.

Coal-Separating Machinery.

GYRATING SEPARATOR FOR SLATE OR COAL.

from this slate picker goes to one of the jigs, and by jigging, all the heavy slate is taken out. The material coming from the jig then passes over a small gyrating separator, K_1 (see engraving). This is a single gyrating table, the upper part (13) being a perforated plate with holes punched in it so as to remove any pea coal that may have got into the chestnut or may have been formed in it when it is passing through the jig, while (14) is a slate picker so arranged that the slate will only let out coal or slate too flat to go into the chestnut coal. This table which is made of angle-iron, is supported on four conical plates, the throw of which is two inches. It is counterbalanced by the four pulleys (10), when the stuff comes from the jig it passes into (13); the pea coal goes out, the coal, which is large enough for chestnut coal, passes over (14) and the finer stuff passes out through (11). The stuff passing over (15) is examined, and if there is still any slate in it, this is taken out, while the part which passes out through (11) goes to the small rolls, the slate, if in considerable quantity, being removed by hand before it is broken.

Academy of Sciences.

The annual meeting of the California Academy of Sciences was held on Monday evening last. The reports of officers and orators of the different departments were read and placed on file. Chas. F. Crocker, president of the Board of Trustees, reported that since the opening of the new building, \$22,406 had been received from rents. The society is, however, in debt to the amount of \$400,000, the sum borrowed from the Lick Trust for the erection of the building. The Academy is one of the residuary legatees under the James Lick Trust. A much larger amount than this will come to it in due time.

The museum of the Academy is now in condition for inspection, and many important acquisitions have been received during the past year. The Crocker-Stanford collection, purchased from Ward of Rochester and presented to the Academy, is at last in presentable shape, where the public can see it. It has been stored away for many years, in default of a place of exhibition. The museum is now quite creditable in appearance, and should continue to grow rapidly. People have hesitated to donate many articles of value which would have otherwise come to the institution, because the collection was not properly displayed. Under the present conditions, however, there is no reason why many articles in private hands should not be placed in the Academy collection, which is open to the public.

It is not pleasant to note, however, that the Academy is losing rather than gaining members. They only elected five new ones in the past year, while three have resigned, five have been dropped from the rolls and 11 have died. With a fine new building, good library and museum, the Academy should greatly increase its membership.

The election of officers resulted as follows: President, H. W. Harkness; First Vice-President, H. H. Behr; Second Vice-President, J. G. Cooper; Corresponding Secretary, Frederick Gntzko; Recording Secretary, J. R. Senham; Treasurer, L. H. Foote; Librarian, Carlos Troyer; Director of Museum, J. Z. Davis; Trustees—W. C. Burnett, Charles F. Crocker, D. E. Hayes, E. J. Molera, Geo. O. Perkins, Adolph Sntro, John Taylor.

The following honorary members were also elected: Otto Stoll, Zurich, Switzerland; Soreno Watson, Cambridge, Mass.; W. H. Brewer, New Haven, Conn.; Geo. L. Goodale, Cambridge, Mass.; J. A. Allen, New York City; Wm. E. Ritter, Berkeley, Cal.; Dr. Herman Graf Von Lambach, Strassburg.

The machinery necessary to separate coal from slate, etc., and size it at a mine or breaker must be so constructed as to handle large quantities rapidly. Several forms of these machines have been illustrated in late numbers of the PRESS, taken from Mr. Cox's paper on the "Iron Breaker at Drifiton." On Dec, 26, was given a general view of a double gyrating screen for sizing coal. On this page is given a plan, front and side elevation of this machine, from which its operation may be clearly understood by coal miners. In this some nine sizes of coal can be made in one box.

Referring to the ent, 2, represents the gyrating cones; 3, cone tracks; 4, front and back bedplate castings; 5, connecting box-castings for bedplate; 6, middle balance pulley; 7, vertical eccentric shafts; 8, eccentric; 9, eccentric pedestal; 10 screen box; 11, receiving lip (on back end); 12, jacket supports; 13, discharge lips (front); 14, hushing over orank pin on slide balance shaft; 15 and 16, slide balance shaft and balance pulley; 17, counterbalance; 18, orank pin on counterbalance shaft; 19, slide bed plate braces; 20, step pedestal on counterbalance shaft; 21, step pedestal on eccentric shafts; 22, upper eccentric shaft pedestal caps; 23 and 24, outer and inner laps of balance belt; 25, upper balance shaft pedestal; 26, step pedestal cap; 27, cone track bolts; 28, face plates on bottom of screen boxes for cone tracks; 29, eccentric pedestal caps; 30, driving pulley; 31, balance orank pin pedestal; 32, wrought-iron straps enveloping counterbalance.

The gyrating separator shown on this page is another form of machine. One of the great troubles in chestnut coal is the flat slate and flat coal which it is difficult to remove. We have, therefore, placed upon the main gyrating screen a chestnut slate plucker with a slit larger than would be economical, if it were to be used in the ordinary way. This slit is so large that it is almost certain to take out all the flat slate and a certain portion of coal which, though flat, is marketable. The whole mass that comes

Improvement of Navigable Rivers.

The California River Improvement Convention will meet in Sacramento on the 15th inst. Two years ago this same body met and sent a committee to Washington to appear before the River and Harbor Committee of Congress and urge an appropriation for the main rivers of this State. As no detailed plans or estimates had been submitted by the Engineers Department of the Government, nothing came from the committee labors except an order for the subject to be reported on by the engineers. The Board appointed went over the ground and studied up the subject, finally reporting the general plans of improvement decided upon.

Under previous laws, there was in existence a similar Board of Engineers, charged with the duty of examining and reporting upon the mining debris problem, and these two Boards of Engineer officers in charge of that specific work in California recommended an appropriation and an expenditure of more than \$720,000 for the improvement and protection of interior navigation in California.

Now the officers of the River Convention desire that Congress shall make the appropriations recommended by the engineers. It is the intention of the members to send a committee to urge the matter.

Among the specific appropriations asked for are these:

First—A permanent yearly appropriation, not to exceed \$25,000 for the improvement and conservation of the channels and banks by the use of a snag boat and crew on the Sacramento river, above the city of Sacramento.

Second—A specific appropriation of \$275,000 for the removal of obstructions in the lower Sacramento, and \$25,000 for the closure of Jacobs slough on the east bank of the Sacramento river, above the city of Sacramento.

Third—A specific appropriation of \$300,000 for the improvement of the Yuba river, near and above Marysville, and to retain the mining debris there.

Fourth—A specific annual appropriation of \$20,000 for the improvement of the navigable channel of the Feather river.

Fifth—An appropriation of \$136,750 for the San Joaquin river.

There should be no antagonism between this convention and that of the miners, which meets a few days later. The debris from the mines has undoubtedly injured the rivers in the past, but if present suggestions are carried out, this cannot occur again. Both bodies have demands in common; for the miners want the appropriations for the rivers, so that the lighter material which the dams will not hold back, can be oared for by the streams without doing any damage.

A Natural Sulphide of Gold.

The existence of gold in the form of a natural sulphide, in conjunction with pyrites, has often been advanced, theoretically, as a possible occurrence, but up to the present time this occurrence has, I believe, never been established as an actual fact. During my investigations on the ore of the Deep Creek mines, New South Wales, I have found in them what I believe to be gold existing as a natural sulphide. The description of this ore will, no doubt, be of interest to your readers.

The lode is a large, irregular one of pure arsenical pyrites, existing in a felsite dyke near the sea coast. Surrounding it on all sides are siliceous schists, and in the neighborhood is a large hill of granite about 800 feet high. In the lode and the rock immediately adjoining it are large quantities of pyrophyllite, and in some parts of the mine are deposits of this pure white translucent mineral, but in the ore itself it is a yellow and pale olive green color, and is never absent from the pyrites.

From the very first I was much struck with the exceedingly fine state of division in which the gold existed in the ore. After roasting and very carefully grinding down in an agate mortar, I have never been able to get any pieces of gold exceeding one-thousandth of an inch in diameter, and the greater quantity is very much finer than this. Careful dissolving of the pyrites and gangue so as to leave the gold intact failed to show particles of any larger diameter. As this was a very unusual experience in my investigations on many other kinds of pyrites, I was led further into the matter. Ultimately, after a number of experiments, there was nothing left but to test for gold as a sulphide.

Taking 200 grains of pyrites from a sample assaying 17 ounces of gold per ton, grinding it finely and heating for some hours with a solution of sodium sulphide (Na_2S_3), on decomposing the filtrate and treating it for gold, I got a result at the rate of 12 ounces gold per ton. This was repeated several times with the same result. This sample came from the lode at the 140-foot level, while samples from the higher levels, where the ore is more oxidized, although carrying the gold in the same degree of fineness, do not give as high a percentage of auriferous sulphide.

It would appear that all the gold in the pyrites (and I have never found any apart from it) has originally taken its place there as a sulphide. The following is an analysis of a general sample of the ore: Silica, 13.940%; alumina, 6.592%; lime, 0.9025%; sulphur, 16.584%; arsenic, 33.267%; iron, 27.720%; cobalt, 0.964%; nickel, traces; gold, 5 ozs. 3 dwts. 8 grs. per ton; silver, 16 dwts. per ton; total, 99.969%.—T. W. T. Atherton, in Eng. and Mining Jour.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING DEC. 29, 1891.

466,146.—BOW FOR STRINGED MUSICAL INSTRUMENTS—Ayres & Schroeder, Whipple, Barracks A. T.

466,214.—INSTRUMENT FOR MEASURING THE UNITS OF WORK DONE BY MACHINES—H. C. Behr, S. F.

466,014.—NUT LOCK—Brasaban, Richardson & Frischi, Suisun, Cal.

466,075.—WRAPPING MACHINE—W. A. Brown, S. F.

466,063.—ELECTRIC ANNUNCIATOR—F. C. Colville, Oakland, Cal.

465,974.—LOCK—H. Elliott, Los Angeles, Cal.

466,231.—VALVE FOR HYDRAULIC ELEVATORS—C. I. Hall, S. F.

465,861.—FIRE EXTINGUISHER—C. D. Harsin, Stockton, Cal.

465,929.—STEAM BOILER—A. Heberer, Alameda, Cal.

466,237.—MOTIVE ENGINE—J. L. He derson, Alameda, Cal.

466,073.—TRUCK—Hunt & Ball, Winters, Cal.

466,074.—MEMORIAL BURIAL TABLET—J. W. Hunt, Kirby, Or.

466,170.—METALLIC PACKING—Kilborn & Young, Oakland, Cal.

465,987.—CAR COUPLING—John C. Look, San Jose, Cal.

465,878.—DUMPING TRAP—C. D. Page, Tacoma, Wash.

466,256.—VINEYARD BRUSH BURNER—Jas. Porteous, Fresno, Cal.

465,979.—ORE CONCENTRATOR—G. E. Woodbury, S. F.

Notes.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

TRUCK.—Cbas. R. Hunt and Thos. D. Ball, S. F. No. 466,073. This is one of that class of appliances which are provided with mechanical power devices for facilitating the loading thereof. The invention consists, in connection with a vehicle, of an independent movable frame thereon and roller interposed which bear and travel on inclined planes, whereby, through the movement of the frame, it is lifted and lowered by the rollers. The object of the invention is to provide a simple, easily-operated and powerful means for lifting a load from a fixed stand on which it is preliminarily placed, and transferring it to and bearing it upon a vehicle by which it can be transported.

MEMORIAL BURIAL TABLET AND INDICATOR.—Johnathan W. Hunt, Kirby, Josephine Co., Oregon. No. 466,074. Dated Dec. 29, 1891. This relates to what the inventor terms a memorial burial-tablet, witness-pin or indicator, and receptacle. It consists of a tablet made of indestructible material, said tablet being buried beneath the soil of the grave, and in conjunction therewith of an indicator or pin, which shows the location of the tablet and at the same time serves to support a receptacle for flowers or other articles. The object of this device is to provide a suitable means for identifying any grave from which all external marks may have been destroyed, and as the tablet contains all the necessary inscriptions, and the pin points to its position, it will be easy at any time to identify the grave and know who has been buried in it.

VINEYARD BRUSH BURNER.—James Porteous, Fresno. No. 466,256. Dated Dec. 29, 1891. The implement is intended for the disposal of brush in vineyards. This brush, which consists in the numerous and extensive cuttings made every year, is somewhat difficult to dispose of, the usual method being to take it together in piles and either carry it off or burn it. It cannot be left on the ground as brush, because it is in the way of the cultivating implements. This new implement consists of a peculiarly formed furnace, mounted on wheels and made narrow enough to work easily in, and to travel through, the rows of vines. The brush is picked up and thrown into the furnace, and as it is burned up, the air holes below furnish ventilation, so that a thorough combustion takes place, and the same holes provide for a discharge of the ashes, which serve to enrich the ground. The novelty in the implement and the principle portion of its utility lie in the shape of the furnace. It is made with a wide top, so that the sticks thrown into it will not fall out. This is of great importance, not only in saving trouble in picking them up again, but more especially in preventing charred sticks from falling upon the ground. The furnace is made tapering, so as to remove its heated walls as far as possible from the vines. When burning brush openly between the rows, it is the practice to protect the vines by covering them; but with this device, this is unnecessary.

WRAPPING MACHINE.—Wm. A. Brown, S. F., assignor of one-half to Arthur G. Towne. No. 466,075. Dated Dec. 29, 1891. This invention relates to that class of machines for wrapping parcels of all kinds, and especially for wrapping packages of bags. The object of the invention is to provide a simple and effective machine for tightly compressing the parcel within the partially-surrounding wrapper, until said wrapper is properly pasted or otherwise secured, and then relieving said wrapped parcel.

TO CLEAN GOLD JEWELRY make a lather of plain yellow soap and tepid water, and wash the ornaments in it; dry them thoroughly, and afterward brush them with a little dry whiting, finally polishing them with a very soft leather.

UTILIZING WATER POWER.—The Pelton Water Wheel Co have recently issued a new edition of their catalogue, which embraces a vast amount of tabular and descriptive matter relating to the means of utilizing water powers by the Pelton system, making quite the most valuable contribution to modern hydraulic literature that is now available. Much attention is given to the generation of power for electric transmission, which is now the absorbing question in electrical science. The system here described makes possible the utilization of this source of energy under a wide range of conditions and with a degree of economy, simplicity and efficiency never before attained. Engineers, as well as parties interested in the development of water powers, will be furnished a copy upon application to the Pelton Water Wheel Co., 121-123 Main St., San Francisco.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Educational.

A. Auchie Cunningham, F. C. S. & C. ANALYTICAL AND CONSULTING CHEMIST,

14 Chronicle Building, San Francisco.

Prof. of Chemistry Hahnemann Hospital College, S. F. Evening Classes in Theoretical and Practical Chemistry. Instruction also given by mail. Terms on application.

JOHN T. EVANS, Assay Office and Chemical Laboratory. ROOMS 46 AND 47 MONTGOMERY BLOCK, 628 S. Montgomery Street, San Francisco. For nearly 15 years with Thomas Price, as Chief of the Ore-Assay and Analytical Department. Lessons given in Assaying and Chemistry.

School of Practical, Civil, Mechanical, Electrical and Mining Engineering, Surveying, Architecture, Drawing and Assaying, 723 MARKET ST., SAN FRANCISCO, CAL. Open all year.

A. VAN DER NAILLEN, President. Assaying of Ores, \$25; Bullion and Chlorination Assay, \$25; Blowpipe Assay, \$10. Full Course of Assaying, \$50. ESTABLISHED 1894. Send for Circular.

HEALD'S BUSINESS COLLEGE, 24 POST ST., S. F.

FOR SEVENTY-FIVE DOLLARS THIS College instructs in Shorthand, Type Writing, Book-keeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business for six full months. We have sixteen teachers, and give individual instruction to all our pupils. Our school has its graduates in every part of the State.

SEND FOR CIRCULAR. E. P. HEALD, President. C. S. HALEY, Secretary.

AMERICAN MINING AND STOCK CODE "KELLOGGRAPH."

Indispensable to the Mining Profession and Useful in all Business Transactions.

A Complete System of Transmitting Telegraphic Messages by Code Cipher Words in a Legible, Secret and Economic Manner.

OVER 35,000 WORDS AND SENTENCES Subject to transmission under infinite complication by the use of over 70,000 code words.

No danger of publicity in telegraphing matters concerning operation or sale of mining property. The work strictly alphabetical and classified. The handiest work ever published for mining operators.

PRICE, \$5. Forwarded postpaid on receipt of price by DEWEY & CO.

220 MARKET STREET, SAN FRANCISCO.

HORACE D. RANLETT, Ores, Mining, and Commission, 420 Montgomery St., S. F.

Ships under advances to smelting works in Boston New York, Baltimore and Liverpool. Twenty-one years' experience in Shipping Ores and Managing Mines. Solicits Covenancements of Copper Produce and Management of Mining Matters. All business conducted on Cash Basis. Purchase and shipment of Mining Supplies a SPECIALTY. Sales of Developed Copper Mines undertaken. Business Manager of UNION COPPER MINE, Copperopolis, Cal.; NEWTON COPPER MINE, Amador Co., Cal.

MINING AND SCIENTIFIC PRESS. The Leading Mining Journal in America. Established 1860. Latest Discoveries in Science and Improvements in Mining and Mechanical Arts Illustrated or Described. A Standard Illustrated Weekly published at \$3 a year by DEWEY & CO., 220 Market St., San Francisco, Cal.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

DESIRABLE LAND

—AT— AUCTION! NEAR TULARE, CALIFORNIA.

BEST CHANCE NOW OFFERED.

All in the Wonderful Artesian Belt or New Tulare Irrigation District.

Within one mile (southwesterly) of Tulare City limits, 160 acres. Will be sold as a whole or in five-acre homestead (or villa) lots.

Seven miles southwest of Tulare, 480 acres, principally good for grain, alfalfa, vineyard, fruit, nuts, etc.

A good, flowing, never-failing artesian well of clear, healthful water; large reservoir; two-story, eight-room, well built house; large barn and other convenient buildings; several acres of orchard and of alfalfa.

Will sell as a whole or in lots to suit. Title perfect. All surrounded and subdivided with wire fences. Residence has a garden, shrubbery and plenty of shade trees attached to it. Terms, one-fourth cash and balance in easy payments to suit purchaser.

Also, 160 acres less than two miles south of the 480 acres, of equally good but unimproved land, bound also to be greatly advanced in price.

Examine this land and improvements and be ready to bid it off at a bargain.

Auction in Tulare City, Saturday, Feb. 27, 1892. Place and hour of sale to be announced later.

Write or call on E. M. DEWEY, Tulare City, or A. T. DEWEY, No. 12 Front St., S. F.

IMPORTERS AND DEALERS IN

ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,

ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.

63 & 65 First St., cor. Mission, San Francisco

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balance, Furnaces, Muffles, Crucibles, Scofflers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies also the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.

Agents for the Morgan Crucible Co., Battersea, England. Also for E. G. Denniston's Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.

MARSHUTZ & CANTRELL, Sole Manufacturers.

Send for Circulars and Price List.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

Manufactured under Patents of April 27, 1880;

September 18, 1883; July 24, 1888;

and March 31, 1891.

Price of Plain Belt Frue Vanner, \$575, f. o. b.

Price of Improved Belt Frue Vanner, \$825, f. o. b.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - \$650 f. o. b.

Price "Triumph" Concentrators, with Plain Belt - - - \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,

39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1886.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices.

Signed] Sup't North Star and Original Empire Mining Co.
N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

Was Awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891.

More than Double the Capacity
With One-Half Less Power and Occupying Less than
One-Half the Space of any other Concentrator.

Built of Best Steel and Wrought Iron.
STRONG AND DURABLE.

Price.....\$575 f. o. b.
Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. This excess in length of material effectually prevents the edges from cracking; plain edge belts have to stretch about one inch to the foot as they pass around the drums. This continuous stretch cracks the edges. The improved belt obviates that difficulty.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Concentrating Belt manufactured in San Francisco; we can therefore fill all orders on short notice. The length and width of these belts are the same as is used on the Frue or Triumph Concentrating Machines, but can be made of any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight ruffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight ruffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

F. A. HUNTINGTON,

— MANUFACTURER AND DEALER IN —

MINING MACHINERY.

HUNTINGTON'S IMPROVED ROCK-BREAKER.

The Main Features of this Machine are Strength, Ease of Adjustment, and Simplicity of Construction.

The movable jaw A is worked by the eccentric B and is pivoted at the bottom. The stationary jaw D is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt C. The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt C and the jaw D. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.

HUNTINGTON'S PATENT ORE FEEDER.

This Feeder is especially designed to feed the Huntington Roller Quartz Mills; it is simple in construction, and while in motion can be easily adjusted to feed fast or slow; it has but few wearing parts and its positive movement makes it the best Ore Feeder now in use.

F. A. HUNTINGTON'S CENTRIFUGAL ROLLER QUARTZ MILL.

The Following will Explain the Above Cut:

The ore and water being fed into the mill at the hopper A, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet-crushing and gold-saving it has no equal.

I CLAIM ESPECIAL MERIT IN THAT FEATURE OF THIS SYSTEM WHICH PREVENTS ALL FLOURING OF GOLD AND QUICKSILVER, and the consequent loss of gold that attends stamp-milling.

For the economical working of ore that contains sulphurets, I particularly claim the adaption of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

F. A. HUNTINGTON'S PATENT SHINGLE MACHINE.

This machine is so well and favorably known by all the principal lumbermen on the Pacific Coast that it is useless to go into any detailed account of its merits; suffice it to say that recent improvements in a new, quick return feed-works has placed it far ahead of all competitors. Send for Circulars.

Three Dollars per Annum.
SINGLE COPIES, 10 CENTS.

The Best Duplex Vapor or Gas Engine.

The accompanying cut represents a duplex gas or gasoline engine manufactured by Daniel Best of San Leandro, the noted builder of traction engines, steam harvesters, etc. Mr. Best exhibited a single cylinder engine of this type at our late State Fair, and also at the Stockton Fair, and after a very careful Prony brake and gas meter test, was awarded the first premium. An engine like the one shown in the cut is now doing work on a "motor car" on the San Jose and Alum Rock street railway. The cylinders of these engines are 8"x16", and when the engines are running 300 revolutions per minute, are claimed to develop about 18-horse power. This motor car has made 14 miles per hour, hauling a loaded gravel car both ways over the line, which is some four miles long. A six days' test of the motor car shows a consumption of about six gallons of gasoline per day of ten hours, when the car is running at an average speed of eight miles per hour, and about ten gallons per day, when the speed is increased to 14 miles per hour. To keep the engines cool, about 60 gallons of water are required. This water is stored in a tank on top of the car, and there is a loss by evaporation of about five gallons per day.

This may seem a strange statement to those not acquainted with the construction of the engine; but the electrical sparking device, which ignites the explosive gases in the cylinders, is so constructed that it is not injured by even a very high degree of heat, and the high efficiency of the engine is perhaps due to this fact, for it is well known that if the cylinder of a gas engine can be safely kept at a reasonably high temperature, the explosive gases confined therein will exert a greater force when exploded than they would if cold. Mr. Best, in fact,

SYSTEM OF MULTIPLE NOZZLES FOR WATER-WHEELS.—See page 42.

BEST'S DUPLEX GAS ENGINE FOR "MOTOR-CARS."

claims this as one of the many strong points in his engine.

The speed of these engines is controlled by simple ball governors, which operate the sparking device. The explosions take place in the cylinders whenever the motion falls below the given number of revolutions desired—the range of the governors being from 150 to 300 revolutions per minute.

In running the "motor car" at San Jose, the engine is stopped on down grades and the cars run by gravity. When the car reaches the foot of the grade and begins to slow down, one or both of the engines are brought into action as may be required, and this by the movement of a lever while the car is running at full speed. The car will run backward or forward and is under as perfect control as a steam locomotive.

What the result of this new departure in motor cars will be, can easily be conceived. The gas or vapor engine has apparently come to stay, and is being used to propel pleasure boats and larger craft for commercial purposes. Numbers are employed in running printing presses, machinery, pumping water, etc. The successful application of the gas engine to urban and street railway work will largely assist in doing away with the use of animal power now so generally used. These engines require no skilled engineers to run them and are comparatively inexpensive to operate. Mr. Best, having made such a success of his traction engines and steam harvesters, is a good man to enter this new field of mechanical engineering.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Rehabilitate the Mining Industry.

A Plea for the Hydraulic Miner.

SAN FRANCISCO, Jan. 9, 1892.

TO THE EDITOR:—I want to say through your columns, to the miners of the State of California, that the time for action has come; let not your interests lie dormant any longer, but at once endeavor to redeem your former prestige, and bring to the front once more the leading industry of the State. Show the world that instead of our gold fields being exhausted (as many claim), that there is yet more gold in the ground yet than has ever been extracted. What is needed now, is to have the question settled as to the proper method of its extraction, without materially injuring other interests.

There have been so many bitter attacks made upon the miners of this State, on account of the filling of our water courses by debris, that it seems to be taken for granted that this filling is due entirely to the operations of the miners. The Anti-Hydraulic organs talk about land being destroyed by debris, and that no convulsion of nature could so destroy its usefulness, while the opposite view is maintained by those who have the proper facilities of knowing.

Take for instance the Cherokee Mining Co., which bought 28,000 acres of ground below its claims to be used as dumping grounds; the right to do which was denied the company on the ground that "the title to land does not carry with it the right to destroy the productive quality of the land."

The Cherokee Co. purchased land on Dry Creek, which was covered with debris, but now some of that land has been reclaimed and is now cultivated and producing good crops of wheat, equal to any in the adobe soil. From this it would appear that the land was not permanently ruined by silts, but after two or three years rest it becomes assimilated with the original soil and again becomes good farming land. In proof of this, a number of acres of this land was sown in wheat, which produced no less than 80 bushels to the acre. It is true lands are covered, levees have had to be built, and improvements have been destroyed. But the land so covered, again makes good and productive soil.

Is not the right to mine as well established as the right to farm? The miner must wash his ground; the farmer must plow his fields. Both are secured in their rights by custom and necessity, yet neither of them is by statutory laws. Now as to any written statute for the prevention of hydraulic mining there is none whatever, neither State nor United States.

The miner bought his land from the government of the United States and paid therefore at the rate of \$2.50 per acre. The farmer buys his at the rate of \$1.25 per acre. Now the question arises what does each party purchase the land for, if not for its respective use? Hydraulic mining is a legitimate and honorable industry, of great benefit to the State at large and upon which whole towns and thousands of workmen and their families depend for support, and it is unjust to crush it by injunctions issued by interested parties.

It not infrequently happens that private rights must give way to the public good, and it is a matter of fact that is indisputable that the sum of \$200,000,000 has been expended in this State by mining men and capitalists in the advancement of the industry they represent, in the purchase of lands, bringing in ditches (costing millions of dollars), and machinery to develop the golden resources of the State. All of this is now a dead loss, aside from the outlay of an annual output of from \$12,000,000 to \$15,000,000. It is enough to paralyze and bankrupt a nation, let alone a State.

Since the stoppage of hydraulic mining there have been thousands of men thrown out of employment and their homes and families made desolate and destitute. The interior towns have deteriorated in population, and lost all their trade, where once they did a large business in supplies for the mines; while the mining towns that contained from 500 to 3000 inhabitants, now in many cases, have been utterly wiped out.

What made this great and glorious State? What brought out our pioneers? Was it not the gold that all expected to realize? Has all the latter farming interests brought hither the same class of hardy, daring, self-reliant, brawny-armed men?

What has built up this great metropolis of the Pacific, and built our city from amid a barren sand waste? Look at every large and substantial structure of the times up to 1880 and the record will show that the investments were made almost entirely by those who had realized from the mines, even with all our great wheat products.

No damage has yet been done to San Francisco bay by mining operations, nor is there any possibility of its ever being done. Its great distance from the mines, an immense level plain intervening, renders it impossible for the detritus to be carried there but in solution. The destruction of the navigable rivers from hydraulic mining is also impossible. This industry does not increase the flow of water; on the contrary, it stores it during the flood season,

and adds materially to the flow at low water when it is most needed.

While on this subject, allow me to refer to the Congressional Committee which came out here to investigate the subject some years ago, when some of these Solons were made to believe that the black mud at Mare Island, in which the "Independence" was imbedded, was the result of silts from the mines, which would have to run up stream to get there. Now, any one knows that all mining debris is of a silicate nature instead of soil—or black mud.

By reference to the report of the State Engineer, Mr. Hall, made in 1880, we find that the Sacramento river transports each year about 18,000,000 cubic yards of earthy material, of which 13,200,000 yards come from the mines; the residue of 4,900,000 yards coming from other sources, resulting chiefly from agricultural disturbance of the soil. That is to say, farming operations are responsible for over 25 per cent of the present damage.

Able engineers believe fully in remedial measures, and their opinion is of great weight. If the calculations of engineers were true, the whole gravel grounds could be put in the Sacramento valley and it would not fill it two inches higher. From Marysville to Suisun bay is a distance of about 80 miles; assuming an average width of 40 miles, we have an area of 3200 square miles. To fill this area one foot in depth by the flow of mining debris would require 250 years of time.

Could the swamp lands along the Sacramento river be filled with this debris from five to ten feet in depth, thus building up firm and high ground, there would be ample room for all the material which may ever come from our mines.

A dam now stands across Bear river, near Colfax. It has stood the test for years and no flood can remove it.

A plan whereby the lighter portion of the washings from the mines could be brought down by means of flumes and deposited upon the tule lands of the water courses, and not only pay the cost of construction, but also reclaim millions of acres of land now and forever worthless, is thoroughly practical. It is only a question of means. The end is protection to the farmer and immunity to the miner. It is unjust to expect the miner of to-day to take care of the tailings of the early miner. The whole world has been enriched by his work, and it is not the duty of the Government to make a small expenditure to avert the injury resulting from it? Make the showing, and there will be no difficulty in getting the aid. Waste no more money and effort in a suicidal war on your friends. Unite with them for the common good. The only sensible course now is conciliation and compromise. If both sides will agree upon a system of damming and reclamation, Congress may be induced to aid in the clearing out or leveeing of the rivers. Otherwise, we need not expect much help from that quarter, and the game of outting each other's throat and liberally feeling the lawyers will go on. Had not this agitation been sprung originally by a legal light of the profession, for the purpose of his own pecuniary aggrandizement, the question would have been amicably and satisfactorily adjusted long since.

Gold regulates the commerce of the world and controls the destinies of nations. Had it not been for California's gold in the late struggles of our own nation, where would we have been? And now, in presenting our grievances to the Government and asking aid to help solve this question of the mining interests and output of the precious metal, we are merely asking a small favor in return for the one given in time of need.

And here let me add that in Judge Temple's decision, rendered in June, 1882, in the Dotch Flat case, the following passage occurs: "Subject, nevertheless, to this, that said defendants may at any time, as it shall be advised, apply to this court to have this decree and restraining order modified or vacated and set aside. And whenever, upon such showing, it shall appear that efficient means have been provided to impound, detain and hold back said tailings at any point on said American river above Alder creek, and that such means are sufficient to detain all boulders, cobblestones, gravel and the heavier sand, then said defendant shall be entitled to have said decree vacated and set aside."

His opinion is as follows: "I have concluded to so find that when the heavier debris is completely impounded mining may be resumed, virtually refusing to hold that the plaintiff may enjoin such operations as only corrupt the water with mud and render it less suitable for domestic and other uses. Perhaps I am somewhat moved to this by the consideration that otherwise mining can never be prosecuted at all. It will probably be impracticable to impound the lighter portion of the sediment. I confess I shrink from a consequence so far-reaching. It seems to be a conceded fact that this is not materially injurious either to navigation or the riparian lands. Counsel denied that there was any intention to assail the prosecution of drift, seam or quartz mining. There was no material injury from that source. The sediment from such mines is of the same character as the material which cannot be wholly impounded."

Therefore, I repeat that there is no legal statute upon the books to prevent hydraulic or any other species of mining.

"It is the duty of every citizen to lend his influence to consummate the desired end" in a fair and reasonable manner, which shall be just to both parties, and not by popular clamor, misrepresentation or snap judgment.

The only injunction that should be considered in the premises is the divine injunction, "Do unto others as you would have them do unto you." What is needed is joint action toward procuring Government aid in solving the problem, so that the hidden wealth of the hills may be taken out, and at the same time every foot of valley land may be saved or reclaimed for agricultural purposes.

In conclusion I would add, let us see every honorable means in our power to have this vital and most important question of the reopening of mines, brought to a speedy and at the same time, equitable, adjustment, restoring us to prosperity in all branches of industry, and adding millions annually to the nation's wealth; giving a new impetus to trade and commerce and furnishing to the world additional wealth, which otherwise must remain in nature's laboratory for all time, benefiting no one.

W. AUG. KNAPP.

Those Absurd Department Rulings.

LINCOLN, N. M., Jan. 2d, 1892.

TO THE EDITOR:—I note in your issue of the 26th ult., an editorial upon Mr. Asst. S. O. Chandler's decision in the case of Hay et al. vs. Kern et al., Sacramento Land District, Cal.

I am glad to note the growing disposition to contest in Congress the absurd and alarming rulings of the Department in relation to mineral lands and claims. As you very justly remark, Mr. Chandler has precedents (and a long line of them) for his decision but all of these decisions of himself and predecessors in office, are based upon profound ignorance of law, or upon bases still less creditable.

An experience of many years, in mineral practice before the local Land Office and the Department, has deprived me of the capacity of being surprised at any absurdity which the Department of the Interior and its officials may commit, and they habitually disregard Department precedents even, whenever by so doing they may oppress the mineral or coal claimant.

By the miners in various departments of that business, the West has been developed. True, California has a great reputation now, as an agricultural and horticultural State. Nevertheless, but for her stores of gold, and the gallant men who made them available, her agricultural and horticultural development would now have hardly been commenced, and the second half of the twentieth century would hardly have found the State where she is today. The same may be said of Colorado, N. M.; A. T. Utah, Nev., Montana and Idaho. But for the miners, the farmers in this region would have no available markets, and the lands would lie waste and unoccupied. In every other mining country, the miner is encouraged and receives in every practicable way, Government aid. In the United States alone, in the country which more than any other, is indebted to the mining fraternity, is the miner regarded by the petty officials of the Government as under a ban, and mining as an interest to be discouraged, by the interposition of every obstacle in their power to create.

I know very many cases of contest between agricultural claimants on the one hand and mining or coal claimants on the other, in which the land has been given to the agricultural claimant notwithstanding unquestioned proof that the land was prospectively valuable for mineral or coal, and that it was utterly worthless for agricultural purpose. I have known this to be the result even when it was in evidence that the agricultural (?) claimant had laid out the land in town lots, and only sought title for purely speculative purposes.

All familiar with the intentions of Congress in passing the mining statutes, know that such intentions were directly opposite to the practice of the Interior Department.

It is time that Congress made a declaration unmistakable in its terms, which shall bring these officials to their knees. And while about it, Congress should provide that under no circumstances shall officials of the Interior Department, take jurisdiction over contests initiated after final proof and sale of the land, as evidenced by a certificate of purchase. From that date the United States has no beneficial interest in the land, and holds nothing but the dry, naked legal title in trust for the purchaser. And yet the land of thousands has been stolen from them by the decisions of Interior Department officials, after sale of the land and the receipt by the United States of the price. If any mistake has been made, or fraud committed in the premises, the courts are open to the United States or to any one having in equity a claim upon the land, and to the courts they should be referred. At least the courts alone have any lawful jurisdiction in the premises. Our people should be far more jealous than they are of the jurisdiction assumed by departments of the Government, and especially by the Department of the Interior, to control the operation of positive law by the operation of so-called "regulations." As often exercised, it amounts to tyranny pure and simple, and may always become so. It is safe to say that no other Anglo-Saxon people would endure this most despotic jurisdiction for a moment.

Positive law is overridden; and the decisions of the Federal courts are disregarded, with an insolent assumption and a "what are you going to do about it?" air, as irritating as injurious. It is full time these departmental violations of law should cease, and the officials of the Department be taught their places. The question involved in your editorial is a good one to

begin on. It is a question affecting the entire West. The whole western mining region can be united on that and other questions of pressing importance to us. If our present representatives in Congress will not carry out our wishes, we can elect men who will. And we can cause it to be understood that no party can command our support, which will not obey our will in these matters; on the eve of a Presidential campaign is a good time to begin. I am a Republican of somewhat radical record, but I, for one, am willing to subordinate partisan preferences to real interests, and to unite in aiding to the party managers that further support is dependent upon prompt and full compliance with the reasonable demands of the mining regions in this and other respects.

* * *

How to Build a Dam.

The chief cause of failure in dams of all kinds is the faulty construction of the foundation, says the *Denver Field and Farm*. Just as a house will fall by reason of a weak foundation, which may be crushed under the weight of the walls, so a dam gives way by the gradual loosening of the foundation, caused by the flow of water through leaks. Earth dams above three feet high are sure to be washed away at some time, if they do not sink gradually by the certain percolation of water through the bottom. The weight of a bulk of water three times as large as a rock will move the rock bodily, as if it were wood, and the difference of specific gravity is overcome by the height of the water over the heavier obstacle. A very small torrent will roll large boulders along its course with ease, and this enormous force of water must always be provided for in all hydraulic work. Dams should be made of timber or stone. For a safe and simple form of timber dam, the foundation should be rock or hardpan of gravel, and the mudells on the lower tier should be heeded in broken rock, pounded down firmly with a 15-pound sledge. The sills are saddled, and the cross-ties laid upon them are notched to rest upon the saddles, and two-inch pins should be put through both of the logs. Where the foundation is shelving rock, 1½-inch iron pins should be put down into the rock at least a foot, to prevent sliding. But the sliding force is almost neutralized in this form of dam by the weight of water, which lies upon the sheeting. The tiers of timber are built up and saddled, and notched. A plank sheeting is put down to the solid foundation above the first sill, and is spiked with eight-penny spikes firmly. The sheeting is filled to the foundation as close as possible, and hydraulic cement concrete is heeded in front of it, to make a tight joint. No leaks will ever trouble a dam founded in this way. The rafters should be strong enough to bear any weight of water which the stream may carry doubled. If the highest flood known is five or ten feet above the usual level, it is easy to estimate the strength of the rafter required, and then double the number of them, putting them no more than two feet apart, if the sheeting is of one-inch board doubled. If any error is made, it is the cheapest to err upon the safe side, as the cost of more material will be much less than that of a new dam, and perhaps a mill that may go with it. An apron should be put in front of the dam, to receive the overflow; this throws the weight of the water on the face of the dam, and balances so much of the pressure on the upper sides. An earth dam may be made safe by sheet piling driven to rock or hardpan or clay, in the center of the excavation. A dam should never be built on surface soil, but the center should be placed on solid ground. As the earth is put in, it should be well packed by driving oxen or horses back and forth, or by ramming it well. This prevents settlement when the water is let in above it. The ends of an earth dam should be protected with sheet piling at least two feet higher than the overflow at the center, and the overflow should pass over solid plank flooring, spiked to timbers well heeded down on the top and both sides of the dam. This will prevent washing of the top. A masonry dam should be built on a foundation of concrete, laid on solid rock, over piles driven close together, and both sides protected by sheet piling. The piles should be left to protrude into the concrete foundation. Except for water works, there should be no outlet in the bottom of the dam; but the work should be of the most solid character. A waste channel for overflow should be made on the top large enough to carry off any possible flood, and the ends of the dam should be carried up with solid masonry as high as may ever be needed to prevent outflow of the ends by the flood. A large dam should be constructed regardless of expense to secure safety in every direction, and the small details of construction are very often the most important parts of the work. Any person who might, under any circumstances, build a masonry dam in hollow shell form, and fill it with dirt, or leave earth banks on either side of the dam, should be confined in an asylum for imbecility. No doubt, considering the vast importance of securing unquestionable safety to the unsuspecting public whose lives may be endangered, all persons practicing as hydraulic engineers should be licensed only after exhaustive examination by competent men. If a veterinary surgeon or a physician—who could scarcely kill a hundred persons by the mistakes of a lifetime—must be properly licensed before he can practice, how much more should an engineer be, upon whose

TERRACING—AN INTERESTING PHASE IN THE DEVELOPMENT OF THE FOOTHILL REGION OF CALIFORNIA.

mistakes thousands of lives may impend? Every sensible man is convinced that a dam, like any other engineering work, must be built in accordance with the principles of construction. It is easy to figure exactly the force which a dam may ever be called upon to resist, and manage the construction in such a way as to provide an excess of strength and permanence, and we give it herewith.

Terracing in the Foothills.

There is a strip of country on the east and north of the San Joaquin and Sacramento valleys, that extends their entire length, known as the "thermal belt." It lies in the first foothill lands that rise out of the valleys and is only a few miles in width. There is less frost here than in the valleys; and above, the cold steadily increases until the summit of the Sierras is reached. In this region a great variety of fruit can be grown of superior quality.

Many of the hillsides, however, are too steep to be planted to orchards in the ordinary manner, but during the last few years some of them have been terraced and planted to oranges and early peaches with results that are highly satisfactory. Both the fruit require abundant water, but the land on which the trees are grown must have perfect drainage. They will then produce fruit large in size, and in great quantity, and it will ripen earlier than where less water can be used, as I have noticed for some years the finest fruit and the first to ripen was always from trees that stood near water ditches on hillsides. The ground thrown over in terracing gives depth of loosened soil that makes a rapid and healthy growth of tree and fruit, that it is thought fully compensates for the cost of the work. The terracing gives picturesque beauty to the country, of the high-

est order known to practical horticulture, thereby creating a value beyond intrinsic comparison. Newcastle, with an altitude of 1356 feet, is in a direct line 6 miles northeast from Rocklin—altitude 249 feet. Loomis and Penryn being between the two places, and all on the line of the Central Pacific Railroad, the land rising at the rate of over 100 feet to the mile. Sacramento can be seen from each of these towns and is distant from Rocklin 22 miles.

A ridge of land beginning at Newcastle runs west some two or three miles when it curves toward the south for several miles, abruptly terminating west of Rocklin, and very near the town. A large portion of the land lying north and west of Rocklin, Loomis and Penryn, between the top of the ridge and the railroad, belongs to the individual members of the Placer County Citrus Colony. The sides of this ridge are being terraced by their owners and planted to oranges, from plans made by me, and the work in part has been done under my supervision. In the spring of 1888 the work was begun on a spur of land projecting from the ridge, containing 10 acres. This lies west from Penryn two and a half miles, northwest from Loomis equally distant, and in plain view from either place. Near the base of this hill, and at the point of central approach, is a cottage house, neatly built of split granite, that is now being used as a club house, for the Colony Club. Beginning just below this house I built a zigzag avenue up the centre of the spur to the top, on a regular grade of twenty inches to the rod. This makes an easy carriage road, the steepness of the hill being overcome by the continuous curving. After the terraces were made I paved the gutters on the upper sides of the avenue, changing to the opposite side at each curve. Pipes were laid across the road as the gutter changed sides, four inch pipe being used on the upper turn, increasing to eight inch pipe at the lower crossing, as in a rainfall the water is greater in quantity at the base than at the top of the terraces. From the highest part of this spur that was to be planted I began the terraces on each side of the avenue, the first being only a few rods in length, increasing with each ter-

race until the base was reached. The terraces terminate at the side of the avenue and have a grade of two and a half inches to the rod for the running of water in irrigating. The terrace step was made level with a bank slope of 45 degrees, varying according to the steepness of the hillside. The width of the terraces as measured on the slope, was about 25 feet on an average, but only from 12 to 20 feet was the width of the level part. Sidehill plows were used in making the terraces, and they were run back and forth until the work was nearly done, when it was finished with shovels, some dirt having to be taken from high points to low places in wheelbarrows. Recent experience, however, has made me familiar with an implement called a "V" which, following the plow does the leveling much more cheaply. This implement should be made especially for this work, which I cannot describe in this article. The trees were planted 18 feet apart in the row, and near the edge of the terrace, that they might stand centrally over the greatest depth of loosened soil.

Orange trees in this section should be planted in March, that they may become well rooted before summer, when the heat is liable to check their growth if planted late. Since planting this orchard I have been nearly all the time in Southern California, and have frequently visited the orchards of Riverside, Pomona and Redlands, and I find the trees on these terraces are as large, as vigorous, as healthy, and as uniform in size, as any in the favored sections of the south, that are of the same age and were of the same size when planted.

Among the visitors to this orchard when first planted were some English gentlemen. They were so impressed with the picturesque beauty of the place, and the surrounding country, that they purchased land adjoining, and in the spring of 1890 began to terrace and plant the hillside south of the terrace planted in 1888. Continuing last spring, they now have nearly one mile in length of the hill slope terraced and planted, and many more acres are to be planted in the neighborhood during the coming season. These terraces are irrigated by several lines of pipes laid from the top running

down the face of the hill to the bottom. The distance between these lines of pipe is 330 feet. The pipes are laid under the ground, with faucets attached and coming to the surface, just at the base of each bank. Each terrace can thus be supplied with water by the opening of a faucet, and the trees can be irrigated for a distance of 330 feet, when another line of pipe is reached, this continuing along the entire length of the orchard. Near the center of this planted tract is an avenue that runs diagonally over the face of the ridge to Clover Valley. I have made a paved gutter on the upper side of this avenue, into which runs all surplus water when irrigating, and all that may accumulate on the terraces from heavy rains. A deep furrow is plowed at the base of each terrace to conduct this water to the gutter.

Many Englishmen have already located here, some of whom are gentlemen of abundant means, who have brought their families, have built substantial houses, and have come to stay. Others have purchased land which they are having improved, and will come themselves as soon as they can arrange to leave their present callings. With their national thrift, they prefer to have their country homes where a good income can be derived from their investment, rather than have their country residences in some suburban town of San Francisco, where no income is ever expected, as in the Oakland or Santa Cruz highlands that overlook the towns, as the foothills here overlook the valley and the Capital City of Sacramento.

These terraces as they lie on the face of the curving ridge that encircles the sloping valley, are like "pictures hanging on the wall" to travelers on the O. P. R. R. as they pass through the towns of Penryn, Loomis and Rocklin, and to the people who live in the vicinity they are a constant source of pleasure. When the face of this ridge from the Newcastle line to Rocklin becomes converted into terraced orange orchards, as the owners purpose doing in a few years; and when the trees attain good size, and come into bearing, they will present scenes of unique beauty unequalled by anything similar in the country.—P. W. Butler in Rural Press.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Calaveras.

NEW ENTERPRISE.—*Mt. Echo*, Jan. 9: The Utica Mining Co. has in course of construction an immense structure, 85,000 feet. It is situated on Angels creek, near the Tulloch mine and about a half mile below tows. This building is being erected, as we understand, for the purpose of catching the sulphurets unavoidably escaping from the mill. A large flume is being built from the Utica mill to the structure before-mentioned, a portion of which will be copper-plated with a view to saving the fine amalgam and quicksilver spray that cannot be saved by the first process. This is a gigantic undertaking and will necessitate large expenditures. Nevertheless, there is little doubt that the enterprise will prove a paying one.

El Dorado.

STRUCK A CHANNEL.—*Cor. Call*, Jan. 18: Monday evening of last week, Holmes & Gichel struck a channel in their mining claim about half a mile north of Georgetown, from which they took out \$8 to the pan. The next day they took out, besides smaller pieces, one "nugget" which weighed over 55 ounces of pure gold. Their "good luck" continues, rewarding them with a daily yield of \$600 to \$1200, and the end is not yet. This claim adjoins what is known as the "Van mine," owned by a Mrs. Baldwin and Mr. Garrett of San Francisco, who are just starting up their mill, with prospects of good success.

Mono.

BODIE MANAGEMENT.—*Bodie Miner*, Jan. 1: In a recent issue of the MINING AND SCIENTIFIC PRESS, a statement appeared to the effect that they were in receipt of a letter saying that the "management of the Hale & Norcross would pale beside that of the Bulwer, Bodie and Mono." To people living here in Bodie who are in a position to be informed in regard to the management of these mines, a reply of any kind would seem entirely unnecessary, but as the stock in these mines is held by persons scattered over different parts of the United States, we will say that if the paper referred to has such a letter in its possession, the writer is either a fool or a knave. We know from personal knowledge that the management under Supt. John W. Kelly has been characterized by ability, honesty and economy. That the mines are not dividend-paying is not his fault. All that an intelligent and skillful management could do to make them more productive has been done, and from all indications we believe that Mr. Kelly's efforts will be crowned with success, as the Bulwer has commenced shipping ore and a 15-inch ledge of good milling ore has been discovered in the Bodie.

HOMER MINING DISTRICT.—*Bodie Miner*, Jan. 1: The past year has witnessed more substantial and systematic work in this district than done at any other time since its discovery. We claim this for Homer district: It has a greater number of claims showing good prospects than any other district in the world; and it has a mine which is producing more bullion each week for the amount of ore crushed than any other mine in the country. We refer to the Lakeview. Ever since they started up the two-stamp mill last spring, the lowest production of bullion per week has been \$1300, and the highest \$5000. If there is another mine that can make as good a showing, we should like to hear of it. The Lakeview is owned by Eastern capitalists, who, for several years, have been paying out considerable money for assessment work, etc. Last June, one of the company, Col. C. A. Dyer, came out from Maine to see what they had in the way of a mine. After a thorough examination of the property, he was more than satisfied, and was well pleased with the work done by Supt. Pierce. Col. Dyer remained here, and proceeded in a manner which showed that he was the right man in the right place. Many things had to be done and many obstacles overcome, and that in a short time, to thoroughly equip the mine. Roads had to be made, a mill bought and put up, and 2000 feet of tramway built. All of this has been accomplished already, with the exception of putting together all of the mill machinery, and that is being done as fast as circumstances will permit. Within a short time, the company will have the ten-stamp mill in operation. Careful estimates of the value of the ore in sight have been made by competent persons, and they place it at upward of \$2,000,000. A winze is now being sunk on the west vein, and the ledge increases in width and improves in quality as depth is attained.

THE BODIE MINES.—*Bodie Miner*, Jan. 9: The Standard continues to make regular shipments of bullion. Within three months two dividends of ten cents each have been declared, and there is every reason to believe that there will be several more this year. The Syndicate, Bechtel and Bodie tunnel is leased by Sam Tyack and J. F. Parr, who employ quite a number of men altogether. During the year they have taken out a large quantity of ore that has paid them well. The Bulwer is now supplying the Bodie mill with ore and will probably continue doing so for an indefinite period. It is well known that there is in the mine a large quantity of low-grade ore, and it is now reported on the streets that some very rich stringers have been discovered, and the low grade in connection with these can be worked very profitably. The Bodie and Mono are being prospected in a thorough and systematic manner, and from the late reports of the superintendent it looks as if his efforts would soon be rewarded. The Summit, we consider one of the most promising in the district and feel confident that a year from now it will be employing more men than any other mine in Bodie. The shaft is being cleaned out and retimbered as rapidly as possible.

Napa.

SHIPMENT OF QUICKSILVER.—*Calistogian*, Jan. 6: During December last, the number of flasks of quicksilver produced at the mines, brought to Calistoga and shipped by rail, were as follows: Napa Consolidated, 375; Great Western, 271; Bradford, 250; Sulphur Bank, 150. Total flasks for Dec. 1, 045. In December, 1888 the shipments from these mines were 1,005 flasks; in Jan. 1889, 972 flasks; in Aug., 1891, 957 flasks. Shipments for these three months were the largest each for over four years—

as far as we took pains to ascertain—until the shipments for last month. In Dec. '88, Jan. '89 and 1891, the increase was due to large shipments from the Napa Consolidated mine.

Nevada.

CALIFORNIA MINE.—*Grass Valley Union*, Jan. 2: The shaft of the California mine is now down 65 feet below the 200-foot level, and the work is being pushed as fast as possible in order to open a new level. The drift south on the 200 level is being extended, and the vein although only a foot in width is of excellent quality and gives good returns in the mill. The mine has never looked as well as now. With the opening of a new level there will be 150 feet of backs, which will furnish ore for the mill for a long time to come.

ORMONDE DISTRICT.—The Maryland claim on the South Yuba, near Canyon creek, is being developed in good shape by Messrs. Donahue and Stewart. They are extracting ore right along from Tunnel No. 1, which is in 80 feet with a 70-foot upraise. There is about 100 tons on the dump, and it will be crushed soon at the Washington Co.'s mill. They recently started another tunnel that will give them 200 feet of backs.

FRENCH CORRAL DISTRICT.—The Kate Hayes Co., although much hampered by the restrictions of the anti-mining injunctions, are working away regularly to enough advantage, to keep the town from absolutely going to decay. They wash the bank by the hydraulic process, then raise the debris 40 feet with an elevator, and run it off into settling reservoirs, so that nothing but clear water passes into the Yuba.

BIRCHVILLE DISTRICT.—A few years ago the white miners being scared off by the antidebris litigation, a company of Chinamen bought a gravel claim situated between the towns of Birchville and Sweetland. They paid \$4000 for it. They are still working there, and up to date have taken out a little over \$50,000.

SWEETLAND DISTRICT.—R. Thomas is preparing to work out a hitherto neglected point in his placer claim, and it is safe to foretell that he will find enough gold to pay him handsomely. The ground was worked for a number of years until a comparatively late period, and it has yielded several big fortunes.

PLEASANT VALLEY DISTRICT.—The Beckman Hill Company of this city, who are prospecting for the blue lead that is supposed to pass through their claim in traversing the country between French Corral and Mooney Flat, have their incline into the hill about 150 feet, and expect to reach the channel within 400 feet from the starting point. The incline has a descent of only about one foot in five. Much wash gold has been heretofore found in that vicinity, and the Beckman Hill Co. has a good show for striking the main deposit.

LOWELL HILL DISTRICT.—The Ballantyne claim, owned by Oscar Foss of San Francisco, is being prospected by Jerry Holland and M. Skeahan. Work on the China claim at Remington hill is being pushed rapidly ahead. The tunnel is now in about 800 feet. A. Papa is busy prospecting for gravel at his claim at Melbourne. M. F. Skeahan is taking out gravel at his claim on Democrat hill. Richard Neville is also interested in the claim. They are talking of running a bedrock tunnel in the spring.

GRANITEVILLE DISTRICT.—At D. R. McKallian's National mine, on the ridge this side of Graniteville, the shaft is being sunk and is now down over 50 feet on the ledge. The new hoisting and pumping rig operates admirably. During the past summer Mr. Killican has been getting out some good ore from the upper workings, and the crushing has been done in a five-foot Huntington mill that is on the claim. About a dozen men are employed at the California. For some time past Mr. Foley has centered his efforts on opening up new ground, and now he has a quantity of high-grade ore in sight. The mill, which has been undergoing needed repairs, will soon begin to drop its stamps again.

COTTONTAIL MINE.—*Grass Valley Telegraph*, Jan. 9: We saw some very good ore this morning from the Cottontail mine, near Rough and Ready. Jas. Stead and others of Grass Valley are working the mine, which is located on the Torpie place near Rough and Ready. The shaft is now down about 30 feet and has a good-sized ledge in the bottom, which is well-filled with mineral and shows free gold. The prospect is a good one and will be fully developed.

MINES AND PROSPECTS.—*Transcript*, Jan. 7: The mining industry throughout Nevada county is full of promise for the future. Never at any former period has so much capital been invested in the business, and never has so large a percentage of the claims been yielding bullion. There is no excitement, no inflation of values on account of this gratifying condition of affairs. Everything is being done on a legitimate, and therefore wholesome basis, the same as shrewd and experienced men in mercantile or manufacturing pursuits would go to work to expend their labor and capital in a way likely to yield a reasonable income. The gay and seductive "wild cat" of the feverish and demoralizing days of old, does not find this congenial climate to purr in, and has probably left us never to return. The reports of progress, which are published in the *Transcript* from time to time are well worth reading. They are plain, unvarnished accounts, devoid of exaggeration and glamour so common to mining articles, and which invariably do more harm than good.

YOU BET DISTRICT.—J. S. Goodwin has ten men employed driving a tunnel from the bottom of his incline shaft, which is down 200 feet. The tunnel has now advanced 400 feet, and within from to 50 feet more will reach the blue lead that extends across the country from Dutch Flat to Blue Tent and North Bloomfield. Judge Giles S. Brown and J. Feeley are working the old Brown brothers' claim adjoining Goodwin's on the south. They have a number of men employed taking out large quantities of gravel, and are making money fast. In the sixties, between 6000 and 7000 dollars worth of gold was taken from a small piece of ground in that vicinity. It is one of the richest sections in the county. James McManus has been prospecting for quartz during the past four or five years, at a point on Bear river about two miles from the town of You Bet. He pegs away all alone, sinking shafts and driving tunnels, and expects to eventually find a bonanza. He has obtained good prospects in several spots. County Supervisor Buffington of this city and Warren H. Pierce have been prospecting

for some time at You Bet station on the line of the N. C. N. G. R. R., and as that vicinity is literally seamed with a series of ledges that give every indication on the surface of carrying gold, it is fair to presume that these gentlemen, both of whom are experienced miners, will in time have a big and valuable mine there.

GRASS VALLEY DISTRICT.—The shaft of the Centennial quartz mine has been thoroughly repaired, and things are in good shape for the resumption of operations, which will commence in the spring. The Pennsylvania five-stamp mill has been started up on a large quantity of first-class ore, says the *Tidings*. The prospects underground are very encouraging, the ledge being of good size and the ore of undoubtedly profitable grade. The *Union* says that the shaft of the California mine is now down 65 feet below the 200 level, and the work is being pushed as fast as possible in order to open a new level. The drift south on the 200 level is being extended, and the vein, although only a foot in width, is of excellent quality and gives good returns in the mill. The mine has never looked as well as now. With the opening of a new level there will be 150 feet of backs, which will furnish ore for the mill for a long time to come.

HUNT'S HILL DISTRICT.—The Chinamen who bought the old Harney & Goodspeed ground at Hunt's Hill have a big force of Mongolian drifters at work and are taking out lots of money.

COLUMBIA HILL DISTRICT.—The stockholders of the St. Gothard feel jubilant over the discovery in their mine of an 18-inch ledge, as recently announced in these columns. They have spent many thousands of dollars there in putting up fine hoisting and pumping machinery and sinking one of the best shafts in the county, and they deserve all the good fortune that can come to them. The Delhi continues to turn out big gold bars with its customary regularity. It is a big mine, has a complete equipment and is ably managed.

MOORE'S FLAT DISTRICT.—Since the hydraulic mining industry was suppressed, Moore's Flat has been as quiet as a graveyard. Nothing is being done there in the way of mining, except by a Chinese company that is putting in a dam to restrain debris and will shortly begin cleaning up some bedrock that is known to be rich. At Allegheny, just across the Middle Yuba from Moore's Flat, the Rainbow mine, which has been fabulously rich in spots during former years, but in which the pay chute has been lost for some time, is again coming to the front. A fine body of ore has been found recently, and the owners are in a fair way to soon reap abundant reward for the thousands of dollars they have spent and the pertinacity and faith they have manifested in keeping the prospecting work going ahead.

NEVADA CITY.—*Transcript*, Jan. 8: Dr. Carl Muller this week located a quartz claim on Gold Flat, just in front of Dan O'Donnell's farm and adjoining the Sneath & Clay on the south. An incline will be sunk in the spring.

RELIEF HILL DISTRICT.—The Union drift claim at the town of Relief Hill has a number of owners, including R. P. Rossen, C. O. Jepson, Wm. Harris, John Jepson and Fred Beck, who are the working partners. They have been operating three or four years, and their tunnel is in 1700 feet. They are on an overflow from the Bloomfield channel, they think. Its average width is 150 feet, and the gravel is breasted out for from five to ten feet above bedrock. The gold is of medium fineness, although occasionally nuggets weighing as much as two ounces are found. The claim has free water part of the year. For the last two years it has been paying its way and gives good promise of eventually making its owners rich. The December cleanup was about \$5000. The Davey Bros. and W. H. Penrose, who have leased from the Eureka Lake Co. the Echo claim on the east side of Relief Hill, are in with their tunnel between 500 and 600 feet. They expect to reach pay dirt soon. A Chinese company is drifting the old Waukesha claim with good results. Several parties are doing their annual assessment work in this district, and some of them are liable to stumble on a bonanza most any day.

CENTRAL HOUSE DISTRICT.—The Centennial Co., who have been hunting in the Washington ridge so many years to find the blue lead channel that is known to come down that way, are liable most any day to strike into the heart of it. For some time they have been finding more or less gravel carrying gold, but the bedrock was inclined too much to satisfy their requirements, and they have been driving ahead for the center of the channel. The Central Co. recently found gravel in their tunnel, but the bedrock is pitching off and they are in too high. They will work the ground through a shaft sunk some years ago, and will utilize the tunnel for drainage. The San Jose Co. have not yet got out of the quarrel among themselves that has so long interfered with their going ahead and developing their claim. It is believed that they have some good gravel and that a little more preliminary labor will put it on a paying basis.

NUGGET HUNTING.—*Grass Valley Telegraph*, Jan. 9: During rains or just after, and when the rocks are washed clean, many here are in the habit of going out and looking over old dump piles at quartz claims and along the gulches where placer mining was carried on in the early days, for the purpose of finding gold specimens. In the last few days, a number of nice lumps were picked up—enough to pay pretty well for the labor of searching. Wm. Roland found, on Deadman's Flat, a lump of quartz, and the size of it was about that of the fist of the average man. Lumps of gold, like unto birdshot in size and shape, were all through the lump. A number of experts estimated the value of the specimen, and none put the amount less than \$100.

ST. JOHN.—Friday afternoon, a splendid new ledge seven feet in width was encountered in the St. John mine (Knights of Malta). The ore is different from that which has ever been taken out of the mine heretofore, and it is pronounced by those capable of judging to be ore of superior quality. While but a little free gold can be seen in the ore, it is literally filled with lead and sulphurets. Supt. T. H. Moore informs us that the mine is improving as depth is obtained. The ore taken out Friday evening was from the depth of 230 feet.

LONE TREE.—For several days past, John G. Johnson has had men working on the Lone Tree mine, in the neighborhood of Forest Springs. A new shaft is down about eight feet, and a four-foot ledge showing plenty of free-gold was found. The

rock looked and prospected so well that Mr. Johnson will keep the work going ahead. The Lone Tree has always been regarded as a valuable mining property.

San Diego.

BANNER AND JULIAN. Jan. 7:—The Ruby Co. are working the Wilcox mine at Banner. The ten stamps at the Helvetia mine make merry music on the ore that is coming up the shaft. A good many of the claims on which the assessment work was done last year have been relocated. The Cincinnati Belle has been put to considerable delay on account of the broken whim. The 200-foot shaft contracted by Murphy Bros. has been completed.

Shasta.

MACARTHUR-FORREST PROCESS.—*Redding Free Press*, Jan. 4: The Calumet Co. having made a series of experiments on the process, as applied to their ores, are making heavy expenditures, and will without any more delay than possible, so we are informed by Mr. A. B. Paul, manager of the company, bring the working up to 50 tons a day, they having stamping capacity already in for that number of tons. The Shasta Gold Extraction Co.'s mill is fully fitted up for the process, but has been prevented running on account of the bad roads making it impossible to get ore to the mill at a reasonable expense. With these two mills in operation, it will be an easy matter for our millmen to get a practical idea of the working of the process.

Sierra.

GOOD PAY.—*Mt. Messenger*, Jan. 2: The workmen in the Telegraph mine found good pay a short time since. The gravel prospects from \$10 to \$12 a carload. How much gravel they have or what the channel is they do not yet know. Seven ounces of gold were brought down last Wednesday by Gardner & Mitchell.

YOUNG AMERICA.—*Mt. Messenger*, Jan. 9: John Barnard came down from the Young America mine last Monday. He reports 60 men employed, all told. It is generally thought that the explosion of Giant powder in one of the batteries was purely an accident, and no one is to blame. The cleanup of the Phoenix quartz mine, Sierra City, for the past 25 days, was \$4800.

Siskiyou.

PLENTY OF WATER.—*Siskiyou Telegram*, Jan. 9: The gravel miners throughout the county are confident of a prosperous season this year, as they will have an abundance of water to successfully carry on operations.

QUARTZ.—*Yreka Journal*, Jan. 4: Quartz mining is carried on energetically at present at Humboldt, all the mills being kept in operation steadily. By means of sleds, the quartz is hauled to the mill with greater ease than by wagons, hence a great amount of gold will be realized during the present winter.

RIVER MINING.—The river miners along the Klamath are still taking out pay gravel, with good success, and if we have no heavy rain storms, they will be able to continue operations all winter before high water interferes.

THE HYDRAULIC MINERS have commenced work in several localities, and others will be able to do so shortly, provided the nights are not too cold to prevent the snow from melting to fill their ditches. The hydraulic miners will have the best season ever known in Siskiyou, from the fact that there has not been any rain of consequence to dissolve the vast quantity of snow on the hills and mountains.

MANY PLACER MINERS have been enabled already to commence ground sluicing and washing in extensive lines of sluices with good success, and are likely to continue doing so until late in the summer, or until winter is at hand again, which will be an unusual occurrence. The coming summer will have to be an extraordinary dry and long-continued hot season to prevent the miners from taking out more gold than during any previous year since the settlement of our county by white people.

NEVADA.

Tuscarora District.

DEL MONTE.—*Tuscarora Times-Review*, Jan. 9: Second level: West drift from No. 1 joint raise in 53 feet, with seams of low-grade ore in the face. The stopes opened up on the line have exposed good ore two feet wide. Extracted four cars first-class ore, assay \$260 per ton, and 38 cars of second class, assay \$33 per ton.

NEVADA QUEEN.—Second level: No. 1 south drift advanced 13 feet, face in vein porphyry. No. 2 south drift extended 22 feet, showing a seam of ore in the face.

NORTH COMMONWEALTH.—Second level: Winze from second level sunk 30 feet in porphyry. West drift from winze chute in 15 feet; seam of good ore four inches wide. East drift from same point advanced 22 feet, 2½ feet of ore, average assay \$166 per ton. Hoisted seven cars first class and 43 cars second-class ore. The ore shipped (42 tons) has been delayed on the road by heavy snow storms, but will arrive at the railroad to-morrow.

COMMONWEALTH.—Fourth level: Joint raise has been put up 20 feet, cutting seams that indicate the proximity to the footwall of the vein.

NAVAJO.—A drift started on a vein running south from the 350-foot crosscut, has advanced 11 feet, giving some very fair assays. No. 2 winze below 350-foot level sunk five feet and was stopped. The stopes are producing as usual.

BELLE ISLE.—Intermediate drift below 350-foot level on No. 2 vein, extended four feet, showing very fine ore. The stopes on Nos. 2 and 3 veins are without any change and are yielding as usual.

NORTH BELLE ISLE.—No. 3 north drift, 400-foot level, advanced 16 feet, showing some good ore in the face. No. 1 intermediate winze from intermediate, sunk seven feet, showing a strong vein of high-grade ore. No. 4 north drift, 500-foot level, advanced 19 feet, showing some very fine ore. The stopes are yielding as usual.

Washoe District.

CON. CAL. & VA. MINE.—*Virginia Chronicle*, Jan. 9: 1100 level.—The west crosscut No. 1, from the south drift, has been extended 71 feet; total length, 574 feet; the face being in west country rock. From this crosscut, at a point 520 feet in from the main north drift, a north drift has been advanced 25 feet in a quartz formation carrying a nominal value. From the drift run southeast from the main south drift, 40 feet south from the east crosscut No. 4, at a point 130 feet in, a west crosscut No. 2 has

been advanced 25 feet, in porphyry with quartz of low assay value. 1750 level.—In working out and upward from the bottom of winze No. 2, sunk from the 1650 level we continue to extract ore of fair quality. Have also extracted some milling ore at the point where the upraise carried up from the crosscut run west from the southwest drift made connection with the stapes on the eighth floor. Have continued to extract ore of average quality at the point where the upraise from the southwest drift 70 feet north from the south line of the California ground connected with the eight-floor stapes. In the east crosscut No. 3, from the main south drift, some ore has been extracted. There has been extracted from all parts of the mine during the week 994 930-2000 tons of ore, which was shipped to the Morgan mill. The average value of all of the ore worked at that mill during the week, 980 tons, was \$22.95 per ton. Bullion shipped to Carson Mint, assay value, \$18,541.83.

OPHIR.—1465 level.—At a point in the main south drift on the sill floor of this level, opposite the upraise No. 2, a drift was started and has been advanced in a southeast course 30 feet. From the end of this southeast drift an upraise has been started and will be carried up to connect with the drift run west from the winze 122 feet below the sill floor of the 1300 level. No ore has been extracted or hoisted during the week.

MEXICAN.—On the 1465 level the crosscut started west from the bottom of the winze sunk 101 feet down from the end of the crosscut run west from the main north lateral drift near the south boundary line of the mine, has been advanced 90 feet. Have enlarged the station at the head of the winze and are now placing therein a small engine hoist.

UNION CON.—On the 900 level the joint Sierra Nevada and Union Con. west drift from the shaft has been extended during the week 30 feet; total distance west of shaft, 1625 feet. The face is in hard porphyry.

SILVER HILL.—During the week have repaired 100 feet of the south drift from the Justice shaft, 490 level. This drift reaches nearly to the north line of the Silver Hill.

ALPHA.—The north crosscut from the winze, 550 level, is out 217 feet; face in clay and quartz yielding low assays. The west crosscut, 79 feet south of winze, 550 level, is out 14 feet; face in low grade quartz.

CHOLLAR.—The north drift from incline station, 1500 level, is out 60 feet; face in porphyry. The joint west crosscut on north line from Hale and Norcross, 1640 level, is out 57 feet; face in porphyry.

POTOSI.—The south drift from top of raise, 1200 level, is out 60 feet; face in quartz yielding low assays. The east crosscut from the winze station, 1400 level, is out 74 feet; face in porphyry. During the week, have started an east crosscut from the winze station, 1500 level; it is out four feet; face in porphyry.

BULLION.—The east crosscut on the north line of the 1300 level is out 508 feet; face in porphyry. East crosscut on north line, 1400 level, is out 67 feet; face in porphyry.

WARD COMBINATION SHAFT.—West drift from the shaft, 900 level, has been advanced a total distance west of shaft 1625 feet; face in hard porphyry. The southwest drift, 1800 level, is out from the shaft 940 feet; face in porphyry.

CON. NEW YORK.—The west crosscut No. 3, 650 level, is out 41 feet; face shows three feet of quartz. The west crosscut No. 4, 70 feet north of shaft, same level, is out 70 feet; last eight feet of quartz shows bunches of fair grade quartz.

UTAH.—750 level: At a point 50 feet south from the winze station, west crosscut No. 1 has been advanced a total length of 189 feet; in porphyry and west country formation. A north drift has been started and advanced eight feet from a point 140 feet west of the shaft station.

ANDES.—On 420 level, north drift from east crosscut No. 4 advanced 22 feet; face in quartz and porphyry that yield low assays. A north drift has been started from east crosscut No. 6 at a point 50 feet east of the main north drift.

UNION SHAFT.—West drift, 900 level, is out west of shaft a distance of 1625 feet; face in hard porphyry.

BEST AND BELCHER.—900 level: North drift from top of upraise from 1000 level has been advanced 30 feet, through hard porphyry; total length 50 feet.

GOULD AND CURRY.—400 level: Upraise No. 2, 300 feet southwest of shaft has been carried up 18 feet; total 32 feet; face in soft porphyry and quartz showing some value.

OCCIDENTAL.—The drift started north from west crosscut in south drift on 350 level has been extended nine feet in fair grade ore.

ARIZONA.

MINNESOTA DISTRICT.—Mohave Miner, Jan. 9: The Eagle mine in Minnesota district has closed down.

WEAVER.—W. A. Neal and John McGregor have returned from their prospecting trip in Weaver district. They brought in some good-looking rock, which assayed so well that they will go right away and develop their new find. Tom Steen has a pretty good thing in Weaver district, in his Jenny mine. He has 40 feet of ore stripped ready to take down. The ore streak is from 18 to 20 inches in width, and runs away in the hundreds in silver.

CEDAR.—It is expected that work will be commenced on several good mines in Cedar district as soon as the snow disappears from the mountains. There are a number of excellent properties there that can be made pay handsomely on an investment of from \$50,000 to \$750,000.

CERBAT.—Work will shortly be commenced on the Cerbat mine, owned by the Arizona Northern Mining Co. of Minneapolis, Minn., of which John Barry is superintendent. The mine is one of the best in that part of the Cerbat range of mountains, and will prove a great bonanza under proper management. The Gold Bug mine still continues to improve as depth is attained. Fortysacks of \$600-ore was taken out recently in a day and a half by the lucky owners, and they have by long odds the best paying property in the new district. They have two tons of high-grade ore at the sampler awaiting treatment. Wm. Heimrod has taken a lease on the Mineral Park mill, which will immediately be fitted up as a wet crusher, with plates and concentrators. RICHMOND BASIN.—Silver Belt, Jan. 9: Rich-

mond Basin mines are again coming to the front as silver producers. J. W. Killen is reported to have made a fine strike in the Nugget mine, owned by E. F. Kellner. Joe Henry and Geo. Kingdon, lessees on the Mack Morris, have good ore, and Geo. Wilson and Leroy Ikenberry have taken out ore in quantity, which they will soon mill. Joe Brewster brought in several tons of ore recently for shipment, and has an excellent showing in his mine.

OLD DOMINION.—The Old Dominion Copper Co. has been delayed in blowing in its new furnaces, owing to the failure of water in its new well. A short time ago the supply was abundant, but last week the discovery was made that there was not near enough water to supply its plant. The work of sinking has been carried on day and night this week, and the water is steadily increasing. Two furnaces will be in blast within a few days.

ARIZONA.

THE OLD DOMINION COPPER CO.—Arizona Silver Belt, Jan. 2: The business of the Old Dominion Copper Co. for the year 1891 has not been fully computed, but very accurate estimates have been made which show that the year just closed was a fairly prosperous one for the company. Of ore there was smelted 28,800 tons, and the product of copper was about 7,270,000 pounds, as against 7,720,000 in 1890. The lessened output was due to the floods in February last, and to several other unavoidable interruptions. A large amount of development work was done and many important improvements made, chief of which is the new smelting plant and cable tramway now about completed. The large amount of extra work performed necessitated the employment of an increased force, and there are now about 200 men employed by the company at mine and smelter, and nearly, if not all, of the present force of employees will be retained, as the company expect to work their properties on a large scale the present year. The two new smelters, with a daily capacity of about 70 tons, will be blown in about the 6th or 6th inst., and it will require a large and steady supply of ore and coke to keep them running. The new plant is one of the most complete of its kind in the Southwest, and is highly creditable to Supt. A. L. Walker, to whom its erection is due, and who worked out the designs himself to the minutest detail. Following is the yearly production from the commencement of operations by the old company: 1882, 1,940,770 pounds; 1883, 4,584,530 pounds; 1884, 7,368,675 pounds; 1885, 4,886,610 pounds; 1886, 4,567,665 pounds; 1887, 1,444,770 pounds; total, 24,792,960 pounds. New Company—1888, 4,633,160 pounds; 1889, 5,915,510 pounds; 1890, 7,720,015 pounds; 1891, 6,270,000 pounds; total, 25,558,685 pounds.

BRITISH COLUMBIA.

BIG SURFACE SHOWINGS.—Nelson Miner, Jan. 6: William Moore and William Lewis are hard at work on the Peterborough, a claim located to the north of the railway and about ten miles west of Nelson. The Peterborough is in a section abounding in big surface showings, but the dozen or more claims which have had work done on them still remain of doubtful value.

TUNNEL ON THE LIZZIE C.—Three men are at work driving a tunnel on the Lizzie C, a claim 2½ miles below Nelson. The tunnel is in 60 feet, and when in 200 will tap the ledge at a depth of 150 feet. The owners of the claim—Tom Collins, Dr. La Bau and others—think they will have a mine when the ground is properly opened.

SILVER KING.—The report that the Silver King mine has been sold to a Scotch company is now generally believed. It is not known what price was paid for the property, but it is supposed the Hall interests (one-half) receive \$500,000. The capital of the purchasing company is stated to be \$2,500,000.

COLORADO.

AT LEADVILLE.—Herald-Democrat, Jan. 7: The mines of North Iron Hill have been rather neglected by us for a few weeks, but it must not be thought from the absence of reports from that section that no work is going on there. Quite the reverse is the case, and the Dolomite shaft, which is probably the most northern one, is being sunk quite rapidly, having already attained a depth of more than 320 feet. The bottom is still in the quartz matter, highly mineralized, spoken of in our last report, and gives promise of soon catching the chute upon which the Flagstaff folk worked last year, and from which they shipped so much good ore. As the dip of the strata from the Flagstaff is toward the Dolomite shaft, it is reasonable to suppose that the latter will catch that ore body about 50 feet lower than it was met with in the Flagstaff. The Flagstaff lessees have made the initial effort in starting up, by doing a lot of work in No. 1 shaft, though the chances are that, ere long, No. 2 shaft will be carried down at least 100 feet farther. Caves have occurred in the Toyama and Avoca claims that have extended to the Belgian stapes, and which will necessitate the driving of a new drift from the 413-foot level in order to reach even this small streak. At the Humboldt, in the north drift run from the bottom since the shaft was sunk some 60 feet deeper, the upraise has been successfully accomplished and the ore streak caught about half way between the two levels. This, however, was found to be dipping so fast that the level was carried forward, and the ore is now disclosed on the breast, and shipments are being made from it. The ore seems to be from the original chute, from which so much good ore has been shipped, as some streaks in it carry about 15 per cent of lead to the ton, whereas latterly the ore has been of a dry, silicious nature. Altogether, the outlook in that particular region is encouraging, and without doubt this month will see a considerable improvement in many of the mines located there.

OVER 100 TONS A DAY.—Aspen Times, Jan. 9: The Holden Lixivation Works are treating over 100 tons of low-grade ore per day and shipping the product by express. The product runs from \$4000 to \$17,000 per ton. The supply of ore for the works is unlimited. Four carloads of 500-ounce Mollie Gibson ore were on the track for sampling at Taylor & Brunton's yesterday.

THE MINERAL FARM.—The fifth level of the Mineral Farm has been run north of the incline over 30 feet in good ore. A 40-ton lot from this

place was sampled yesterday, from which the grab sample ran over 46 ounces. The footwall sump will be ready to-morrow to receive the water that comes through the hanging wall on the fourth level. Work on the incline will be started in a few days.

THE BEST FRIEND.—Late developments in the Best Friend mine are exceedingly encouraging. Manager Casey has been running a drift southerly from the bottom of the incline to develop that portion of the mine. The drift was below the line of the main ore body, but a few days ago he upraised a few feet and opened into a body of very high-grade mineral, three feet of which averages about 365 ounces silver per ton.

DAKOTA.

EXPERIMENTAL PLANT.—Deadwood Pioneer, Jan. 9: The machinery for the experimental plant of McGee & Dahlgren arrived yesterday and will be immediately put into position. The blowing in of the plant has been delayed over a month by the non-arrival of this machinery, and now that it has arrived, it will soon be demonstrated to the people of this section that the process of these gentlemen will revolutionize the treatment of refractory ores.

GALENA.—Mr. S. Moll, of Galena, who arrived in this city yesterday, reports but little mining being done at present at Galena, and probably will not be until spring.

IDAHO.

RAILROADS DISCRIMINATING.—Snohomish Eye, Jan. 4: The mine owners of the Coeur d'Alene country have decided to close down all the mines in that district on Jan. 15th, unless the Northern Pacific and Union Pacific railroads grant a reduction of \$2 per ton on all ores to Missouri river points. The present rates are said to be exorbitant, and it is charged that unjust discrimination is practiced by the railroad companies against the mine owners. The charges on a carload of ore from the Coeur d'Alenes to Omaha is \$360, or \$18 per ton, while the tariff on a carload of wheat from Tekoa to Chicago is only \$240, or \$12 per ton. This discrimination is rendered more apparent from the fact that ores are shipped the whole year around, while the shipment of wheat is only for a season of the year, and is a more or less perishable product. This difference, it is claimed, is in no wise caused by the cost of handling, because the miners load the cars and the railroads do nothing but haul the ore from the mine. If the railroads should give the reduction asked, the mine owners claim that they will then be paying \$4 per ton more for the haul to Omaha than is paid for transporting wheat from Tekoa to Chicago.

VENUS.—Silver City Avalanche, Jan. 9: Vigorous work on improvements is now going on at the Venus mine, recently purchased from the Norton Bros. by E. H. Dewey, who has interested Pittsburg parties with him in the property. Men are now at work building a boarding and bunk house, blacksmith shop, etc., and a tunnel, which will be over 600 feet long when it reaches the ledge, has been begun. The mine, which lies near the summit of Florida Mountain, southeast of Jacobs' Gulch, where so much rich placer ground was worked in early days, is the farthest west of any ledge discovered on that mountain. It is a very wide ledge—in fact its width has not yet been determined, and the ores in it work very free and can be milled probably by the cheapest process.

NAKED TRUTH SOLD.—John Biggs sold his interest in the Naked Truth and Leopard mining claims to E. H. Dewey, who had formerly purchased Pete Donnelly's interest in the same properties. These two claims lie on the east side of Florida Mountain, about midway between the Trade Dollar group and town, and persons acquainted with them say that they both make a fine showing for the amount of work done on them.

IDAHO.

DE LAMAR BULLION.—Nugget, Jan. 4: Eight bars of bullion were sent out on the stage last night and four more follow to-night, making, with the 16 shipped during December, 28 bars for the month. The average value of these bars is \$2000, or \$56,000 for the month. On account of using new pans, the shoes and dies of which had not been thoroughly broken in, and numbers of slight delays caused by the machinery being much of it new, the above amount may not be considered a fair average of what the output of the mill will be. An evidence of this is the fact that the yield of the first half of the month was only eight bars. As the present mill would be worn out before the ore in sight could be worked up by it alone, it may readily be inferred that the contemplated larger mill will be added this year, and the dividends declared be correspondingly increased.

LOWER CALIFORNIA.

ALAMO.—Lower California, Jan. 2: The rich vein recently struck in the Princess mine is widening out and getting richer. It is believed to be the true Aurora vein. There is much activity among small mine owners, and the custom mills are crowded with ore. The new strike in La Flor mine holds out and promises to be a bonanza. Rich rock is coming up from the Candelaria, controlled by Geo. Zimpelman. Several Mexicans are placing at Las Encinitas, down towards Santo Tomas canon.

MONTANA.

CAMP CREEK.—Inter-Mountain, Jan. 9: The next railroad enterprise to be inaugurated in this county is a road to the new and promising mining district of Camp Creek. It is likely that the Union Pacific Co. will build the road, starting from Melrose and following an easy grade a distance of 12 miles to Camp Creek. This section is beginning to attract considerable attention in mining circles, and particularly among Eastern capitalists who have their agents in this State looking around for profitable fields for investment. It is understood that negotiations are now pending for the purchase by an Eastern company of a group of the most promising claims. Should it go through, it will give Camp Creek a boom which it has never had, unless it has been among the prospectors who have been flocking in there during the past year locating every available foot of ground. The prospects of Camp

Creek, as far as developed, show the highest grade ore of any new mining district in the State. This district is about 25 miles south of Butte.

NEW MEXICO.

THE OLD GOLDEN RULE MINE.—Southwest Sentinel, Jan. 9: There are four carloads of ore at the depot in this city, shipped by N. Bell from his Santa Rosalie mine, in the Dragoon mountains, formerly the well-known Golden Rule mine. Owing to his inability to get teams to haul the ore to the mill at Pinos Altos, Mr. Bell has directed that no more ore be shipped here from the mine until a contract can be made for hauling it. Last week, Mr. Bell directed Assayer Black to take a disinterested party and carefully and fairly sample a carload of the ore, which was just as taken out of the mine, without sorting. Mr. Black did so in the presence of Mr. C. F. Bottom of this city, and a representative of this paper was shown the assay certificate of Matthews & Black, the reliable assayers, and the value shown was 2.4 ounces in gold and 3.2 ounces in silver per ton, or about \$50 per ton. This for a condemned, "salted" mine is certainly a good showing, and Mr. Bell will reap a rich reward for his faith in the property.

OREGON.

WHITE SWAN.—Bedrock Democrat, Jan. 4: The person who has not recently visited the White Swan mine, east of the city, has a faint idea of the scene of activity presented, and the change from what it was less than three months ago, about which time this wonderful gold deposit was discovered. At that time, there were no signs of civilization manifest, but now the visitor is confronted with evidences of an embryo city. The coming spring, the White Swan Company contemplates an enlargement of operations, which will necessitate more buildings. In addition to this, other discoveries in that vicinity will be worked, adding increased improvements, putting the new camp on the high road to become an important settlement in Baker county in a very short time, the future of which may have in store many possibilities.

BAKER COUNTY MINES.—Owing to the heavy snows on the mountains and the blocking of the highways, there is little news concerning mining operations in the various camps. The mines in operation are well supplied with everything required during the winter months, and only in extreme cases is there any necessity for the owners or miners to come out to civilization. The number of mines being worked this winter is greater than ever before in the history of Baker county, and by the approach of spring, the progress made in development will also be greater than ever known before, thus offering an inducement for capital to make examinations and investments. The year 1892 will certainly mark an era of unequalled prosperity for the mines of Baker county. This seems to be the prevailing opinion among mining men; in fact, the whole community.

ON GALICE CREEK.—Grant's Pass Courier, Jan. 7: D. L. Green was in from the Sugar Pine mine on Galice creek Thursday last. This property, which has been worked with an arrastre for 16 years, has always yielded well, but a few days ago the lower tunnel, which is now in 500 feet, ran into the ledge which had been opened on the upper level, and a vast body of high-grade ore was exposed. Free gold and galena, which will yield 5000 and upward to the ton, with every indication of being a permanent ledge, would make any old miner feel as though he had at last struck it rich, and the boys certainly have done so. Their arrastre is so situated that the ore from the tunnels gravitates from the ledges and there is no time lost in putting it through the mill. The mines are situated 30 miles southwest of Grants Pass, and the gold dust and concentrates are shipped from this city. There has been an impression that the quartz ledges of Josephine county were merely broken pockets, and that no well-defined ledge of any length had ever been found. The Green Bros. have run over 3000 feet of tunnels, besides many feet of shafts, and the ledge presents an unbroken front at all points.

UTAH.

CAMP CROSSCUTS.—Park Record, Jan. 9: Ore-hauling is now very active. The roads are in splendid condition, and all the ore contractors are taking advantage of them. Johnny Varcoe is putting in a large ore chute, and making other extensive improvements in connection with his jigs at the May Flower dump. The trouble at the Anchor shaft has all been settled and sinking is going forward rapidly. An entire new force of miners and engineers has been employed. The Northland people has a force of men at work continuing the raise being made in that property to locate the apex to the vein in dispute. The Lawrence boys are still prosecuting work on their Treasure Hill claims. The tunnel they are driving to tap the ledge exposed in the old incline, has been going ahead nicely until recently, when broken ground was encountered, necessitating timbering. As there is considerable timber on their ground, this difficulty will soon be overcome. The Woodside has invested in a new air compressor and several Burleigh drills, and in future, prospecting in that valuable property will not be so slow.

WASHINGTON.

FIRST THOUGHT.—Okanogan Outlook, Jan. 7: A rich strike is reported in the First Thought. In the drift on the footwall of the ledge in the lower workings, a chute of ore was encountered, assaying from \$700 to \$800 per ton. Since starting up a little over a year ago, the First Thought has been developed to the extent of some 6000 feet in tunnels, drifts and crosscuts, and has, undoubtedly, a larger amount of ore in sight than any two other mines in the county. Superintendent Fisher has received notice to shut down development operations. It has been the custom of the company to suspend work during the winter months.

MINERS MEETING.—Lack of space prevents our publishing accounts of the meetings held in various counties for the purpose of appointing delegates to the State Mining Convention. In most cases amiable resolutions have been adopted and earnest men appointed.

MECHANICAL PROGRESS.

American and English Rolling Mill Work.

A Scotch iron worker, who recently visited the Homestead Works of Carnegie, Phipps & Co., in Pennsylvania, and saw the enormous amount of work done, said: "If I were to go back to Scotland and tell them there what I have seen to-day, they would tell me very quickly that I was 'gaffing' them. You roll just four plates while we roll one in the old country. Another important thing is that you need not get your steel so hot as we do at home. You must know that in our plant we use soft rolls, and it is absolutely necessary to bring the steel to the rolls with a dripping heat so that no foreign particles may cling to the surface of the ingot and thus indent the rolls. It is also necessary to scrape the bottom of the ingot or slab before it is pressed through the rolls. There is no use denying the fact that you Americans have left us far behind in the iron and steel mills."

When one whose interests are so materially affected, makes such an admission, there seems to be little room for doubt as to the superiority of American industry and enterprise, and very little occasion for prejudice against American products. Such comparisons, however, should not be made with a view of decrying the merits of one in order to show off to advantage the merits of another. Every machine or process should stand on its own merits, and any superiority should be accepted as an object lesson to teach better make or practice to the one which is inferior. American machinery and processes may be superior at some points to those in Europe. On the other hand, Americans may learn much from the old country. The rivalry between us should be open and fair. We should be willing to give and take. In no other way can we better make progress.

Something Further About Steel.

In our last issue, we gave an article from a correspondent of the *American Machinist* headed "An Interesting Experiment with Steel." In the next number of the *Machinist* we find the following criticism upon that article from the pen of S. W. Goodyear:

Under the heading, "An Interesting Experiment with Steel," in the *Machinist* of Nov. 12th, are some statements which, in my "rule of thumb" way of treating the steel question, I wish to hold up to the light—that is, to such light as the plain, practical steel worker can comprehend. That steel is such in consequence simply of a "combination of iron and carbon" is not or need not be "the universal idea."

Steel may be as truly steel with practically no carbon combined as though it had combined the highest percentage possible. The question, What constitutes steel, as distinguished from iron, is not to be settled simply by the presence or absence of carbon. Steel may be adjudged to be iron, because heating to hardening heat and suddenly cooling utterly fails to harden it. Iron may be called steel simply because it does harden readily under the same treatment to which hardening steel responds, and still the soft, nearly carbonless steel is just as truly steel, and the hard, highly carbonized iron is just as truly iron as though the test of hardening had shown what might be expected.

It is a question of structure, not a question of carbon.

For certain uses, it is necessary or desirable, to say the least, that steel should contain certain percentages of carbon, the exactly right amount naturally insuring, under proper conditions and treatment, the best results; but that "two per cent of carbon" exists in "steel wire nails" and "iron cut nails" must strike those who had supposed that something was known of the make-up of steel and iron in the light of a new discovery. Two per cent! What can be meant? That would be too high for tool steel. More than twice as high as the average of tool steel in general use!

"When steel is heated, the atoms of carbon have a tendency to unite, and form comparatively large particles; when slowly cooled, these particles remain large; but on being chilled, the molten particles are shattered to atoms. In this way, the surface area of diamond presented to iron may easily be increased from ten to one hundred times. With this increased surface, contact, and the more thorough diffusion, it is not difficult to understand why steel should harden on being chilled."

I believe the above to be accurately quoted. Now, as a statement of facts, in my judgment, the judgment based upon much experience and observation, I say, only when heated efficiently to produce such result, to the first statement; and to the second, only when chilled from a right heat; and as to the third, i. e., the assumption that the phenomenon of hardening is explained by the alleged fact that chilling breaks up the larger particles, and produces a finer condition, I say, unsupported. At a right heat, there will be produced by chilling, by hardening, the promised fine condition, with hardness. At a higher heat, there will be as great hardness, but with it will come coarseness, a disorganized, uneven structure, as unlike the other as it is possible to conceive—the one as fine as flint, and as beautiful as a diamond, the other as coarse as pig iron; both the same material, different parts of the same piece,

if you please, so that to say "heating and cooling slowly or quickly produces certain results, needs to be modified. Question of, how hot? comes into the account.

As to "arrangement of diamond particles in temper drawing as shown by color." Hardening does that arranging. Tempering, by many, is believed to change the grain, size of "particles." I don't believe it. So again annealing softens, by many is believed to mean necessarily changes the grain, makes the particles coarser. I don't believe that either. That it often does, I know; that it is necessary in order to soften, is another thing. Hardening at proper heat—at the refining heat—will produce the much admired, even grained condition of fineness referred to. So will working properly at proper heat; so will cold working. No, no, we cannot settle the question of why steel hardens in this way. Let's have proof which proves.

CULLOM'S CAR COUPLER BILL, to which we alluded in our last issue, seems to be attracting much attention, not only among railroad circles, but among the general public as well. The necessity for some uniformity and better service in regard to the coupling of cars is enforced by President Harrison in his recent message to Congress by a reference to the great loss of life resulting from inefficiency or carelessness in this direction. The President, in calling attention to the great loss of life in the railway service of the country, refers to the fact that during the year ending June 30, 1890, 369 brakemen were killed and 7841 maimed while engaged in coupling cars. The total number of employees killed from all causes during the year was 2451, and the number injured 22,390. This, he holds, is a cruel and largely an extra sacrifice. The Government is spending nearly \$1,000,000 annually to save the lives of shipwrecked seamen; every steam vessel is rigidly inspected and required to adopt the most approved safety appliances, and he expressed an opinion that a law requiring of every railroad engaged in interstate commerce the equipment each year of a given per cent of its freight cars with automatic couplers and air brakes to be used, would very soon and very greatly reduce the present fearful death rate among railroad employees.

THE DOUBLE BELT QUESTION.—It may seem strange, says a contemporary, that a double belt should be so much more effective and durable than a single one, the surface contact being the same in both cases. One cause of superiority is that in a double belt a weak spot in the leather of one belt is likely to be covered by a stronger part of the other belt, and thus prevent the weak spot from stretching and forming a curve. The main cause of excellence is that in a double belt the limit of elasticity is not so easily reached. When the elasticity has gone from a belt its life is ended. When at work a belt stretches out in length, producing a slack side, which is best shown in a horizontal position, as from the line shaft to the counter shaft, and when the load is thrown off, the belt recovers itself unless the limit of elasticity has been reached. Elasticity consists not alone in stretching out. There must be a tendency to pull back.

CURIOUS KNIVES.—When Sheffield first became famous for its cutlery, a peculiar-shaped knife, designed for a variety of uses, was made with great care and sent to the agent of the Cutler's Co. in London. On one of the blades was engraved the following challenge:

London, for thy life,
Show me such another knife.

The London cutlers, to show that they were equal to their Sheffield brothers, made a knife, with a single well-tempered blade, the blade having a cavity containing a rye straw 2½ inches in length, wholly surrounded by the steel; yet, notwithstanding the fact that the blade was well tempered, the straw was not burned, singed or charred in the least. It is needless to add that the Sheffield cutlers acknowledged themselves outdone in ingenuity. —*St. Louis Republic*.

AN UNEXPLAINED PHENOMENON.—At a recent meeting of the Iron and Steel Trust in England, a member showed that the interior of a piece of mild steel may be raised to the fusing point while the outside remains solid, just as if one were to try to melt an iron tube, closed up at each end and filled with some metal of a lower melting point than iron, in which case the heat would penetrate through the iron and liquefy the interior long before the tube itself would be affected. The member showed some curious specimens of shells of crop ends and other pieces of scrap steel, which had retained their exterior form, although about two-thirds of the original mass had melted out. No explanation of the phenomenon was offered.

LUBRICATING MACHINERY.—No oil has been made, says a contemporary, that can economically lubricate all the journals of a mill. An oil running a heavy Corliss engine would not do to run a spindle or a fast-revolving dynamo. The former runs slowly and has great pressure and strain on its journals, and consequently requires an oil which will not spread too quickly, but with low gravity and high viscosity. The latter needs a pure mineral oil, viscous and quick, to enable it to enter into the closest parts of the bearing as rapidly as the speed at which it revolves necessitates.

SCIENTIFIC PROGRESS.

Heat and Electricity.

Their Influence Upon the Body in Health and Disease.

Dr. J. D. Bonnar recently read a very interesting paper before the Buffalo Electrical Society, from which we summarize as follows:

The cause of sun heat is generally considered due to the passage of the light rays of the sun through our atmosphere. Light, heat and electricity bear a striking relation to each other; in fact, they are convertible terms—either may be converted into the other. Heat and motion are also interconvertible. This latter statement is true of matter, whether in masses or in molecules. Chemistry also shows that the combination of substances having chemical affinities for each other produces heat.

To go back to our starting point, viz., that the sun is the origin of all heat, and also of all light. We are told by astronomers that the sun is a great molten mass. From our own experiments, we learn that all bodies which combine chemically with each other have certain opposite electrical conditions, and they unite with each other, producing an electrical current, which may be conveyed along wires to distances remote from the place of origin. We find that the electrical conditions are in definite and constant proportion to the attraction or force with which bodies seek to combine with one another. Hence, may we not justly conclude that in the sun the same conditions control the chemical combinations continually going on in its structure? If we are justified in this inference, then we are also justified in the assumption that electrical attractions between the bodies entering into combination are set up and currents sent in all directions throughout the solar system, and only producing light and heat when they reach the atmosphere which envelopes the earth. The currents of electricity are met by the resistance of the atmosphere, which is a very poor conductor of electricity. Hence, we have both light and heat, which we know are produced by electrical currents, when transmitted through bad conducting media, such as platinum wire or bamboo cane, and just in proportion to the resistance offered in the track of the electrical energy. The diffused light of day can then reasonably be regarded as the fruits of the infinitely great number of electrical rays passing from the sun through the resisting atmospheric media. When the air is full of moisture, the day is darker, due, no doubt, to the well-known fact that moist air is a much better conductor of electricity than dry air, presenting, as it does, much less resistance to the electrical effort to reach the earth.

The sun "might be looked upon as a huge battery," in which the elements are constantly combining and decomposing, and thereby originating or generating electrical rays.

Heat and electricity are so intimately related, as to be, in fact, an offspring the one of the other, and it often tests the discernment of the most astute reasoner or observer to tell which is the parent power. Coincident with an increase in the electrical potential in the human body, or part of the body, there is also an increase in the heat of the same, and when our bodies are in a highly electrical condition, or in high potential, we are warmer than when the potential is lower; so, therefore, we find people more vivacious and merry in dry and bright weather than in damp conditions of the atmosphere. By means of the moisture, the electrical potential is lessened. Again, we find that in all inflammatory conditions there is an increase in the positive electricity, so we treat inflammation and all diseases which show increased activity in a part, by applying the positive pole over the affected part, or, conversely, in affections where there is a deficiency in the normal activity, we reverse the electrodes, by applying the negative over the seat of the disease, while the positive is applied at some point remote from it. Thus, we strive to bring about a physiological, natural and normal state of equilibrium.

A simple contrivance shows that the electric current flows from the metal of higher to the one of lower potential, as heat from a higher to a lower temperature, and the same is true in animate bodies as in the inanimate metals. How often have we all noticed that there is a peculiar sensation, or, in fact, a slight shock, experienced when we shake hands with some people, the cause being simply, that the electricity of higher potential in one is flowing over to the other of lower potential. Hence, we infer that the uses of heat may be similar to those of electricity in the cure of disease; in fact, we are using this heat agent vastly more often than electricity, because its character and effects are vastly better known.

WHAT THE BUZZ OF A BEE SAYS.—In a recent work on the bee, T. W. Coman states that the insect can draw 20 times its own weight, can fly more than four miles an hour, and will seek food at a distance of four miles. By a beautiful mechanical adaptation its wings bear it forward or backward, with upward, downward or suddenly arrested course. Its threefold voice organs are the vibrating wings, the vibrating rings of the abdomen, and a true vocal apparatus in the breathing aperture or spiracle. The buzz is produced by the first

two, and the hum, which may be "silly, cheerful or colloquially significant," by the vocal membrane. A number of the bee's notes have been interpreted. "Hummm" is the cry of contentment; "wuh-uh-nuh!" glorifies the egg-laying of the queen; "shn-n-n" is the note of the young bees at play; "s-s-s-s" means the muster of a swarm; "b-r-r-r" the slaughter or expulsion of the drones; and the "tn-tu-tu" of the newly hatched young queens is answered by the "qua-qua-qua" of the queens still imprisoned in their cells.

WILL IRON RUST CAUSE FIRE?—When oxide of iron is placed in contact with timber excluded from the atmosphere, and aided by a slightly increased temperature, the oxide will part with its oxygen, and is converted into very finely divided particles of metallic iron having such an affinity for oxygen that, when afterward exposed to the action of the atmosphere from any cause, oxygen is so rapidly absorbed that these particles become suddenly red hot, and if in sufficient quantity will produce a temperature far beyond the ignition point of dry timber. Wherever iron pipes are employed for the circulation of any heated medium, whether hot water, hot air, or steam, and the pipes are allowed to become rusty, in close contact with timber, it is only necessary to suppose that under these circumstances the particles of metallic iron become exposed to the action of the atmosphere—and this may occur from the mere expansion or contraction of the pipes—in order to account for many of the fires which periodically take place at the commencement of the winter season.

ASBESTOS RUBBER, as it is called, is quite a new article of manufacture, which is fast coming into general use. In its preparation, asbestos and india rubber woven sheeting, for instance, consists of asbestos woven cloth, coated on both sides with india rubber and then vulcanized. It is used as a substitute for the asbestos millboard for packing for steam joints, and in other situations where it is desired to resist both heat and moisture, while affording a high degree of elasticity. Asbestos and india rubber woven washers are also made, and asbestos and india rubber woven tape, for making steam and water joints. Asbestos rolled cloth packing is also made, both with and without india rubber core. Asbestos block packing consists of an india rubber back, upon which there are built up edgewise a number of layers of asbestos cloth. Sufficient elasticity is thus imparted by the vulcanized rubber back, while great durability and protection to the rubber is insured by the use of asbestos.

A NEW ARTIFICIAL STONE, recently devised in Germany, is prepared as follows: Ten parts of silicic acid, powdered and freed from impurities, are mixed with 90 parts of water and 100 of quicklime, all by weight. One hundred parts of the product are mixed with 100 parts of sand and five parts of magnesia or fluorspar, and the mass moulded as desired. The articles are allowed to dry for 12 to 24 hours, and subjected to steam pressure under 10 atmospheres pressure for 48 to 72 hours, after which they are treated with boiling saturated calcium chloride solution at a pressure of 10 atmospheres for 6 to 12 hours. They may then be dried by air or the circulation of steam. Marble, magnesia, magnesium limestone, etc., may be substituted for the sand. The stones thus formed are said to resemble marble, sandstone, granite, etc., closely, to be fireproof, and to resist the action of the weather as well as natural stones.

THE WASTE OF ENERGY IN ARTIFICIAL LIGHT.—The correspondent of a foreign paper, the name of which is lost to the writer, says: "All our lighting methods consist in heating a body to a higher temperature. When a degree of over 500° C. has been reached, the vibrations produced by the heat become visible to our eye as light, red or dark rays. With increasing temperature we finally reach a white light; but what a great amount of energy has been spent and lost! Certainly our lighting methods are very primitive, and it would seem that the electrical light would easily attain supremacy. Of all the energy consumed in a gas flame we get only one per cent returned in the form of light, the 99 per cent being lost as regards light. The electric arc light stands higher in this respect. Still, it only gives us ten per cent back in the form of light, of all energy spent. Surely we cannot be proud of our lighting methods."

THE HEIGHT OF THE AURORA.—Interesting particulars concerning attempts to measure the height of the aurora have been given the Royal Danish Academy by Adam Panlsen. At Godthab, with two theodolites four miles apart, the height of different auroræ was found to range from one-third of a mile to nearly 40 miles. Near Cape Farewell, with a base line of about three-fourths of a mile, the results showed them to range in height from one to 10 miles, and at Spitzbergen, with a base line of about one-third of a mile, they were shown to be from 300 yards to 18 miles high, according to brilliancy. M. Panlsen infers that the aurora only appears at a considerable height in the temperate zone, while in the arctic zone proper the phenomenon is generally produced in the lower atmosphere.

IRON PIERS.—An ocean pier at Puerto-Colombia, near Savanilla, will, when finished, be 4000 feet long, built entirely of iron and steel, with a double line of rails.

ELECTRICITY.

Electricity in Mining.

Much is now being said and done in the matter of introducing electricity into the various departments of mining. On the Pacific Slope, on other parts of this continent, and in various parts of Europe, electrical energy has been largely applied to mining, and in most cases with the most unmistakable success. Perhaps more is being done in this particular direction in England than in any other country, and the subject is largely discussed there in various scientific bodies, and especially in the Institute of Mining Engineers.

Electrical transmission of power constitutes the chief factor in these discussions, and that plan has been adopted in a large number of localities, but generally over short distances only. The recent successful long distance transmission at Frankfurt, in Germany, is attracting still more attention to the subject, and opening much more extended fields for its introduction.

Metalliferous mining in particular, from the very nature of its usual localities and surroundings, is very generally much hampered by long distances over which coal for fuel has to be conveyed or the very unsatisfactory and often expensive substitute of wood employed. When the fact is taken into account that nearly all mining on the Pacific Coast is carried on in the near vicinity of an abundance of water power, the great value of the electrical transmission of that power from the rivers to the mines should become at once apparent.

The improved and more economical conditions under which such transmission may now be made, makes that system peculiarly valuable to this coast, and it can scarcely be questioned but that great numbers of electrical plants of that description will soon be introduced. Such convenient and cheap power will no doubt soon open up many valuable mining properties which are now, for the lack of such means, lying idle and unproductive. When a turbine can, with very little expense, be made a source of almost unlimited power, the advantages of electricity are of great value. The cost, under such advantages, between steam and electricity are very largely in favor of the latter.

The fact that new machinery and new methods for cheapening and facilitating work by electricity are being so constantly brought forward, is no doubt greatly retarding the introduction of this new power; but in this era of rapid progress, it can scarcely be considered the part of wisdom to sit down and wait for the perfect completion of anything. We should rather take up the most improved as soon as we are really in need of it.

The mining engineer of the future and even of the present, who is not also a thorough electrical engineer, will soon be left behind in the race of progress. The time is fast approaching when he who from ignorance or from a lack of proper enterprise and boldness, neglects to take advantage of what is placed before him in the way of progress, will utterly fail of success in every enterprise in which he may engage. In the actual presence of the voluminous contributions of literature and practical development on every economic or industrial subject, there is no excuse for ignorance or uncertainty. This country and this coast even, should, in the near future, become the great practical school of mines for the world. We have here every description of mineral which the world produces, on anything like a large scale, and we should be quick in the future, as we have been in the past, to adopt the newest and most improved methods, and our inventors should be constantly on the alert to devise new and still further improved means. It is confidently expected that professional interest in such matters will continue, as it has in the past, to bear satisfactory fruit in all circumstances under which such efforts may forward scientific advancement or industrial progress in any direction.

Running Railroad Trains by Electricity.

The proposition that long-haul service, on even overland railroads, may soon be accomplished by electricity is fast gaining ground among men who are largely interested in and intimately acquainted with heavy railroad operations. We have now the following opinion on this matter from the President of the Northern Pacific Railroad:

"It is easier for me to have faith in the invention to run railroad trains by electricity than it was ten years ago to believe that it was possible to run street cars in that manner," said Second Vice-President Prescott of the Northern Pacific Railroad Company in a recent talk on Edison's latest device, in which Henry Villard has become interested. "I think it was about ten years ago," said Mr. Prescott, "when Mr. Villard told me that I would see the day when street cars would be operated by electricity. I doubted very much, as it was impossible for me to see how it could be done."

"Since I have seen street cars in operation by electrical appliances, I am ready to believe that it is only a question of time before we will have it on the railroads. The question as to the disposal of the present supply of engines does not cut any figure in the matter and will

not be taken into consideration. If you can get a cheaper motor power than that which you are using, you would not begin to calculate how much money you had expended on the old one, would you? What would we do with the old engines? I don't know. Probably sell them to some one who did not want electricity. If everybody used electricity, it might be hard to find a market for the engines. If no other disposition could be made of them, they could go to the scrap heap; but I don't think the present stock of engines will be sold for old iron."

THE TELEPHONE PATENTS.—Much has been said of late, and much confusion manifested, in regard to the expiration of telephone patents, and the benefit which the public will derive from their expiration. A full and, no doubt, correct statement of all the facts in the case has been put forth as follows: The fundamental telephone patent will expire in 1893, when the simple method of transmission by magneto currents will be open to the public. The practice of extending the term of patents is one which has fallen into disrepute, and nothing is more improbable than that it would be revived in a case like the telephone. The inventor of the telephone has been enriched for his gift to the public, and deservedly so. With this fact established, the chances of extension fall. It must be remembered, however, that the telephone industry of to-day has only attained its present degree of perfection by the coalition of many improvements upon Bell's basic idea. There are hundreds of patented inventions which have been acquired by purchase, which will inure the Bell Telephone Company quite a firm grip on the business for many years after the fundamental patents expire. First in importance are the microphone patents and the induction coil for raising the tension of feeble microphone currents; and, secondarily, numerous switches, switchboards and systems which enable the present company to give good service. A competing company can only offer the public magneto transmission minus these improvements, which, of course, will give only inferior results.

ELECTRICITY AS THE RIVAL OF STEAM.—Dr. Louis Bell, in a paper on "Electricity as the Rival of Steam," before the Franklin Institute, recently concluded as follows: "Probably for a long time to come by far the greater proportion of dynamo will continue to be driven by steam engines, but so far as use at a given point is concerned, the electric motor is a most successful rival of the steam engine. If the day ever comes, as it may, although we can hardly dare to look for it, when we can obtain electrical energy directly from coal, as we now obtain heat energy, the days of the steam engine will be numbered. As I have already pointed out, electricity and heat are very intimately connected. Every time we heat a piece of iron, for example, we stir up not only what we call heat, but also electro-magnetic energy, which is the form in which heat is radiated, and if we go on heating long enough, we may raise the iron to a white heat, and recognize the energy in its familiar form of light. But all this is merely a dream of the future; perhaps it will be fulfilled some day; but until then we must depend upon our present dynamo."

THE FRESNO ELECTRICAL RAILWAY CO.—Articles of incorporation have been entered into by this company and officers elected as follows: Marcus Pollack, president; Dr. Lewis Leach, vice-president; J. R. White, treasurer and Maurice Messinger, secretary. The capital stock is \$1,000,000. The new company has bought the three lines of street railway, and will at once construct 12 miles of electric road in this city. As planned, the road will soon be extended through the colonies and to Hanford, a distance of about 30 miles.

ELECTRICITY IN THE NORTHERN PACIFIC CAR SHOPS.—It is stated that E. B. Pareone, superintendent of construction for the Edison General Electric Light Company of Portland, Or., has just finished installing an Edison plant for the Northern Pacific car shops at the town of Edison. The station comprises four No. 10 Edison dynamos, and about 1000 arc lights, distributed through the various shops and departments. Two turn-tables have also been equipped with Edison dynamos.

NEVADA CITY.—The Board of City Trustees last week awarded a contract to K. Casper, for lighting the streets for one year with the Helmer incandescent electric light system. The plant is to be erected immediately. Gas has heretofore been used.

ELECTRIC LINE EXTENSION.—The announcement has been made that an important extension will soon be made by the Capital City Railway Co. of Salem, Oregon, which will give that city eight miles of electric city railway.

THE MAGNET, equipped by the Pacific Electrical Storage Company of this city, which has been running in San Francisco bay for some time, is, we believe, the first electrical boat built or run upon Pacific Coast waters.

THE POINT DEFIANCE LINE, at Tacoma, has been equipped with electricity, and several electric cars are now running regularly on that road. The electric power is furnished by the Tacoma Railway and Motor Company.

GOOD HEALTH.

Specks Before the Eyes.

Their Sudden Appearance—A Startling but Not Serious Affection.

People are often frightened almost out of their wits by the sudden appearance of flying specks before their eyes; sometimes they are only one or two, but often thousands of them can be seen, particularly when a person looks toward a white surface, as white clouds, white houses, white pavements, or toward water surface. These flying specks are mostly small points, connected one with another by fine lines, and the points often present a headed appearance. At first, persons are likely to try to knock them away, thinking it is something before their eyes. They come usually in both eyes at the same time. They may diminish or increase in numbers at times, but rarely ever disappear entirely. They never interfere with vision by settling over objects looked at.

Dr. A. D. Williams explains, in the *St. Louis Medical Journal*, that the nature of the flying specks here described is not well understood, but badly focused eyes are most likely to be troubled with them. He says that they signify nothing serious so long as they are mere points connected with fine lines, and do not interfere with the acuteness of vision. Treatment is more than useless. If the eyes are out of focus, proper glasses should be selected. It is important that the patient should ignore their presence entirely; should avoid seeing them as much as possible and let them alone. Large floating masses before the eyes, which swim around and often obscure vision, are the result of serious disease, and should be promptly looked after.

CRIMINALITY AS A DISEASE.—"It is my opinion that the time will come when criminality will be recognized as an inherited disease and treated accordingly," said a man who has recently been studying this subject somewhat carefully from a medical standpoint. "Those persons who display in youth a tendency to commit crimes will then be placed in institutions very different in character from prisons, where they will be constantly watched and encouraged to employ their abilities in those kinds of labor for which they are best fitted. In this way society will be saved from the consequences of the vicious instincts of these people. In many cases careful treatment will doubtless cure criminals of their disease and enable them to return to the world and become useful citizens. In others, they will have to remain under surveillance during the whole of their lives. Of course, men and women not afflicted with vicious tendencies at birth will still be subject to temptations, and the law will be obliged to inflict penalties upon them for irregular proceedings; but the large class of inveterate lawbreakers will be recognized as irresponsible for their ill-behavior, just as people afflicted with hereditary diseases are never blamed for misdeeds."

CHANGE OF ACTION BETTER THAN REST.—As for the feeling that we need rest, rest, rest, it is often a fallacious one. It is action which makes muscle. The spirit of life enters into us when we take a vital part in to-day. Often we suffer from rest. A change of occupation is what we most need, as a rule, and the relief hours of an active person turn out to be very intelligent, easy and contemporary. We meet rest, but we must not lose our electricity, which the will, the thought can command at all times, and which ought to be on guard like an orderly, to summon us when we should become alert. Headaches evaporate if we meet exert ourselves for those we love, or we almost forget the pain, which is the same thing; and ill-temper cannot flourish unless we have idleness in which to reflect upon the motives belonging to some one else. With energy leading the way, ennui lifts from the horizon, and we see color and distance again. There are women who labor day by day in hunger and despair. It seems as if other might labor in comfort and health, instead of sitting down to lassitude and elgbe.—*Ex*

RUBBER FOOT FEVER.—If a man has a corn, says the *India Rubber World*, it can be removed, but if he is suffering from rubber foot fever, no chiropodist can help him, and the only thing to prescribe is liberal bathing of the feet and removal of the cause. Rubbers should only be worn to keep wet out, and they should be removed the moment the wearer gets indoors. Failure to note this gives a man wet feet in a far worse sense than if he had waded through mud ankle deep. It was the trouble resulting from forcing the perspiration to soak the stockings and keep the feet perpetually damp that drove rubber-soled boots out of the market. Even loose rubbers are a source of danger and the cause of many more serious colds than they avert.

DISEASE FROM BIRDS.—One of the latest discoveries of the scientists is that the germs of yellow fever may be conveyed from tropical countries in the plumage of birds.

STEEL FOR COPPER.—It is reported that a large steel company is experimenting with a process to render steel efficiently tenacious to enplant copper for the manufacture of rods and wire.

USEFUL INFORMATION.

A CURIOUS MINERAL.—Quite recently a large deposit of what is sometimes known as "foal flour," has been discovered in the State of Maine, and that, too, of such purity as to arouse the wonder of the best analysts. In investigating the properties of this new earth, one is impressed at once by its wonderful facility for resisting the action of acids, alkalis, oils, and especially by its remarkable quality as a nonconductor of heat. A simple test of this latter quality, made by one interested in the company, was to take an incubator of the material and place it on a bar of iron. The iron bar was then put in a blacksmith's forge and heated until it was melted away from the incubator. So little did the heat penetrate this incubator that one could easily place the fingers upon the upper part of it without inconvenience from the heat. Foal flour is almost as white as oxide of zinc. It is so light in weight that a flour barrel of it in its natural condition will not weigh over 50 pounds. It is, as we have already stated, absolutely unaffected or unchanged by any sort of mechanical manipulation, by acids, alkalis or heat. As it is mined, it comes out of the ground a pure white powder, so fine that it cannot be ground any finer. A careful analysis of it shows about 95 per cent pure silica. This kind of earth has been used in Europe very largely for a variety of purposes; one of the most curious of which was in Sweden, where the poorer classes mined it and mixed it with wheat flour, in order to make bulky loaves of bread, not for sale, but for their own eating.—*American Miller*.

REMARKABLE SKILL AT STONE THROWING.—It is supposed that we have no men nowadays who could compete on even terms with the old archers. A man named Uri Bailey, recently died in Pennsylvania, who was worthy of a place with the old-time soldiers. His skill in throwing stones was said to be marvelous. He was mentally deficient, but a giant physically. His aim with stones at any mark or game was as unerring as that of the most skillful handler of the rifle. He annually bagged scores of small game, pheasants, rabbits, quails and squirrels, which he killed with stones. He could kill a bird on the wing or a rabbit at full speed almost as easily as he could kill it at rest. He had a large leather pouch attached to one side of his coat, on which he on all occasions carried a good supply of carefully selected stones. An exhibition of his skill which was always a favorite with him, was to set up a scythe blade, edge toward him, and at the distance of 100 feet out apple in halve by throwing them against the edge of the blade. He could almost exactly halve two out of every three apples he threw. Robin Hood's great feat of skill was to set up a peeled sapling at a considerable distance and split it with an arrow. We do not see that this is more difficult than splitting the apple on the scythe blade.—*Ex*.

PURIFYING GUTTA PERCHA.—Gutta Percha as it comes in commerce is a very rough and crude article. It is reported that a Frenchman has discovered a means for purifying this material which will revolutionize completely this branch of the business. The work has heretofore been done by mechanical operations; while the new method is chemically performed, and while it is a much cheaper process, the results in the gutta percha are much more satisfactory. The raw gutta percha is first dissolved in a suitable solvent and afterward removed by the filtration of the undissolved matter. This solution is then passed into a series of poisoning vessels, and the oxidized gutta percha separated from the pure material by reason of the difference in density. The pure product is drawn off into another vessel, and the bisulphide evaporated. The resulting material still contains resinous products which require to be removed. This is done by dissolving in benzine, when the resin and gutta percha separate, and each may be drawn off separately. The oxidized gutta percha, after being oxidized, is treated in the same manner, forming a product of inferior quality. Electricians, particularly, will profit by this discovery, as gutta percha is a material much used in their profession.

PHOTOGRAPHS, IN COLORS, OF TINTED WINDOWS.—It is said that a Swiss doctor has succeeded, after a long series of experiments, in obtaining photographs of tinted windows in their original colors. His photographs contain red, violet, yellow, green and white. They were sent to Dueseldorf, after passing from hand to hand on the way, and the photographic journals speak favorably of their retention of the colors. These samples were taken in 20 seconds by the midday sun.

A NOVEL WAY TO CUT SHEET BRASS.—Sheet brass may be cut chemically with good success by the following method: Make a strong solution of biiodide of mercury in alcohol. With a quill pen draw a line across the brass where it is to be cut. Let it dry on, and, with the same pen, draw over this line with nitric acid. The brass may then be broken across like glass out with a diamond.

A NEW FIRE EXTINGUISHER is composed of a mixture of water and liquid carbonic acid gas, which, upon being discharged through pipes at high pressure, causes the rapid expansion of the gas, converting the mixture into a spray more or less frozen.

Passing Events.

In mining circles the main topic of interest has been the coming Mining Convention. It is a hopeful sign for the industry that the general sentiment is in favor of giving the miner a better "show" than he has had. There is a very different feeling on this subject now from what there was ten years ago. The State misses the gold it used to have in circulation when the hydraulic miners were at work. If they can show, as they think, that their industry can be carried on without injuring others, the people will be with them in the future.

A large number of Eastern newspaper people are at present visiting California, in attendance on the Convention of Press Clubs being held in this city. They intend making trips to different parts of the State.

In the mining counties, during the past two weeks, many meetings have been held by the miners. They are anxious to have Congress look into the laws and rulings affecting their industry, so that many of the obstacles to obtaining title to mineral lands may be removed.

JAPANESE, to the number of 100, have taken the places of that number of whites and Chinamen at Comox, B. C., in the Union mines. Two hundred more Japanese miners are expected on the next steamer.

Other Objects in View.

There seem to be many who suppose that the only object the miners of this State have in meeting in convention is to bring the hydraulic mining question to the front again, and that only miners interested in surficial gravel will be benefited. This is a mistake. There are several branches of gold-mining carried on in California, just as there are several branches of agriculture. The gravel miners are not much interested in quartz, and those milling quartz have little interest in the hydraulic-mining subject. The people generally have heard so much about hydraulic mines and debris that they have paid no attention to quartz mines, river mines, or other forms of gold-mining.

They are therefore ignorant of the status of the other branches of the mining industry and know nothing of the difficulties under which these are at present carried on. The miners themselves, however, do know what these difficulties are, and are about to appeal to Congress for relief. The swearing off of mineral land as agricultural, by which large tracts of the mineral domain come into the possession of the railroad companies, is an evil not only affecting California, but Montana and other States. Montana has been agitating the subject for two years past, and the miners there have handed together to right the wrong. They have been only partly successful thus far, but have at last obtained a department decision declaring large tracts mineral temporarily until Congress can act. California has this same subject to discuss, and an exceedingly important one it is for certain of the central and northern counties.

Again, the contests between the mineral and agricultural claimants of public lands, from one end of the State to the other, are usually so conducted that the miner gets the worst of the bargain, and it is very difficult for the miner to obtain title to land that the Government really intended to set aside for his use and benefit. By the methods and rulings adopted, the area available to the prospector is being gradually but rapidly narrowed, greatly to his detriment.

During the last ten years the courts and departments have been placing new and restricted interpretations on the mining statutes until the Act of Congress has been practically nullified. By virtue of these decisions and rulings, the requirement now is, that the mineral claim shall be a paying mine; valuable paying mineral must be proven, and prospective values are not admitted.

Under such rulings as this, many of the prominent mines of California, which have yielded millions of dollars could not be legally located and patented to-day. The law contemplated no such a state of affairs.

Then comes the question of obtaining Government title to mineral lands. The red tape and circumlocution with which the process of patenting a claim has become involved is so great that it is almost impossible to obtain a patent. It takes from three to 15 years to get a mineral patent through the departments. Men are permitting the land to go as agricultural and buying it for mining in that shape rather than try to get a mineral patent.

It has been decided time and time again that a department ruling or decision does not make a law; but the practice is such that the decisions and rulings have really taken the place of the plain law itself.

These are some of the subjects which the miners will discuss at the Convention, in addition to that of hydraulic mining. Those who are opposed to the latter industry try to make it appear that the miners only want to get a chance to work those mines again, and that the Convention will consider no other subject. Most of the other industries of the State have had representatives assembled in convention. The miners meet now for the first time. Those who are opposed to them will do well to suspend judgment until they see what is done. It will be time enough for criticism when the miners ask for something unreasonable.

A ZOOLOGICAL SOCIETY.—An attempt will be made at 2 o'clock on Saturday afternoon, in the Academy of Sciences building, to organize a Zoological Society of California. All who favor the movement are invited to meet Dr. H. H. Behr, Dr. Gustav Eisen, Walter E. Bryant, C. A. Keeler and Chas. Friels on Saturday. These gentlemen are the signers of the call.

The Miners' Convention.

On Wednesday next will assemble in Pioneer Hall in this city, the first general convention ever held by the miners of California. As all interested in the matter know, Placer county held a county mining convention and issued the call inviting the other counties to join forces at San Francisco on January 20th, and consider such matters relating to the mining industry as might properly come before them. The idea originated with Thomas B. Everett and J. A. Filcher of Auburn.

The response to the call is very gratifying. All the mining counties of the State will be represented, and it is expected that 400 or 500 delegates will be in attendance. In some counties people known to be inimical to the mining interests have been appointed by the supervisors, but the call for the convention provided for such emergencies and such persons will probably find themselves ineligible.

Other men are represented as prepared to introduce various plans for overcoming the debris nuisance in the rivers, such as steel V-flumes, etc. It is just as well, however, for all such people to save their breath. It is too late to discuss plans. All this ground has been gone over time and time again, and the convention is not apt to listen to anything of the kind.

As to hydraulic mining the plain facts are these: The debris controversy went on for years; the miners were defeated in the courts and their mines closed by injunction. The people began to miss the gold and the State Legislature asked Congress to investigate the debris question. Congress then appointed a Commission to make an investigation and suggest a plan to adjust the conflict between mining and farming sections and rehabilitate the mining industry.

This Commission has reported that dams will impound the heavy debris, and by improving the rivers the waters will care for the lighter material.

Now the miners want Congress to let them build these dams, without danger of courts enjoining the mines after the dams are finished.

This is the sum and substance of all the miners will ask with respect to hydraulic mines. They will ask nothing unreasonable at all. They will give no advice to the engineers or Congress. They simply want Congress to do what it started in to do—settle the conflict by adopting the report of the Commission appointed to adjust it.

More Valuable for Mineral.

"In the case of William W. Lemon vs. Hugh L. Riant, involving a mineral contest in the Marysville (Cal.) district, Assistant Secretary Chandler affirms the Commissioner's decision, holding for cancellation Riant's homestead entry. The land is more valuable for mineral than for agricultural purposes."

The above paragraph, telegraphed from Washington this week, is refreshing in view of the fact that so many cases are being decided the other way, and so much mineral ground is passing out of the prospectors' field.

Assistant Secretary Chandler, on Nov. 2, 1891, in the case of Tinkham vs. McCaffray, decided that "a contestant who alleges the mineral character of the land that is *prima facie* agricultural must show affirmatively the existence of mineral in sufficient quantity to make the land more valuable for mining than for agricultural purposes."

This rule, combined with that which requires proof of a valuable paying mining ground, adds another to those already operating against the mining claimant. These department rules have about taken the place of the law itself, and will so continue until Congress takes the matter in hand and instructs these instructing officials.

The rulings are made by a set of department clerks and underlings in Washington who never saw a mine. They know nothing of the conditions whatever. They expect a man, for instance, to show valuable mineral which is buried under a couple of thousand feet of lava, before his tunnel reaches the deposit. This is a cold fact, as instanced by several recent decisions, and then, with a sort of solemn facetiousness, talk about the "rainbow chasing features of mining" because the miner is running a tunnel for a deposit he supposes to exist, and wants title to the land before he reaches the deposit.

The Miners' State Convention will bring this

matter to the attention of the Mining Committees of Congress and try and bring about a change of procedure.

The Pelton Wheel With Multiple Nozzle.

The cut shown on page 35 represents the Pelton system of multiple nozzle wheels, by which large power is developed from comparatively low heads, and by which also increased speed can be secured, when desired, for running dynamos or other high-speed machinery. The cut shows only four streams but the number can be increased to six or more, the power being multiplied in this way, according to number and size of nozzles, both nozzles and buckets being proportioned to power requirements and water available.

All the streams having a separate and distinct line of impingement, do not conflict, and there is, therefore, no appreciable loss of efficiency. By this means, adaptation can be made to almost any requirement as to power, under heads ranging from 25 feet upward, affording all the advantages of simplicity, efficiency and small cost of maintenance that applies to the Pelton system under higher heads. Each nozzle has an independent gate valve to facilitate regulation and adapt the wheel to varying supplies of water. Where automatic regulation is desired, the valves, by suitable connections, can be all controlled by one governor.

Wheels of this character have been designed for the great Niagara Falls plant of capacity of 5000-horse power each, running under 140-foot head, discharging 24,000 cubic feet of water per minute, which plans were awarded the prize by the London International Commission against all American competitors. This principle illustrates the remarkable flexibility of the Pelton system of power as well as its facility of adaptation to all conditions of volume, speed and pressure.

The Call for the Convention.

We republish as follows the original call for the Miners' State Convention, italicizing a certain portion to which special attention should be called:

The miners of Placer County in convention assembled, hereby issue a call for a Miners' State Convention, to meet in San Francisco, on Wednesday, the 20th day of January, 1892, at 2 o'clock P. M.

The appointment of delegates to said State Miners' Convention shall be thirty (30) from each county in California except San Francisco, which shall be entitled to 60 delegates.

Said delegates shall be elected by a convention of the miners and mining sympathizers, called to meet in each county on or before the first day of January, 1892, for that purpose. Any three or more miners may issue the call for said County Convention.

If, however, in any county of the State, the miners fail to meet and elect delegates, as herein provided, on or before the first day of January, 1892, then the Supervisors may, and they are hereby requested to appoint the delegates to which their respective counties are entitled to in said State Convention.

Provided, that no man who is unfriendly to the mining interests shall be eligible to a seat in said Convention, and where supervisors may appoint they are requested to discriminate in favor of mining men.

The San Francisco delegation has resolved to pay all the expenses of the Convention, that is, for hall, etc. The Convention will meet in Pioneer hall, Pioneer building, Fourth street, near Market.

A Great Tunnel.

The excoavation of the new Croton aqueduct for the water supply of New York city is of interest to miners, owing to the great amount of tunnel work, and the means employed to overcome the difficulties encountered. The Croton watershed is expected to furnish by complete storage, an average daily supply of 250,000,000 gallons. It was at first contemplated to construct the aqueduct in open cut, but investigation showed that the deep outtings would cost as much as a tunnel. This fact and the consideration of the more permanent character of the work, caused the tunnel to be adopted. Eight reservoirs are included in the project.

The total fall from the Croton gate-house to the Central Park reservoir is 34.39 feet. The aqueduct passes under the Harlem river, where the depth of the center line below mean high water is 307 feet.

There are four blow-offs; total number of principal shafts, 32; total number of auxiliary shafts, 10; shafts to be left open, 28. The deepest shaft (No. 10) is 419 feet.

The total excavated material of the entire aqueduct exceeds 2,500,000 cubic yards. The total excavated material plus the masonry placed exceeds 3,250,000 cubic yards. This is equivalent to 83 per cent of the volume of the great pyramid of Cheops. This material would be sufficient to build a wall 10 feet thick and 55 feet high around Manhattan Island, 30 miles in length on the water front. The amount of dynamite used in blasting on the aqueduct, exclusive of the amount used in sinking the shafts, was over 5,800,000 lbs., or over 2900 tons.

The dimensions of the new aqueduct are as follows:

	Feet.	Miles.
Total length of tunnel not under pressure (horseshoe).....	120,370.6	22.80
Total length of tunnel under pressure (circular).....	38,070.8	6.83
Total tunnel, including siphon at Gould's Swamp.....	158,450.4	29.63
Total length of aqueduct in open trench.....	5,926.7	1.12
Total of aqueduct from Croton Lake gate-house to 136th St. gate-house.....	102,377.1	30.75
Total length of pipe line.....	12,516.0	2.37
Total length from Croton Lake gate-house to Central Park gate-house....	174,893.1	33.12

The flowing capacity of the aqueduct, 318,000,000 gallons per 24 hours, is equivalent to a stream 50 feet wide and 10 feet deep flowing 59.1 feet per minute, or about one foot per second, or about seven-tenths of a mile per hour. These facts we take from a paper read before

the American Institute of Mining Engineers by J. P. Carson of N. Y.

The rocks are metamorphic, principally gneiss, which varies from firm granite to ordinary mica schist. About 90 per cent of the

FIG. 1.—LONGITUDINAL SECTION OF AQUEDUCT FROM SHAFT 12A TO SHAFT 12B.

FIG. 2.—SECTION SHOWING BAD GROUND NEAR SHAFT 13A.

FIG. 3.—SECTION BETWEEN SHAFTS 13 AND 14, AS SHOWN BY DRILL-HOLES.

FIG. 4.—CROSS SECTION OF BLOW-OFF CUT.

rock is of this character. It was generally observed that where a brook occurs on the surface, the stratification of the rock below has undergone great disturbance. This is characterized by faults, a jointed structure, and seams of variable size filled with talc, decomposing feldspar and clay. This faulty ground, after a few weeks' exposure to the air, is liable to fall down, by reason of the slacking or swelling of the seams. No interesting mineral specimens were found.

Several pretty bad places were found along the line, and we shall, in a future number of the PRESS, show the methods of timbering employed at such points. To give an idea of the character of the ground, longitudinal sections on the line of the tunnel are shown in Figures 1, 2 and 3, and Fig. 4 is a cross section, taken in the excavation for the blow-off at Ardsley. The longitudinal sections south of shaft B were determined by the diamond drill.

Assessment Notices.

GOULD & CURRY SILVER MINING COMPANY.
Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees, held on the 5th day of January, 1892, an assessment (No. 63) of Thirty (30) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 69 Nevada Block, 309 Montgomery Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 5th day of February, 1892, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on TUESDAY, the first (1st) day of March, 1892, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

ALFRED K. DURROW, Secretary.
Office—Room 69 Nevada Block, 309 Montgomery Street, San Francisco, Cal.

SAN FRANCISCO MILLING AND MINING COMPANY.
Location of principal place of business, San Francisco, California; location of works, West Point, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 12th day of January, 1892, an assessment, No. 1, of Two (2) Cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States gold coin to the Secretary, at the office of the Company, Room 56 Nevada Block, 309 Montgomery Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of February, 1892, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 8th day of March, 1892, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

CHAS. H. OSBORN, Secretary.
Office, Room 56 Nevada Block, 309 Montgomery Street, San Francisco, California.

GRAY EAGLE MINING COMPANY.—LOCATION OF
Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of January, 1892, an assessment, No. 27, of Six (6) Cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room 11, No. 303 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of February, 1892, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 7th day of March, 1892, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

A. W. BARROWS, Secretary.
Office, Room 11, No. 303 California Street, San Francisco, California.

DELINQUENT SALE NOTICE.

CALIFORNIA CREAMERY COMPANY.—LOCATION OF
Location of principal place of business, San Francisco, California; location of works, Novato, Marin County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the second day of November, 1891, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No.	Cert.	Shares.	Amt.
Kaupisch, Julius	3	60		\$2,400 00
Kaupisch, Frank M.	4	60		2,400 00

And in accordance with law, and an order of the Board of Directors, made on the 23 day of November, 1891, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at the office of the Company, 111 Front Street, San Francisco, on MONDAY, the 11th day of January, 1892, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with cost of advertising and expenses of sale. CHAS. MERSFELDER, Secretary.

Office, No. 111 Front Street, San Francisco, California.
At a meeting of the Directors of the California Creamery Company, held to-day, the day of sale of the above delinquent assessment was postponed to MONDAY, February 1st, 1892, at two o'clock P. M., at the office of the Company 111 Front Street, San Francisco, California.
CHAS. MERSFELDER, Secretary.
San Francisco, Jan. 11, 1892.

FRANCIS SMITH & CO.,
Manufacturers of

Sheet Iron and Steel PIPE!

ALL SIZES,

130 Beale Street, San Francisco, Cal.

Iron cut, punched and formed, for making pipe on ground. All kinds of Tools supplied for making Pipe. Estimates given. Are prepared for coating all sizes of Pipe with a composition of Coal Tar and Asphaltum.

W. H. CONLY,
Mining, Commission.

LEGITIMATE INVESTMENTS A SPECIALTY; 331 Pine Street, Room 7, San Francisco; Telephone No. 5057.

DIVIDEND NOTICE.

The German Savings and Loan Society,
528 California Street.

FOR THE HALF YEAR ENDING DECEMBER 31, 1891, a dividend has been declared at the rate of five and four-tenths (5 4/10) per cent. per annum on Term Deposits, and four and one-half (4 1/2) per cent. per annum on Ordinary Deposits, payable on and after SATURDAY, January 2, 1892. GEO. TOURNEY, Secretary.

EVERY one in need of information on the subject of advertising will do well to obtain a copy of "Book or Advertiser," 363 pages, price one dollar. Mailed, postage paid, on receipt of price. Contains a careful compilation from the American Newspaper Directory all the best papers and class journals; gives the circulation rating of every one, and a good deal of information about rates and other matters pertaining to the business of advertising. Address ROWELL'S ADVERTISING BUREAU, 10 Spruce St., N. Y.

If you wish to advertise anything anywhere at any time write to GEO. P. ROWELL & CO., No. 10 Spruce St., New York.

Educational.

PACIFIC ENGINEERING SCHOOL,
121 Post St., San Francisco, Cal.

PRACTICAL, ELECTRICAL, HYDRAULIC, CIVIL, MECHANICAL, AND MINING Engineering, Surveying, Architecture, Drawing, Assaying and Navigation, GRAFPHICS, Drawing and Mathematics for the trades. Send for circulars. Day and evening.

JOHN T. EVANS,
Assay Office and Chemical Laboratory,
Rooms 46 and 47 MONTGOMERY BLOCK, 628 R. Montgomery Street, San Francisco. For nearly 15 years with Thomas Price, as Chief of the Ore-Assay and Analytical Department. Lessons given in Assaying and Chemistry.

School of Practical, Civil, Mechanical, Electrical and Mining Engineering,
Surveying, Architecture, Drawing and Assaying,
728 MARKET ST., SAN FRANCISCO, CAL.
Open all year.

A. VAN DER NAILLEN, President.
Assaying of Ores, \$25; Bullion and Chlorination Assay, \$25; Blowpipe Assay, \$10. Full Course of Assaying, \$50. ESTABLISHED 1884. Send for Circular.

THE PIONEER COMMERCIAL SCHOOL.

PACIFIC Business College,
320 POST ST. SAN FRANCISCO.
Established 1863. Oldest and Best.

LIFE SCHOLARSHIPS, \$75.
NO VACATIONS. DAY AND EVENING SESSIONS.
Ladies admitted into all Departments.
Address: T. A. ROBINSON, M. A., President.

HEALD'S
BUSINESS COLLEGE,
24 POST ST., S. F.

FOR SEVENTY-FIVE DOLLARS THIS College instructs in Shorthand, Type Writing, Book-keeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business for six full months. We have sixteen teachers, and give individual instruction to all our pupils. Our school has its graduates in every part of the State.
Send for Circular. E. P. HEALD, President.
C. S. HALEY, Secretary.

HORACE D. RANLETT,
Ores, Mining, and Commission,
420 Montgomery St., S. F.

Ships under advances to smelting works in Boston New York, Baltimore and Liverpool.
Twenty-one years' experience in Shipping Ores and Managing Mines.
Solely Concernments of Copper Produce and Management of Mining Matters.
All business conducted on Cash Basis.
Purchase and shipment of Mining Supplies A SPECIALTY.
Sales of Developed Copper Mines undertaken.
Business Manager of UNION COPPER MINE, Copperopolis, Cal.; NEWTON COPPER MINE, Amador Co., Cal.

WADE & WADE,
Analytical Chemists and Assayers,
ESTABLISHED 1837—1095 COMMERCIAL ST., LOS Angeles, Cal. We have fitted up the best laboratory in Southern California and are prepared to make Assays and Analyses of all Metals, Minerals, Ores, Waters, Fertilizers, Etc. ASSAYING TAUGHT.

WIRE ROPE
FOR ALL PURPOSES.
IRON AND STEEL WIRE OF ALL KINDS

BULLION ROOMS and ORE FLOORS,

524 Sacramento Street, San Francisco, Cal.

COIN RETURNS ON ALL BULLION DEPOSITS IN 24 HOURS.

WORKING TESTS OF ORES BY ALL PROCESSES.

SPECIAL ATTENTION PAID TO CONCENTRATION OF ORES.

Ores Received on Consignment, Sampled, Assayed, and Disposed of in the Open Market to the Highest Bidder.

ESTABLISHED 1866.

Pacific Chemical Works.

HENRY G. HANKS,

Practical and Industrial Chemist, Assayer and Geologist.

718 MONTGOMERY ST., - SAN FRANCISCO.

Will report on the condition and value of any mining property on the Pacific Coast. Rare Chemicals made to order. Instructions given in Assaying and Practical Chemistry.

BEST'S GAS ENGINE.

A TRIUMPH IN MECHANISM!

THE PATENT CUT-OFF

Makes the Most Efficient Explosion and Gives One-Third More Power than any Gas Engine yet Invented.

STARTS INSTANTLY!

No necessity for an experienced engineer. Neatest in design. Simplest, Best, Cheapest Motor in existence. It costs only 20 cents a day per horse-power. For Farm Use, Pumping, Sawing, Dairying, Elevators and Pleasure Boats.

THIS ENGINE HAS NO EQUAL.

Awarded First Premium under a PONY BRAKE and METER TEST at the State Fair, 1891.

DANIEL BEST,

PATENTEE AND MANUFACTURER,

Send for Circular. SAN LEANDRO, CAL.

The San Francisco Delegation.

The delegates appointed by Mayor Sanderson to represent San Francisco at the State Mining Convention on the 20th inst. assembled on Friday last at the State Mining Bureau. They were called to order by Chas. G. Yale, a member of the Executive Committee of the Placer County Miners' Association, which issued the call for the State Convention. He stated the objects of the meeting, and at the conclusion of his remarks, Robert McMurray was selected chairman and W. C. Ralston secretary. Among the delegates present were: Robert McMurray, S. J. Hendy, B. F. Laoy, Judson Wheeler, F. A. Huntington, J. C. Rend, F. Chappellat, F. Relohling, Thomas Price, J. M. Adams, A. Wallrath, M. W. Belshaw, J. H. Hammond, L. Wagoner, J. O. Whitney, S. Foreman, H. Plohor, E. Charonnat, C. W. Cross, P. Deldeshelmer, C. A. Lookhardt, William Ireland, Jr., C. S. Wieland, W. O. Ralston, S. E. Holcombe, Chas. G. Yale, W. Aug. Knapp and E. P. Meroello.

On motion, Chairman McMurray appointed the following committees:

Resolutions—C. G. Yale, O. W. Cross, Ross E. Browne, E. B. Pond, A. J. Bowie, J. C. Rend, W. C. Ralston.

Reception—A. Wallrath, John Hayes Hammond, Thomas R. Church, W. Ireland, Jr., F. Chappellat, P. Deldeshelmer, E. P. Meroello, S. J. Hendy, F. A. Huntington, J. M. Adams, R. McMurray, W. C. Ralston, C. G. Yale.

Hall—F. Chappellat, W. Ireland, Jr., E. P. Meroello.

Executive and Finance—J. C. Stump, John H. Hammond, Thomas R. Church, H. Plohor, J. M. Adams, E. Charonnat, C. S. Wieland, P. Deldeshelmer, F. A. Huntington.

The Chair stated that 42 counties would be represented in the convention, and that about 400 to 500 delegates would be in attendance. It was necessary, therefore, that the San Francisco delegation should take some action for the reception and entertainment of the visitors.

After some discussion, it was decided that the San Francisco delegation would pay the expenses of the convention. A preliminary assessment of \$5 was then made upon each delegate to defray present expenses.

Mr. Yale, of the Committee on Resolutions, stated that he hoped his colleagues would agree with him on the subject of brevity in the resolutions. There was no necessity of extended preambles and resolutions. They wanted to stick exactly to facts, and leave instances for future consideration.

Since this meeting, some of the committees have arranged considerable of their business. Pioneer hall, in the Pioneer building on Front St. near Market, has been engaged. The chairmen of delegations are requested to go to the State Mining Bureau (in the same building) on their arrival in the city and register the names of their county delegations. The entire San Francisco delegation will act as a Reception Committee.

The Grandest of California's Resources.

Among other letters of encouragement received from beyond the borders of California, relative to the mining Convention of next week, is the following:

To the Hon. J. H. Neff, President, Messrs. C. G. Yale, J. B. Hobson, B. F. Hartley, and John Spaulding, members Executive Committee, Miners' Association of Placer Co., California—GENTLEMEN: It was with a deal of pleasure that upon my return from the eastern portion of this State, I found myself honored with an invitation to visit and participate in the deliberations of a representative body of California mining men in Convention to be assembled under your auspices, at the city of San Francisco, Wednesday, Jan. 20, 1892.

While my official duties are of such a character as must needs preclude the entertainment by me of any hope of meeting with you in person on the occasion set forth, let me, as a miner and firm friend of your cause, extend my sympathy and earnest support in aid of the cause you have in hand.

There can be no question that the primary foundation on which your great State has been built up to its present entrancingly wonderful position, was, first the discovery, secondly the development of her wonderful auriferous deposits of pay gravel, from which for years a golden sustenance of practically incalculable value has been derived by her.

Hydraulic mining removed, by the ingenuity of combined antagonism and legislation, left California minus one of, if not the grandest of, her various resources.

It is my sincere wish that the proceedings of your Convention may be resultant in the return to your State and its people of a source of revenue, theirs by right, and in my opinion their richest natural endowment. With great respect, yours cordially,

GEO. A. BETHUNE,
State Geologist of Washington.

OSCAR MALTMAN who established the Pioneer reduction works in Nevada county in 1858, and conducted them until last year, died in this city on Monday.

Notes on the Conebearers of Northwest America.

NUMBER I.

Two Misnamed California Pinus

OAKLAND, CAL., Dec. 28, 1891.

TO THE EDITOR:—There are two species of pine belonging to our conical closed-cone group sailing under false colors—that is, they are bearing in our present pine literature untenable names. I allude to our familiar Monterey pine and the less-known Narrow Cone pine, called botanically *Pinus insignis* and *Pinus tuberculata* respectively. The first was named more than 100 years ago by one of the earliest settlers to deal with California plants, *Pinus Californica*, and the name was so published, the record standing thus:

PINUS CALIFORNICA, Loiseleur, in Nonveau Duhamel, Vol. V., 243 (1816), with a somewhat faint description to be sure, as follows: "Grows near Monte del Rey, New Albion, North America. The cone is of the form of *Pinus pinaster* [that is, narrowly oblong], but was one-third larger in all its parts; leaves in pairs and triplets; seeds of the size of *P. cembra* [that is, about one-half inch long], and good to eat."

The above name and description was republished, 1844, in London's *Arboretum*.

Following are other names which this species has borne:

Pinus tuberculata, D. Don, in Trans. Linn. Soc. XVII., 441 (1837), (a small-coned form).

Pinus radiata, D. Don, same publication, on page 442 (a large-coned form).

Pinus insignis, Douglas, in London's *Arboretum*, 1844, this name being most frequently applied to the species by subsequent authors.

The name of *Californica*, conferred by Loiseleur Des Longchamps, in 1787 (published in 1816), was accepted by such eminent botanists as London, Endlicher, Hooker and Arnott, Nuttall, Carrère, etc., but was not taken up by most authors of the day, perhaps on account of the error in the description of the seeds, none, no doubt, to mixing of specimens.

However, under the Laws of Botanical Nomenclature adopted at Paris, 1867, and not since repealed, Loiseleur's name for this species must be taken up. Thus reads Art. 49: "An alteration of the constituent characters or the circumscription of a group does not warrant the quotation of another author than the one that first published the name or combination of names." The remark under it reads: "When the alteration is considerable, the words *mutatis characteribus*, or *pro parte*, or *excl. syn.*, *excl. sp. excl. var.* or other abridged indications are added to the quotation of the original author." So the Monterey pine should stand in our literature thus:

PINUS CALIFORNICA, Loiseleur in Nonveau Duhamel, Vol. V., 243 (*excl. charact. seminis*), the character of the seeds only, being incorrectly given.

The treatment of the other species—the Narrow Cone pine—must be more radical, involving the coining of a new name for it:

PINUS ATTENUATA, Lemmon in Herb. This species of pine was described under the name of *Pinus tuberculata*, by Geo. Gordon, in Jour. Hort. Soc. London, IV., 218 and following, (1844) and has generally been adopted by subsequent authors. Mr. Gordon described correctly, and was the first to do so, the Narrow Cone pine, supposing it was the same Don had named, but subsequent examination, as well as Gordon's description, proved that there were two distinct species from nearly the same locality—the vicinity of Monterey bay.

So the name of *tuberculata* for this second species was unavailable, and has been so ever since the distinctness of the species was known.

It seems strange that *tuberculata* being first published for a small-coned form of the Monterey pine (as proved by reference to the figure in Lambert's *Pinus* in the Mercantile library of San Francisco), has been published ever since as a synonym for it without the authors perceiving that, consequently, the name was unavailable for any other species of pine—under the rule of priority.

The name *attenuata* for the Narrow Cone pine which is found sparsely from the Santa Cruz Mts. to the western slopes of the northern Sierra, and beyond in Oregon, is suggested by the long, tapering character of the cones, as well as by the slender habit of the tree when found in groves. J. G. LEMMON.

THE New Mexican coal fields are growing in importance as developments progress. All the five large companies operating at Gallup have consolidated into one corporation under the name of the Crescent Coal Mining Company, with a capital of \$1,250,000, and will probably control all the coal mining of that part of the country. The company owns most of the good lands of the Gallup coal fields.

THE Cerrillos Coal and Railroad Company has been organized in Santa Fe. The charter calls for the building of a railway line, starting at Cerrillos, on the line of the Atchison, Topeka and Santa Fe, and radiating south and west through the coal and mineral fields to San Pedro. This road will open one of the richest coal and mining regions in the west.

THE Union Iron Works of this city have commenced work on a new steamer for the Pacific Mail Steamship Co. She will be 345 feet long, 50 feet beam and be 3550 tons register. The engines are already constructed.

The Most Terrible Volcanic Eruption on Record.

ANTIOCH, CAL., Jan. 4, 1892.

TO THE EDITOR:—Before the year 1883 physical geographers in speaking of the most disastrous volcanic eruption on record, referred first, in point of time, to the celebrated eruption of Vesuvius, in A. D. 79, when the cities of Herculaneum, Pompeii and several smaller towns on the slope of the mountain were destroyed by lava or buried under a mass of pumice stones and ashes; second to that of Hecla and Skaptar Jokull, contiguous mountains in Iceland, in 1783, when two enormous lava streams, one fifteen miles wide and over 100 feet deep and the other scarcely inferior, flowed, the first, fifty miles and the other forty, till they reached the sea, pouring a flood of white hot lava into the ocean, destroying everything in their paths and killing in the waters of the ocean the fish, the mastodons of the inhabitants, who were reduced by the disaster, directly or indirectly, to less than five-sixths of their former strength, and third to that of Galunggung, in 1822, which devastated such an immense area in Java, but all the eruptions known besides were as mere child's play to the terrible one of Krakatoa in 1883.

If the reader will examine the map of the East Indies he will find represented in the straits of Sunda, which lie between Sumatra and Java, the little island of Krakatoa. In maps made before 1883 he will find in vain for the name, for like Bull Run before 1861 it was then unknown to fame, though navigators who passed through the straits knew it as a beautiful tropical isle, with an extinct volcanic cone in the centre. In the beginning of 1883, however, the little well-behaved island showed symptoms of wrath that boded no good to the larger islands in the vicinity. Noted for the fine froths with which it abounded, it was a famous picnic ground for towns and cities even a hundred miles away, and when the subterranean rumblings and mutterings of wrath became ominous to the people of the capital of Java, Batavia, put a steamboat into requisition and visited the island in large numbers. For a time the island was constantly in a slight tremor, and the subterranean roar was like the continued, but distant mutterings of thunder, but the crisis was reached August 23rd, at 10 o'clock, A. M. It was a beautiful Sunday morning and the waters of the straits of Sunda were like that sea of glass, as clear as crystal, of which John in his apocalyptic vision speaks. The beauty that morning was enhanced by the extraordinary transparency of the tropical air, for distant mountain ranges seemed so near that it seemed possible to strike them with a stone cast from the hand. Only the mysterious rumblings and mutterings of the pent up forces beneath the island, disturbed the breathless calm and silence that lay on nature—the calm before the terrible storm—the mightiest, the most awful on record! It burst forth! Suddenly night snatched away day from the eyes of the terrified beholders on the mainland, but the vivid play of lightnings around the ascending column of dust penetrated even the deep obscurity to a distance of eighty miles. This awful darkness stretched within a circle whose diameter was 400 miles, while more or less darkness reigned within a circle with a diameter three times as great. Within this latter area dust fell like snow from the sky, breaking off limbs of trees by its weight miles distant, while in Batavia, 100 miles away from the scene of the disaster, it fell to the depth of several inches. The explosions were so loud as to be distinctly heard in Hindostan, 1800 miles away, and at Batavia, the sound was like the constant roar of cannon in a field of battle. Finally the whole island was blown to pieces and now came the most awful contest of nature—a battle of death between Neptune and Vulcan—the sea poured down into the chasm millions of tons only to be at first converted into vapor by the millions of tons of seething white-hot lava beneath. Over the shores thirty miles away, waves over one hundred feet high rolled with such a fury that everything, even to a part of the bedrock, was swept away. Blocks of stone of 50 tons weight were carried two miles inland. On the Sumatra side of the straits a large vessel was carried three miles inland. The wave, of course growing less in intensity, traveled across the whole Indian Ocean, 5000 miles, to the Cape of Good Hope and around it into the Atlantic. The waves in the atmosphere traveled around the globe three times at the rate of 700 miles per hour. The dust from the volcano was carried up into the atmosphere fully twenty miles and the finest of it was distributed through the whole body of air. The reader doubtless remembers the beautiful reddish or purple glow at sunrise and sunset for fully six months after August 1883—that glow was caused by volcanic dust in the atmosphere interfering with the passage of the sun's rays of the upper part of the solar spectrum, more manifest at sun-rising and settling than at other times during the day, because at these periods the sun's rays have to travel obliquely through the atmosphere and consequently penetrating a very deep layer, were deprived of all their colors except the red.

The loss of life was appalling. The last sight on earth to 35,000 people was that of the awful eruption. Engulfed in the ocean or covered with heaps of ashes, a few hours after the eruption commenced the awful work was done, and that vast multitude had vanished from off the face

of the earth. The fact that in the neighborhood of the mountain there was a sparse population accounts for there not being even a far greater loss of life.

Notwithstanding the awfulness of volcanic and earthquake phenomena, there is some alluring lining to the dark clouds. They prove that the earth is yet a living planet. Centuries must pass away before it will become like the moon—a dead planet—without water, air or life. Our satellite is a prophecy indeed of what the earth must eventually become when all its life forces, its internal energies, are dissipated into space.

GRANVILLE F. FOSTER.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of invention in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

BOOKS ON ASSAYING.

By C. H. AARON.

Part I.—Gold and Silver Ores.

SECOND EDITION—PRICE \$1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes thereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning. The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of Dressing; The Melting in Crucibles; Scorching; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth, 1891. Price, \$1., postpaid. Sold by DEWEY & CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.

Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.

SECOND EDITION—JUST OUT.

Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Notes.

One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc. The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, \$1.75. Sold by DEWEY & CO., PUBLISHERS, No. 220 Market St., San Francisco.

VALUABLE BOOKS ON MINERALS & MINING

A Practical Manual of Minerals, Mines and Mining. Comprising suggestions as to the localities and associations of all the useful Minerals; full descriptions of the most effective methods of both the qualitative and quantitative analyses of each of these minerals, and hints upon the various operations of mining, including architecture and construction. By Prof. H. S. Osborn, LL. D. Illustrated by 171 engravings. 8vo, 367 pages. Price, \$4.50.

A descriptive circular giving the full contents of the above book sent free to any one who will send his address.

A Treatise on Metalliferous Minerals and Mining. By D. C. Davies. With 143 illustrations. 12mo, 482 pages. Price, \$5.00.

Mine Drainage. By Stephen Michell. 8vo, 277 engravings. Price, \$6.00.

A Treatise on Earthy and Other Minerals and Mining. By D. C. Davies. With 76 engravings. 12mo. Price, \$5.00.

The Prospector's Hand-Book. A Guide for the Prospector and Traveler in search of Metal-bearing or other valuable Minerals. Illustrated. 12mo. Price, \$1.50.

Mineralogy Simplified. Easy Methods of Identifying Minerals, including Ores, by means of the Blow-pipe, by Flame Reactions, by the Spectroscope, and by Humid Chemical Analysis, based on Von Kobell's Tables for the Determination of Minerals, etc. By Henry Erni, M. D. Illustrated. 12mo. Price, \$3.00.

Underground Treasures; How and Where to Find Them. A Key for the Ready Determination of Minerals within the United States. By James Orton. Price, \$1.50.

The above or any of our books sent by mail, free of postage, at the publication prices, to any address in the world.

Our New and Revised Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our other Catalogues and Circulars, including a List of Recent and Standard Works on Metallurgy, Mineralogy, Mining, Assaying, and Chemistry, sent free and free of postage, to any one in any part of the world who will furnish his address.

(ESTABLISHED IN 1855.)
Office, 213 Fremont St., San Francisco.

TUSTIN'S PULVERIZER.

MARINE ENGINES AND BOILERS.—Propeller Engine, either High Pressure or Compound, Stern or Side-wheel Engines.

MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engine and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.

MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.

Tustin's Pulverizer

WORKS ORE WET OR DRY.

ENGINES AND BOILERS

OF ALL KINDS,
Either for use on Steamboats or for use on Land.

Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries
OF EVERY DESCRIPTION.

Boiler Repairs Promptly attended to and at very moderate rates.

JAMES LEFFEL'S

Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing. Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case. Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

Engraving.

SHEET IRON PIPE

IRON PIPE

ALL SIZES, FOR GAS, STEAM AND WATER. — WE MANUFACTURE — SHEET IRON AND STEEL PIPE, ALL SIZES. For Water Supply, Mining, Irrigating Purposes, Stock Ranches, Etc. Made in Lengths Desired from 16 to 30 feet. The Out shows a Section of Three Joints DOUBLE RIVETED SHEET IRON PIPE. In the manufacture of this Pipe, we use only a high grade of annealed Charcoal Iron of great tensile strength. The weight or thickness of metal used, is graded according to service required, and pressure to which the Pipe will be subjected. FOR ALL UNDERGROUND PURPOSES, we immerse the Pipe in a bath containing a special mixture of ASPHALTUM, BITCH and PETROLEUM, at a Temperature of 300° Fahrenheit. It thus receives a thorough coating, both inside and outside, rendering it impervious to the alkalies of the earth, rust, etc., and is practically indestructible.

CORRUGATED IRON, Black, Painted and Galvanized, for Roof and Sides of HAY BARNS, DRY HOUSES, STABLES, ETC.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Jan. 14, 1892.

The past week shows a slight increase in general trade. Quite a thorough canvass among iron workers and business men in general, develops the fact that a more cheerful and confident feeling seldom, if ever before, prevailed than is now prevalent. The feeling is grounded on confirmed advices of a largely increased acreage seeded to grain, active railroad building and other internal improvements, an almost certainty of a resumption of hydraulic mining, more attention to deep mining, an easy money market, and last, but by no means the least, seasonable rains for agricultural purposes and heavy deposits of snow on the mountain ranges. Of necessity the situation at the East is also taken into consideration, which never before was so promising.

This is witnessed in the latest returns of the estimates by States of the area, product and value of principal cereals in the United States for 1891 have been made by the Department of Agriculture. It is given out that the crops of corn, wheat and oats, including all but two or three per cent of the cereal aggregate, have been reported. The aggregates are as follows: Corn area 76,205,000 acres, product 2,000,154,000 bushels, value \$836,436,000. Wheat area, 30,917,000 acres; product 611,780,000 bushels; value, \$593,473,000. Oats, area, 25,582,000 acres; product, 736,394,000 bushels; value, \$232,312,000. The aggregate of all cereals is the largest yet produced, and will supply from 54 to 55 bushels per unit of population. The wheat supply is the largest ever reported in proportion to the population. It will average 9.4 bushels to each person, against 9.2 for the largest previous crop in 1884. The average value to the farmer is 40.6 cents for corn, 83.93 cents for wheat, and 31.46 cents for oats.

The above gives the largest money values to farmers ever before recorded, and as they are the bone and sinew of general prosperity, it seems as if the ground work could not possibly be better. The large crops will net to the railroads largely increased gain in earnings, which will bring into life more active times in all branches of trade directly or indirectly dependent on them.

QUICKSILVER—Receipts the past week aggregate 239 flasks. The market is steady at \$47, with a reported light call ruling.

MEXICAN DOLLARS—The market is irregularly weak at around 74 cts. The gradual decline in silver causes Chinamen and other exporters to China to confine their purchases as much as possible.

SILVER—The local, Eastern and foreign markets have settled to lower figures. The decline is evidently due more to manipulation through press news and in other ways, than to any unfavorable change in the situation. Our advices from the East are confirmatory that Congress will act favorably on a free coinage bill, but confining it to the output of the mines in this country. The bill will probably allow depositors of bullion, either gold or silver, the option of taking coin, or else treasury notes redeemable in coin. The bill may also provide for free and unlimited free-coinage, provided certain favorable steps are taken by leading European Governments. Our advices are also confirmatory of a strong probability that a bill will pass calling an international monetary congress. All now points to something being done at this session so as to keep the silver question from being a factor in the Presidential election this year.

BORAX—Receipts aggregate 424 cts. The market is steady, with fairly free shipments being made Eastward.

LIME—Receipts are light; they only aggregate 2341 bbls. the past week. The Hawaiian Islands are drawing more from us.

LEAD—The market is steady. The East reports the market essentially unchanged.

IRON—Imports the past week aggregate 50 tons from New York. The local market is strong, with a large consumption. English advices report a stronger market, due to lessened stocks in the face of lighter exports. Eastern advices, while indicating a seeming movement toward more steadiness, report irregular quotations.

TIN—Imports the past week aggregate 280 pigs from San Diego, and 5500 boxes of plate from Liverpool. The market begins to show signs of more business in plate soon. New York reports an irregularly dull market. London cables to the *Iron Age*, January 7th, are: "There has been more inquiry for tin plate, chiefly from San Francisco, without much actual business resulting. Terns and lower-grade charcoals are in rather better request."

COPPER—The market is firm but quiet. The prevailing opinion appears to be that the market struck bottom in last November. New York mail advices note continued sales at strengthening prices. Holders appear to exhibit more faith in the market. Lake was quoted at 11c to 11 1/2c and casting brands at 10 1/2c to 10 3/4c. London cables to the *Iron Age* report as follows:

In price of merchant bar copper there has been a rise to £47 7s 6d for prompt delivery, followed by reaction of about 15s. The stronger tone and advance in price were due partly to speculative buying, some of which is said to have been for account of a French clique, but good consumptive demand helped the market. The decline during the last few days was due to somewhat heavy realizations by speculative holders. Sales of furnace material during the past fortnight include 200 tons Montana matte at 9 shillings per unit. Visible supply decreased 29 tons, and spot stocks 549 tons last month.

COAL—Imports the past week aggregate as follows: Glasgow, 4876 tons; Liverpool, 10,567; sharpness, 1000; Cardiff, 2435; New York, 250; Greenock, 2600; Newcastle, N. S. W., 5548; Nanaimo, 2302; Tacoma, 2250; Seattle, 6190; Swansea, 2722; Departure Bay, 5712; Comox, 4100; total, 59,541. Notwithstanding heavy arrivals and the scarcity of yard room, the spot market holds up well. Cold weather has stimulated the consumption of house coal, while steam coal shows no falling off in consumption. It now looks as if we will have cheap coals throughout 1892. This opinion, of course, is based on a large acreage seeded to wheat and uniform favorable reports received from the stands. All now depends on the spring rains.

Mining Share Market.

Comstock mining shares the past week were more active under the leadership of Belcher. The liveliest movements were in the Gold Hill shares, although the Middles scored a slight advance, but the up move in the latter was only a flash in the pan. The activity in Belcher's shares is claimed to be on an improvement in the mine on the 1300-foot level. Seeing that the MINING AND SCIENTIFIC PRESS as far back as February, 1889, reported a connection on that level between the Belcher south drift and the Seg. Belcher north drift, so as to show up the rich ore known to exist to the west; the new (?) find is rather stale. But then it is better to report it late than never, even if it is a forced proceeding, due to a contest for control of the mine. Perhaps the management is playing the virtuous act to win, if possible, the confidence of shareholders, so as to carry the annual election of officers, and if successful, then continue through some kind of hocus-pocus assessments for the public and spoils for the rings. The management in showing up the west lode and starting up the mill on paying ore looks very much like a practical illustration of the old saying that when the evil one got sick he forewore his evil ways, but when he got well he returned to them with renewed vigor. The general feeling is that the present management will retain control of the mine, and after election sell off their holdings and levy an assessment. While this is the general impression yet there are a limited few who have confidence in the stability of the movement. Time will only tell which is correct. The mine, if properly managed, ought to be paying dividends.

Outside mining shares, the past week, were flat, stale and unprofitable, with transactions outside of the Bodie few and far between. Toward the close, the Quifoots were stronger. The "Razor Blade" or Tuscarora pool appears to be playing a waiting game, that is, make their stocks active when the Comstocks come more to the front.

Is there an annex to the mill that is reducing Con. Virginia ore? If there is not, then why are car sample assays not given by the superintendent in his weekly letters. John W. Mackay, while testifying in M. W. Fox's suit against the Hale and Norcross directors, said that car sample or mine assays are a check against mill owners, for it prevents them from getting away with bullion that rightfully belongs to shareholders in the mines. In the above suit it was proven that through the annex fully one-half of the assay value of the ore went to others than outside shareholders in the mine. If the directors of mines wish to be above even the suspicion of being dishonest, they should insist on their superintendents giving car sample assays, and also conforming to all else required by the mining laws of this State under which they are incorporated. Obey the laws is all that is required, and any fight in court or otherwise to evade them does not look as if the mine is being managed honestly.

About a year ago M. W. Fox, as owner of 19 1/2 feet of the Savage Mining Co.'s ground, brought suit against the directors for an accounting, and also alleged that there was overcharge for milling, besides general mismanagement. Judge Sanderson, before whom the suit was brought, has decided against Fox and stated that he had other means of securing his rights, as the suit should have been brought in Nevada. It is to be hoped that the case will be appealed, so as to settle forever several disputed points.

The Supreme Court of this State, in the suit of Manuel Eyre against the directors of several of the mining companies, upheld Judge Hunt's decision that in making the monthly statements a balance sheet or general statement conformed to the laws, but said that the judge erred in striking out that part of the complaint requiring full detailed reports weekly by the superintendents of the mines, and therefore referred the case back for a new trial. Rather than stand a new trial, it is said that the defendants settled with the plaintiff. This is proof positive of the correctness of the PRESS in its contention that superintendents do not obey the law, and in not doing so the directors are personally responsible. Give the mine or car sample assays.

At the third annual election of the Mining Stock Association on Wednesday, Dr. W. N. Griswold was reelected Pres. and John H. Tingman Sec'y. Mr. Tingman was elected Treasurer in place of Coll Deane, deceased. The old Executive Committee, with M. W. Fox chairman, was reelected. Mining shares opened this (Thursday) morning firm but inactive. The points out are for lower prices. The only stocks that appear to show any life are the six that the combination of brokers in the S. F. Stock Board Exchange are forcing the managers to buy so as to retain control. This morning Sierra Nevada showed more life.

A. G. Gurnett says that the brokers' combination, organized to force mine managers to buy their stock so as to control the mines, is meeting with unqualified success. They are now at work on Sierra Nevada, owing to its annual election coming first.

News from the Comstock mines continues to improve. What is allowed to leak out inevitably due to fears entertained by the rings of the combinations against them. In looking over back reports of official letters from the Belcher, we find that in December, 1890, a west crosscut was started from the 1400-foot level, and that in February of 1891 an upraise was commenced from the end of the crosscut to connect with the 1300-foot level. The raise was carried up to connection all the way in ore. Our advices from the mine, report that they followed a small streak of rich ore from the Seg. Belcher line northward and then started to raise on it, and that the ore has widened to six feet. It now looks as if they may show up the ore body to the west, but there have been so many deceptions in the past that very few have confidence in the present work being carried out for the interest of outsiders. In the other Gold Hill mines, important work is still being pushed, with much of it of secret character. The news from the middle mines grows more important as active developing work is pushed. The same remarks apply to the north end mines. The Alta mill has shut down, and pumping is resumed, possibly to freeze out shareholders.

From the outside mines our advices report that Peer ore milled, went over \$28 per ton battery assay. A bullion shipment is on the way. In Peerless, they are getting into the downward continuation of ore found above. Bulwer's ore the past week milled over \$41 per ton. In Bodie they are following small

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

ALCYONE G. AND S. M. Co., Jan. 8. Capital stock, \$10,000,000. Directors—W. A. Keeper, John C. Quinn, Edward Lander, William B. Murdoch, John T. Evans, Eugene N. Deuprey and J. D. Whitney.

AMERICAN CAP CO., Jan. 8. Object, to manufacture detonating powder and caps. Capital stock, \$250,000. Directors—Geo. P. Thurston, Wm. P. Morgan, Samuel Rodgers, Wm. J. Casey and James P. Pierce.

ALASKA PACKING CO., Jan. 13. Capital stock, \$4,000,000. Directors—E. B. Pond, Chas. Hirsch, Sidney M. Smith, H. F. Fortmann, G. W. Hume, E. B. Beck, S. B. Peterson.

PACIFIC COAST ALUMINUM CO., Jan. 13. Capital stock, \$1,000,000. Directors—A. G. Sneath, F. A. Rich, Thos. Archer, Wm. Tappenbach and H. Thompson.

HOPPER ALUMINUM CO., Jan. 13. Capital stock, \$1,000,000. Directors—Andrew J. Hopper, Valentine I. Gadesden, Paul R. Jarboe, Wilberforce R. Moned, John R. Jarboe.

WHITE HORSE VALLEY MILL & LUMBER CO., Jan. 13. Capital stock, \$500,000. Directors—Charles Slasky, Henricus Graf, Wolrad Winterberg, Louis Cooks, Edmund Godchaux, N. Steiner, John Curran.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

- FOR WEEK ENDING JANUARY 5, 1892.
- 466,319.—GLOVE FASTENER—Wm. H. Bell, S. F.
- 466,453.—FRUIT-CUTTING MACHINE—John Burns, Los Angeles, Cal.
- 466,521.—PIPE COUPLING—Wm. L. Fitts, San Jose, Cal.
- 466,674.—WEED PULLER—Gatgens & Dowdin, Central House, Cal.
- 466,675.—VEHICLE SPRING BRACE—S. J. Graham, Colville, Wash.
- 466,538.—VEHICLE SPRING—J. Heilrath, Plymouth, Cal.
- 466,526.—GRAIN AGITATOR FOR SEPARATOR SHOES—C. A. Kelley, Ripon, Cal.
- 466,716.—THRILL-COUPLING—L. C. Rasmussen, S. F.
- 466,378.—IRONING TABLE—G. N. Simmons, Santa Cruz, Cal.
- 466,471.—CONDUIT FOR ELECTRIC RAILWAYS, C. P. Tatrow, Spokane, Wash.
- 466,731.—POWER MECHANISM—G. O. Vernon, Albany, Or.
- 21,286.—DESIGN FOR WATER-WHEEL CASING, A. P. Brayton Jr., S. F.

The following brief list by telegraph, for Jan. 12, will appear more complete on receipt of mail advices:

Charles Buckner, San Francisco, zipper; James J. Culley, San Francisco, cuff holder; Robert H. Dixon, Santa Rosa, pruning implement; C. F. Gillett, Corvallis, Oregon, potato planter; Samuel N. Goldy, San Francisco, wash balance; Andrew S. Halldie, San Francisco, clip for rope tramways; Emory I. Nichols, San Francisco, pulverizing mill; F. H. Elephar and A. Renard, Chehalis, Wash., stump extractor; John R. Russell, San Francisco, ore feeder; Augustus E. Scharf, Tacoma, Wash., brake for children's carriage.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

GRAIN AGITATOR FOR SEPARATOR SHOES.—Chas. A. Kelley, Ripon, San Joaquin Co. No. 466,526. Jan. 5, 1892. This invention applies to separators, including the ordinary thrashing machines and the combined harvesters. It consists in combination or connection, with the shoe of the separator, of a revolving agitator above said shoe, the object of which is to lift and stir up the material upon the surface of the sieve, thereby affording the wind a better opportunity of blowing away the chaff

and straw, and allowing the grain to pass through the sieves or riddles. The object of the particular construction of the agitator is to keep the material from packing or bunching on the sides of the shoe, and to agitate and throw it upwardly to the center, where another portion of the agitator acts upon it to keep it in motion, and allow the wind to more effectually separate the chaff and straw.

PIPE-COUPLING.—Wm. L. Fitts, San Jose. No. 466,521. Dated Jan. 5, 1892. This improved means of coupling pipes together consists of two collars into which the outwardly turned and parallel flanges of the adjacent ends of the pipes to be coupled are fitted, guides by which these collars are brought together with a certain relation to each other, and a lever mechanism fulcrumed to one of the collars and acting against the other, whereby the two parts are drawn and locked together. It also consists in a means for regulating the tension or pressure by which the parts are held together.

CAR-COUPLING.—John C. Look, San Jose, No. 465,987. Dated Dec. 29, 1891: This is one of that class of car-couplings in which the drawbars have hooked heads, with the hooked surface vertical to the plane of the car, and acted on laterally by springs which press the hooks in together, it being of that type known as the "Miller coupling." But the most novel construction consists in having a yielding guard-bar opposite the hook; the guard-bar is pivoted to the car underneath, and extends out in the same direction as the drawbar, and is pressed inwardly toward the hook by a spring. The drawbar and guard-bar are held apart by a brace, which may be fastened to either of them, and leaves just enough space for the opposite hook-head. The springs are so arranged in connection with a stop that the hook is held in the middle of the car when uncoupled. The drawbar has a pivoted-hooked head, with a locking lever held by a spring-pressed pawl in the drawbar, and a chain and bar extending to the side of the car to unlock the pawl, a buffer arm extends out on the hook side of the drawbar to meet the opposite coupling head. A platform buffer constructed in a novel manner, is also connected with the coupling. The coupling is automatic in all positions in which it may be left, both as a coupler and buffer.

RUPTURE. PILES and all Rectal Diseases POSITIVELY CURED, in from 30 to 60 days, WITHOUT OPERATION OR DETENTION FROM BUSINESS. ALSO ALL NERVOUS, SKIN, BLOOD, PRIVATE AND CHRONIC DISEASES OF BOTH SEXES. STRICTURE AND URINARY TROUBLES CURED. No charge unless cure is effected. Consultation free. Call or address for pamphlet. DR. PORTERFIELD & LOSEY, 833 Market St., San Francisco, Cal.

MINING AND SCIENTIFIC PRESS. The Leading Mining Journal in America. Established 1860. Latest Discoveries in Science and Improvements in Mining and Mechanic Arts Illustrated or Described. A Standard Illustrated Weekly published at \$3 a year by DEWEY & CO., 220 Market St., San Francisco, Cal.

ELECTRICAL ENGINEERING CO.,
— MANUFACTURER OF —
Dynamos and Electric Motors
FOR THE TRANSMISSION AND DISTRIBUTION OF POWER

Manufacturer of and Contractor for the Installation of all Kinds of
ELECTRIC APPARATUS.

The Dynamos and Motors manufactured by this Company develop the highest mechanical efficiency; they require little or no attention, are almost noiseless, and run with an entire absence of sparks at the brushes, rendering the daily trimming of brushes unnecessary.

Electric Power Apparatus for Quartz Mills, Hoisting, Pumping, Drilling, and all Mining Work, where Long Distance Transmission is desired, a Specialty.

Office and Works, 21 & 23 SPEAR ST., San Francisco, Cal., U. S. A.

F. A. HUNTINGTON.
PATENT ORE FEEDER. CENTRIFUGAL ROLLER QUARTZ MILL.

This Feeder is especially designed to feed the Huntington Roller Quartz Mills; it is simple in construction, and while in motion can be easily adjusted to feed fast or slow; it has but few wearing parts and its positive movement makes it the best Ore Feeder now in use.

The Following will Explain the Above Cut:

The ore and water being fed into the mill at the hopper A, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

F. A. HUNTINGTON,
— MANUFACTURER AND DEALER IN —
STEAM ENGINES AND MINING MACHINERY OF EVERY DESCRIPTION.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 2000 IN ACTUAL USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

THE PELTON WATER WHEEL CO.

121-123 MAIN STREET, SAN FRANCISCO, CAL., U. S. A.
143 LIBERTY STREET, NEW YORK, U. S. A.

PELTON WATER MOTORS. Varying from the fraction of 1 up to 40 and 50-horse power, unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. Address as above.

THE GATES ORE AND ROCK BREAKER.

UNLIMITED IN CAPACITY. UNEQUALED IN EFFICIENCY, UPWARD OF 3,000 NOW IN USE. Will do more than twice the work of any other with the same cost in wear. Gives a fineness of product that increases the capacity of any mill from 25 to 40 per cent without any additional expense. THE BEST AND ONLY CRUSHER ADAPTED TO MACADAM ROAD WORK. Send for Circular.

It having come to the notice of the undersigned that their patent rights are being infringed upon, intending purchasers are hereby warned that all such infringements will be duly prosecuted. (Signed) THE PELTON WATER WHEEL CO.

THE PELTON WATER WHEEL CO. 121-123 Main Street San Francisco, General Western Agents.

DIAMOND ROCK DRILLS.

For prospecting Mineral Veins and Deposits, Boring Vertically, Horizontally, or at any angle to any desired depth, taking out a Cylindrical Section or Core the entire distance, showing exact character, and giving a perfect section of the strata penetrated. Also for Boring Artesian Wells perfectly straight, round and true.

Machines for Channelling, Gadding and other kinds of Quarry Work, Shaft Sinking, Tunneling, Mining, Railroad and all classes of rock-boring. Manufactured by

THE AMERICAN DIAMOND ROCK BORING CO.,

15 CORTLANDT STREET, NEW YORK.

P. O. Box 1442.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Concentrating Belt manufactured in San Francisco; we can therefore fill all orders on short notice. The length and width of these belts are the same as is used on the Frue or Triumph Concentrating Machine, but can be made of any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers, thus the vibration and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

PAT. OCT. 25, 1881.

PERFECT PULLEYS

First Premium Awarded at Mechanics' Fair, 1884.

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

Manufactured under Patents of April 27, 1880;

September 18, 1883; July 24, 1888;

and March 31, 1891.

Price of Plain Belt Frue Vanner, \$575, f. o. b.

Price of Improved Belt Frue Vanner, \$825, f. o. b.

Practical Matte-Smelting.

Exposition of the Principles and Practice of an Important Art.

MINERAL, IDAHO, Jan. 9, 1892.

TO THE EDITOR:—Matte-smelting for the extraction of gold and silver from their ores is of German origin, but by the ingenuity of a few American metallurgists, it has been so changed from the previous foreign practice that we can safely claim it as an American process. Its principal distinction is that it is preeminently suited for the treatment of base ores, particularly sulphuretted varieties, and, generally speaking, all such ores as are or were classified as "refractory" or "rebellious," which are so easily treated by matting that those once used words have now lost their force and application. Nothing is too difficult for matte-smelting, and such substances as sulphur, antimony, arsenic, etc., which give great trouble in other modes of treatment are not only of no detriment in matting, but are actually, to some extent, of great use therein. The valuable metals which can be extracted by matte-smelting are gold, silver, platinum, copper, nickel, cobalt, and, less perfectly, lead. A large number of the so-called "rare" metals also come down. The percentage saved is rarely less than 90, and usually somewhat more. The saving of gold is the most perfect, and in carefully conducted work, is probably equal to the assay valuations.

WE FORM TWO SUBSTANCES IN MATTING, The slag and the matte. The latter contains the valuable metals united in a homogeneous mass of a specific gravity of above five, with sulphur and with more or less iron, lead, etc., according to the composition of the ore. The slag contains silica united with various oxides of the ore, or flux, principally oxide of iron or manganese, lime, magnesia, baryta, etc., none of which we desire to save. The proportion of matte to slag to secure economical results should be from one-tenth to one-fortieth, according to circumstances. It is in maintaining the proper ratio between them that the greatest skill and judgment are demanded, for it can easily be understood that if the proportion of matte is too large it will be too poor in valuable metals, and while the extraction may be excellent the matte will not pay so well for its subsequent treatment at the refinery. But on the other hand, if the amount of matte be small, say one-fortieth of the weight of the ore smelted, it will stand any reasonable subsequent charges for shipping to the refinery, and the commercial success of the operations will be great. Those who have an inkling of smelting will understand at once that the amount of sulphur in the smelting charge governs the amount of matte formed in the furnace. Experience in lead-smelting applies equally here, and we may also apply the rules for the formation of the slags practiced in the latter art, only that a much larger variety of slags are permissible in matte, than in lead-smelting. Thus, for instance, the bisilicate slags, found objectionable in the latter, give excellent results in matting, and for certain classes of ores are indispensable. In lead-smelting, as is well understood, the silica contents of slags vary, as a rule, from 26 to 40 per cent, while in matting we often make slags as high as 50 per cent silica, and even more acid ones have been used to advantage. This is an overwhelming advantage in case of siliceous ores.

Following is a list of the commonest constituents of gold, silver, copper, lead, nickel and cobalt ores, and the reader will understand from it whether or no the matting process is suited to any particular ores in which he may be interested, because the list is arranged with reference to the smeltability, if I may coin the word, of the different elements and compounds named, those that are the easiest to get rid of coming first in the list and proceeding successively to the more difficult ones. Thus, lime is easier to eliminate than magnesia, which in turn is usually regarded as less objectionable than baryta.

TABLE OF ORE CONSTITUENTS.

1. Water.
2. Lead as carbonate.
3. Iron and manganese as carbonates.
4. Iron and manganese as oxides.
5. Lime carbonate.
6. Fluor spar.
7. Dolomite.
8. Magnesia carbonate.
9. Baryta carbonate.
10. Gypsum.
11. Lead as sulphate.
12. Lead as sulphide.
13. Iron pyrites.

14. Other sulphides of iron (and manganese).
15. Compound silicates of the alkalis and alkaline earths.
16. Compound silicates containing alumina.
17. Simple silicates.
18. Heavy spar.
19. Quartz.
20. Zinc in oxidized compounds.
21. Zinc blende.
22. Titaniferous iron.

It is understood that this list refers only to the behavior of the above substances in a blast furnace. If we use a reverberatory matting furnace, as is sometimes done, the reactions are different and we would have to rearrange the table. Furthermore, the lay reader should bear in mind that there is no single one that contains all of the above substances, nor is it necessary that it should, for although an ore containing all of them in the proper proportion would be very easy to smelt, we can get quite as good results from one of a much simpler composition. The simplest ore, or mixture of ores, that we could treat in a blast furnace would have to contain (besides the valuable metal whose extraction we sought) sulphur, oxide of iron, and silica. Some of the iron would be reduced in the furnace and would then join the sulphur and form the matte, taking down the values. The remaining oxide of iron would combine with the silica and form slag. But arsenic and antimony serve the same purpose as the sulphur, and manganese acts the same as the iron; so neither iron nor sulphur are indispensable, though practically they are always present and perform the most important part in the reactions, always excepting silica, which we cannot do without. A large number of other substances are commonly present and perform more or less important parts, going into the slag or the matte, and serving sometimes a good purpose, sometimes a vicious one, according to the chemical reactions which are desired. From what has been said, it will be understood that the matting process has a

GREAT RANGE OF ADAPTABILITY.

For there are, it is safe to say, no mining districts in the world where these simple requirements cannot be met. Almost every mine produces sulphur in the form of sulphides, and some form of iron, or substances which take its place, and silica is almost the universal accompaniment of gold and silver ores. A custom smelter in South Dakota treats quartz carrying less than \$20 per ton in gold and silver, purchasing a quantity of iron pyrites to form the matte, and makes it pay, although the limestone flux necessary to slag so much silica actually weighs more than the ore! In this case the matte contains, besides the gold and silver, only sulphur and iron, while the slag, almost equally simple, contains only silica, lime, and a little magnesia and iron. The experience at this works, where 150 tons per day are smelted, proves that it is possible to smelt ordinary gold quartz at a profit—a thing never attempted before, and vastly beyond the conceptions of most men, who regard smelting as prodigiously expensive and only fitted for what have always been known as "smelting ores." One great establishment in Colorado treats a still larger amount of ore, purchasing with avidity everything offered, particularly such refractory ores as the lead smelters refuse as too difficult, and pays large profits, while competing against every known form of reduction process. At an establishment in Montana, where gold ores are treated by matting, the so-called pyritic process is in use, the distinguishing feature being the employment of iron pyrites, not only as a flux, but as a fuel!—a most valuable and interesting discovery, full of promise for the future. At Mineral, Idaho,

THE WORKS OF THE PORPHYRY COMPANY.

Under the writer's charge, deals with far different ores, which are of the rare kind known as self-fluxing, containing the necessary constituents for successful matting, almost without the use of fluxes—a remarkable feature. Beyond the high percentage of extraction which we attain and the complexity of our slags, and particularly of our matte, there is not much to say, unless it be that our operations are technically and commercially successful. A difference between our practice at Mineral and that of the South Dakota establishment is that, while we have just enough silica, the other concern has too much, and has to flux enormously to offset it. On the other hand, a smelting works (The Willows Syndicate) at Pretoria, South Africa, illustrates the other extreme of having neither silica nor sulphur in their ore. They have to flux with river sand to supply silica, while antimony, which is contained in the ore, serves as a substitute for sulphur, and their smelting goes on very well, forming antimonide of copper, the

so-called "speiss," instead of matte, which answers perfectly in taking down the silver.

Between the extremes, of all silica on the one hand and all base on the other, almost all valuable ores lie, and their treatment would, other things being equal, be less expensive than those of either the South Dakota or the South African establishments; while the variety of possible slags would probably be much greater. I spoke of the former works fluxing its ore with limestone; at another locality it might very possibly be cheaper, and it is quite feasible to flux it with oxide of iron or manganese or with baryta, or in certain cases even magnesia might do, especially if the reverberatory furnace were in use. In fact, it would be difficult indeed to name a gold or silver-bearing ore which we don't know how to smelt thoroughly and economically, and almost impossible to suggest a locality where we cannot adapt the matting process successfully. If we cannot melt the ore by itself, we can always add something else which we call flux to enable it to be melted, and if we can't use one style of furnace, we can another, and as I shall show, we can accommodate the process also to whatever kind of fuel there may be available. Before proceeding further with the discussion of the adaptability of matte-smelting to particular ores, we will consider the different

STYLES OF MATTING FURNACES.

The most work is nowadays done in large rectangular water-jacketed blast furnaces, three feet by eight or ten, at the hearth, with from 10 to 16 tuyeres, which are blown by huge pressure blowers, No. 6 or larger, with a blast pressure of eight ounces, and above. Such furnaces are driven at their very highest capacity, making campaigns of months, with a regular daily record of 100 tons and upward smelted. The South Dakota smelter treats 150 tons daily in a single furnace. At Butte, Montana, matting copper ores, even a larger capacity has been attained. A lead furnace of the same size would smelt about half as much.

An ordinary lead furnace water-jacketed makes a very good matting furnace, with a slight change of the bottom, costing but a few hundred dollars. The other apparatus of the lead plant requires no change unless it be increased blowing power. Smaller stacks than those mentioned are often used for matting, but the large ones are more profitable and easier managed and kept in order. A large blast furnace skillfully handled and provided with sufficient ore to enable long campaigns to be made, is by long odds the best dividend-paying plant in the world. The gross output of a single furnace may foot up a million dollars in a year.

However desirable the blast furnace in its present very efficient form may seem to us, we are not confined to its use should the character of the ores or fuel appear to be a bar to its successful employment, for the reverberatory does quite as good work within its sphere, and is capable of treating a greater variety of ores for there are many mixtures that cannot be handled in a blast furnace, but will be found well suited for the other furnace, and between the two there is no known mixture which we cannot smelt successfully and with a high extraction of the valuable metals.

THE QUESTION OF FUELS.

Almost every combustible can be utilized in matting. As a usual thing only coke and in charcoal are burned in the blast furnace, but late experiments show that bituminous coal and even wood may, to some extent, take the place of the more expensive fuels. At the Harrison Reduction Works, Leadville, coal is used along with coke. At Mineral, owing to the high price of coke (\$25 per ton), we replace half the allowance of coke with fir wood in large blocks and find quite a saving. Anthracite coal is very satisfactory in the furnace wherever it is cheap enough. The reverberatory is usually fired with bituminous coal, but wood is used successfully in many places and wherever gas-firing is practical almost any fuel is good enough. Thus, sawdust can be used in the gas-generators, or coal screenings, culm or other cheap fuel. The quantity of fuel burned per ton of mixture smelted in the reverberatory is about one-third the weight of the mixture, while in the blast furnace it varies from one-sixth to one-ninth only, showing a great advantage for the latter form of furnace. But this advantage is usually offset by the superior cheapness of the reverberatory fuel. To go into a detailed comparison of the two forms of furnaces would be foreign to the objects of this letter so we will dismiss the subject, again endeavoring to impress upon the reader that each furnace has its peculiar advantages and by their instrumentality we are able to successfully smelt any description of gold, silver, copper, nickel, lead, cobalt, arsenic, an-

timony or platinum ore that has ever been seen, or that can be imagined.

AVAILABLE FOR ANY ORES.

No ore nor complication of ores is too difficult for the matting process, and furthermore we are not obliged to expend any time or money in experimenting to find out just how to work any proposed combination; for by the simple agency of chemical analysis we are enabled, even before our furnaces are built, to decide upon the details of our proposed plant and the composition of our products. We know by the same means what amount of flux we shall have to add, and the capacity of our works in tons per day of our predetermined mixture. A process that gives such a control of future operations as this is surely superior in so far, to such as the silver lixiviation methods, where the most skillful metallurgists have to spend months in adapting their process to particular ores, and so far as I can see, never get beyond the experimental stage. It is the fashion in the mining districts to erect reduction plants which are not suited to the ore. It is also the fashion to own and work mines which have little or no "pay" in them. The two causes have produced a vast number of metallurgical (and, worse, financial) failures, and a great many more or less expensive lixiviating, amalgamating, concentrating and smelting works are idle and decaying. But I do not think that any matte-smelting works ever met with failure from inability to work the ores, though it is true that a scarcity of available ores will act as prejudicially to this method as to any other. As might be surmised, it requires a large and regular supply of ore to bring out all the advantages of any method of ore treatment, and matting is no exception to the rule. Especially in the use of the large blast furnaces do we feel its truth, and in case of a limited supply of ore it would most generally be advisable to adopt the reverberatory system.

COMPARISONS AND CONCLUSIONS.

Leaching, as applied to raw silver ore, is a failure; but as an auxiliary to matte-smelting it is of extreme usefulness. We can treat our mattes on the spot by roasting and then lixiviating by various solutions, separating silver, gold, copper, etc., according to the composition of our matte. If only gold and silver be present in an iron matte, the work is not difficult. Should there be a proportion of copper and it be desired to save it, the operation becomes more complicated, and very possibly beyond the resources of any small establishment.

We would not in general expect to make a complete separation of the values, working, as we probably should, in a rather crude and rough way; nor is it necessary that we should, for in every case the residues from such leaching would be returned to the smelting furnace, and whatever of value remained unextracted would be again taken up by the matte. Perhaps no process for gold extraction has ever been worked up to a higher pitch of perfection than the chlorination practiced in the quartz-mining regions of California, and, considering the character of the material, which consists of fine concentrates of nearly pure iron pyrites, with a little quartz sand, and considering also the high percentage of extraction attained by the process in vogue, it would seem that no smelting method could ever successfully supplant chlorination in those districts like the counties of Nevada and Amador, where it is chiefly practiced. But although fuel is very dear in those regions, and the requirements of smelting are otherwise difficult of attainment, I do not hesitate to say that it is as much as 15 tons daily of concentrates could be secured, matte-smelting, followed by chlorination of the product, would prove cheaper, and at the same time more reliable and thorough than chlorination alone, and, besides, the plant would cost less. The advantages of matting would become, of course, still more apparent if a notable quantity of silver were present or if the material treated contained talc, carbonate of lime, or other substances prejudicial to the creation of chlorine. An immense excess of fuel has to be used to obtain the "dead roast" desired in the chlorination of concentrates as at present conducted—enough, in fact, to carry out the matting process and fuse the ore in properly constructed furnaces. The same thing is often seen in roasting silver milling, an example of which I saw at the Yesso mill in Mexico, where, in treating 20 tons of ore per day, as much hard wood is burned as would serve to matte the ore, which is heavy spar, along with sufficient siliceous sulphuretted ore to flux it, the total expense of which operation would be about half of what it costs to treat the ore as at present.

ADVANTAGES FOR SMELTING.

No one who has attentively read the preceding paragraphs can fail to recognize such

ore as possessing certain advantages for smelting. Any mixture whatever that can be fused either by itself or in connection with other ores is in so far a smelting ore; and if the other conditions of smelting are present in a reasonable degree, the metallurgist would have no difficulty in deciding upon a smelting process. For example: The ore of the Santa Lucia mine in Honduras contains:

Lead, 5 per cent.
Zinc, 7 per cent.
Sulphur, 5 per cent.
Lime, 20 per cent.
Alumina, 6 per cent.
Magnesia, 2 per cent.
Carbonic acid, 13 per cent.
Silica, 29 per cent, with 90 ounces silver.
That of the San Francisco Del Oro mine,

preferably one familiar with the practical application of the process, for advice and information. The writer offers his services in this respect free of charge. Average specimens should be sent by express, prepaid, with full information as to quantity of ore, kind and cost of available fuel, fluxes, labor, and water supply. Analyses of carefully taken samples, if such have been made, will invariably be of great use in deciding upon a process. I should add that no part of the process as carried on at Mineral is patented, and therefore no obstacle exists to its adoption in that regard. The same thing is true as to its use in every other establishment in the United States, excepting that at Toston, Montana, where the modification properly known as pyritic smelting is practiced, this being patented. The average

A Great Aqueduct.

We are doing many original things in irrigation engineering in California. Some of our reservoir dams are the greatest of their kind in the world and involve novel principles and methods of construction. Some of our flumes and ditches which conduct water both for mining and irrigation, are peerless for ingenuity in location and ways of building and support. Still, for grand irrigation works California doffs her hat to India and the California irrigating purse shrinks when compared with the British Government treasure-houses which have been freely opened to bring water upon the arid wastes of Southern Asia.

The great public works for irrigation are of much interest to our people, and for this

Nadrai aqueduct, all the railway and road bridges below it were also destroyed, and many villages swept away.

The proportion of the foundation to the superstructure of the new Nadrai aqueduct can be gathered from the fact that three-fourths of the expenditure of money and time were consumed by what is now hidden below ground.

The foundations consist of 268 circular brick cylinders or wells, as they are always called in India, all sunk 55 feet below the river bed. There are 15 bays of 60 feet, divided into three groups of five each by abutment piers. The abutment piers consist of a double row of 12-foot wells, spaced two feet apart, and the ordinary piers of a single row of 20-foot wells similarly spaced.

The wells are all sunk through a stratum

A GOVERNMENT ENGINEERING WORK IN INDIA—THE NADRAI AQUEDUCT—PERSPECTIVE VIEW LOOKING UP THE CANAL.

THE NADRAI AQUEDUCT—PANORAMIC VIEW OF THE DOWNSTREAM SIDE.

Mexico, contains:

Zinc, 24 per cent.
Lead, 12 per cent.
Iron, 7 per cent.
Calc. spar, 10 per cent.
Sulphur, 21 per cent.

Insoluble, 21 per cent, with 30 ounces silver; and finally the ores of the gigantic Huanchaca mine in Bolivia carry:

Copper, 7 per cent.
Lead, 12 per cent.
Zinc, 17 per cent.
Iron, 13 per cent.
Sulphur, 21 per cent.
Silica, 23 per cent.

Yet ores like these, which contain such a preponderance of bases that they are, in some degree, self-fluxing, and have even been characterized by an eminent metallurgical authority as "metallurgical fuels," are to-day made the subject of experiment as to their fitness for lixiviation, a process for which their complexity eminently unfits them.

EXAMINATION OF ORE SAMPLES.

Probably enough has been said to enable those unacquainted with the practice of smelting to understand its principal requirements, and to enable the fitness or unfitness of a given ore to be recognized. In case that there should be doubt concerning the applicability of matting to such ores, it will in all cases be advisable to refer average specimens to some experienced metallurgist,

amount of ore daily subjected to the matte-smelting process in the United States reaches the vast total of 2250 tons, of which some three-fourths are copper ores, but containing an important amount of gold or silver. The remainder are strictly gold and silver ores, but containing in most cases a little copper, a metal formerly supposed to be essential to the process, but which is shown by later experience not to be so.

HERBERT LANG.

MINES AND PROSPECTS.—There is a tendency among capitalists to overlook mining as a source of wealth and field for investments, simply because they are unacquainted with mining matters and mining as a business. They look upon mining as a question of luck only, being ignorant of the fact that "mines are made," in ninety-nine cases out of a hundred, and not found. Claims require capital to make mines of them. It is estimated that it costs \$20 a foot to sink a shaft or drive a tunnel. A poor prospector has a claim that has splendid indications, but he is stuck—the \$20 to sink the one foot is lacking, let alone the means to sink 200 to where treasures await his enterprise and pluck. It is rarely that he can secure help, for capital is afraid of the mining business; and yet an investment in good properties is sure to yield enormous returns.

reason we present in this issue engravings and text description of one of the largest irrigation works of its kind in the world which has been but recently completed. We are indebted for the facts to *Engineering*, an English journal. They show what can be done in handling water on a large scale where ample money is provided, and good professional skill is engaged.

The structure is known as the Nadrai aqueduct. The lower Granges canal, whose water this aqueduct carries over the Kali Naddi, was designed as an extension of the Upper Ganges canal, conceived and constructed by Sir Proby Cantley about the time of the mutiny, and was opened in the year 1876. In the year 1888-89, the Lower Ganges canal had 564 miles of main line and 2050 miles of minor distributaries, and irrigated 519,022 acres of crops. From this it will be seen how important a line of irrigation this canal constitutes, and how urgent the reconstruction of the aqueduct was. The new aqueduct replaces one of much smaller size, viz., five spans of 35 feet, which was damaged by a high flood in October, 1884, and completely destroyed by another high flood in July, 1885.

The Kali Naddi, for the greater part of the year, is a very insignificant stream some 50 feet in width only, but on the date mentioned, it was swollen into a river a mile wide and in places 25 feet deep.

In addition to the construction of the

of stiff yellow clay, averaging 15 feet thick, into a substratum of pure sand. The wells are all hearted with hydraulic lime concrete filled in by skips, and in each pier the wells, by corbeling out the brickwork, are joined together for the superstructure of the pier.

The total quantity of well-sinking was 15,019 lineal feet, or nearly three miles, and was executed by hand and steam-dredging. It was commenced in May, 1886, and completed in May, 1888. The arching was commenced in November, 1888, and finished in April, 1889.

The well-sinking and arching went on night and day, the work being lighted by ten arc lights of 2500 candle power each.

Now that the aqueduct is completed, it forms a most striking object in the vicinity, and will, *Engineering* hopes, stand to bear witness in far distant ages to the beneficence of British rule in India and to the skill of English engineers.

The solidity of the great arches and piers and the fine sweep of the bastion-like wings all unite to give an idea of vast strength and stability, while the monotony of such a large surface of facade is relieved by the effect of light and shade obtained by the bold corbeling out over the spandrels to form a support for a roadway on either side of the canal, and the long horizontal lines of the cornice and railings are broken up by a tower at each end and one at each of the abutment piers.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

GOLD MOUNTAIN.—*Ledger*, Jan. 16: This quartz claim at Quartz Mountain, under the able supervision of Mr. Farwell, is giving every indication of proving a valuable paying property. The ten additional stamps are in working order, making 20 stamps operating on the vast mountain of quartz comprised within the limits of the claim. The success of this enterprise—and its success is now looked upon as placed beyond the range of doubt—means a great deal—more, perhaps, than the development of any other single mine along the main belt. It is off the mother lode, at least 2½ miles to the east; but nature has piled up an enormous mountain of quartz, upon which a number of claims have been located. And the importance of the profitable operation of the Gold Mountain mine consists not merely in the working of that property, but also in the impetus and encouragement it will give to the opening up of the other locations.

KEYSTONE.—Twenty-five stamps of the mill are kept running steadily. The old Hendy concentrators have been taken out and replaced with five Woodbury concentrators, which are sufficient to handle the tailings from the five batteries.

MISCELLANEOUS.—It is reported that C. T. Crocker of Fitchburg, Mass., has bonded or purchased the M. M. Culbert claim at Rancheria. This mine is near Quartz Mountain, and on the same range as the Gold Mountain and other claims there.

Butte.

STANDARD GOLD CO.—*Oroville Register*, Jan. 14: The above named quartz mining company of Oregon City has recently begun operations upon the Cambria shaft. It recently opened what was known as the Bloomingdale shaft, and has yet three other mines to develop. From the present pumping and hoisting works, however, all of the other mines can be reached, so that it is the intention of the company to put in a four-stamp mill to crush what quartz is taken from the mine as the incline is cleaned out and new rock reached. This will effectually test the ore, and if it proves as satisfactory as it now looks, a ten-stamp mill will be erected in the near future. A. T. Graner is superintendent of the mine, and pushes work in the most lively manner.

INSKIP.—*Cor. Oroville Mercury*, Jan. 15: Our mining interests are a little dull on account of the snow. Most of the miners are taking their vacation. Messrs. Rooker & Lacy are drifting on the Great Euclid quartz claim and have struck good prospects. In the spring, they expect to put up a small mill and are talking of incorporating. J. W. Beese is taking out quartz, and hopes to make a good run. Pat Coffey is also taking out quartz, and in the spring will commence crushing. Messrs. Cory and Davis are working their placer on Williams ravine.

El Dorado.

A GEORGETOWN STRIKE.—*Republican*, Jan. 14: A letter received from Georgetown this week says that E. B. Gitchel has struck a bonanza and is taking out about \$400 a day in his ranch with one sluice box and a pan. One piece that he found weighs \$1011.50. Up to Monday he had taken out about \$3000. He is very accommodating, and stacks his large specimens out on the bank, permitting any one to examine them. Gitchel found the gold accidentally while turning some water for agricultural purposes on his ranch about a mile and a half from Georgetown toward Georgia slide. The gold is in the red soil of a small ravine, and only a few feet from the surface. It is the debris from a worn down quartz ledge, there being a little quartz attached to some of the gold, and broken quartz scattered through the soil. Another piece was found weighing \$400. The big nugget is now in the possession of Mr. Barklage of Georgia slide.

AGRICULTURAL STRIKE.—*Mt. Democrat*, Jan. 16: Edward Holmes and E. B. Gitchel at their ranch near Georgetown, on Friday of last week, while ground sluicing dirt from a hillside to fill up some land in which to plant clover, washed out a piece of gold worth \$1025. We are informed that during Friday and Saturday they took out about \$3000. There is no telling the extent of this agricultural streak, which, if it should pan out at the same rate for a few months, would yield quite a harvest.

Humboldt.

ORLEANS.—*Blue Lake Advocate*, Jan. 15: The mines have an abundance of water and are all running, and times on the river are therefore good.

Inyo.

MARBLE.—*Cor. Inyo Index*, Jan. 13: The Inyo Marble Company is making extensive improvements in their quarry at Inyo. A large lot of machinery for cutting the marble economically and in desirable shapes was received from the East a few days ago, while lumber for erecting the necessary boiler and engine-house has also arrived. Mr. Pidge, the Superintendent, states that they are busy getting out material for tiling the demand for which is increasing. With the new machinery, this Company's business will receive an impetus it well deserves.

Mariposa.

COULTERVILLE.—*Cor. Mariposa Gazette*, Jan. 16: The Thyra mill is running all the time now, with good prospects. I am informed that the ore is very rich in gold and sulphurates; the rock is so full of sulphurates that they have to use three concentrators in order to save them. If that is so, there must be a large quantity of them, as the mill is only a five-stamp one.

Nevada.

OSCEOLA MINE.—*Grass Valley Telegraph*, Jan. 13: Some parties in Grass Valley have secured a lease of the Osceola mine, near Rough and Ready, and intend working the same. Years ago the Osceola was owned by a party of Frenchmen, we believe, and a fine ten-stamp mill was built on the property. Sam Locke was at that time superintendent of the mine. But very little development work was done on the property and, for some unknown reason, the company quit work. The Grass Valley parties who have leased the property from Messrs. Huntress and Schroeder are now cleaning out the old tunnel and have found a new ledge, which shows gold freely. The croppings all along the ledge pan out quite flatteringly, and indeed it looks as though the boys were going to have a good thing.

THE HERMOSA.—The owners of the Hermosa mine are just now feeling quite confident that they have at last reached the goal for which they have long been striving—at the bottom of the shaft, which is 425 feet deep, a ledge over one foot in thickness has been found. The ledge shows free gold and is filled with mineral. A miner who went down the shaft to-day, tells us that the Hermosa looks better now than it ever did before.

THE HARTERY.—*Grass Valley Telegraph*, Jan. 15: Thursday the hoisting and pumping machinery of the Hartery Company was set in motion. Some time ago the plant was removed from the old location to the present one, on the Roach ground, and, as is not frequently the case, the machinery worked to perfection immediately on starting. The shaft on the Roach ground is down 150 feet. The company propose to sink 100 feet farther, and if developments at that depth warrant, to commence drifting; if not, to attain necessary depth.

A RICH STRIKE.—Messrs. Cole and Williams, who have been working a ledge just above Washington, struck it very rich Wednesday. The ledge is a large one, being about five feet thick, and is full of gold. The strike is regarded as one of the best ever discovered in the Washington district.

NORTH BANNER MINE.—*Grass Valley Union*, Jan. 14: The mill of the North Banner mine, which has not been crushing for several weeks, will start up again to-day. The work on the 500 level is now going on regularly, the drift being extended north and south from the shaft, as the water, which has been more or less troublesome for several months, is now under control. The vein is opening up in good shape and yielding a fine quality of ore, and the working force of the mine is being gradually increased. The work of making an upraise from the adit level to the surface, is making favorable progress, and when completed the ores will be raised directly to the surface. The company will make important surface improvements during the present year, to add to the facilities of working the mine and handling the ores.

Plumas.

JOHNNY BULL MINE.—*Plumas Co. Bulletin*, Jan. 14: Since shutting down their mill late in the fall, the owners of this property have been energetically at work running their main tunnel ahead, and a new body of ore has been developed. Crusing will be resumed on Monday next, with the prospect of a continued run, as this property is so situated that the storms of winter do not interfere with the progress of work upon it.

SAVERCOOL.—The prospecting work that has been constantly under way on this property is said to have recently opened up a fine ore body and it is reported that the mill will resume crushing as soon as the season opens. Pat Maloy of Bucks Ranch is in town, on his way to Reno, there to conclude a sale of a half interest in his mine to Comstock capitalists. They have made him an offer, and he has concluded to accept it. His mine, the "Needed Wealth," is three miles northwest of Bucks Ranch, on Bucks creek, and it was discovered about 18 months ago. It can be tapped 800 feet deep. The ledge is from six to ten feet wide and prospects well. It is well located for a water power mill. August Goehle of Crescent has purchased the half interest of his partner, Will Roedde, in their placer claim on Rush creek, paying him \$1000 therefor. This mine can be worked for a few weeks only each season by water from the melting snow, but is said to have yielded over \$3000 a year. It is said to be definitely concluded that a mill will be erected in the spring upon the McIntyre-Warren ledge at Wolf creek. The owners of this property have been working upon it for several seasons, and the construction of a mill will prove their faith in its value.

BROWN'S HILL MINES.—*Oroville Register*, Jan. 14: Paul Willett and James Wheeler of Brown's Hill were in town on Tuesday, and from them we obtained some items concerning the mines in that locality. Brown's Hill is across the line into Plumas, but the miners come this way to do their trading and transact their business. At present there is too much snow to do much work, but when spring opens there will be a large number of mines opened and developed. Among these will be the gravel mine of Wheeler, Bills & Co., the quartz ledge of James Wheeler, and another owned by George Wheeler. Mr. Willett lacks only about one week's work of striking his ledge in the tunnel that he has been running. He has no snow sheds up on the outside, so he cannot work any more till spring. Mr. Wheeler tells us that this ledge is so rich that in any part of it the work will yield considerable gold by pounding up the ore in a hand mortar. There will be 12 or 15 mines developed here next summer.

San Diego.

BANNER AND JULIAN.—*Sentinel*, Jan. 14: The mill of the Banner Mining Co. has been quiet now for several days, awaiting ore. Bob Walker and partners are employing their time

with profit upon their fine property, the Chaparral. The owners of the Empire mine at Banner have improved their property by putting a new track and car in place, thus rendering easier their work of development. The rush of assessment work is now over. Several properties, some of considerable value, have changed owners since the first of the year, by reason of failure to comply with the law in this particular. James Lowe and partner, Morris, are doing swimming work upon their contract in Helvetia. They are clearing out the drifts of the old works and timbering well as they go. Considerable ore is coming up the shaft, upon which the stamps employ their time as long as they have water.

Shasta.

FROM IGO.—*Cor. Shasta Courier*, Jan. 16: At the Crystal a drift has been run north about 35 feet, and 60 sacks of ore were shipped therefrom. Sinking has been resumed, and they are now down about 16 feet below the tunnel level; the ledge showing excellent ore all the way. A drift run on the ledge a few feet east of the one now being worked shows some shipping and considerable milling ore. Some work is also being done in searching for the back or west ledge in the lower tunnel. The Eubank ledge has materially improved, and they have made one small shipment. W. D. Bull has been timbering and covering his shaft, and is now in shape to work in wet weather. He has about several tons of fine ore. Robinson & Son have been doing assessment work lately. One shipment has been made since my last. The returns were satisfactory, and more will be shipped when the weather permits. Wright & Sons' ledge is looking as well as ever. The water has been troubling them some the past month. The snow closed the arrastres down for a week or more, but all are gridding again. Shirland's on Pacific, E. L. Ballou's on Falls, and Moody's on Continental ore. W. O. Cooper is sinking on the Chico below the tunnel level, and getting some fine ore again.

Siskiyou.

GOLD DUST.—*Yreka Journal*, Jan. 15: The miners on Cottonwood creek will undoubtedly take out considerable gold dust this season, on account of having a good supply of water from the snow on Siskiyou mountain, to keep the streams and ditches supplied until late in the summer. The snow is melting just right to be of great benefit. Two years ago we had as much snow, but it was dissolved too rapidly by warm rains, so that but little work could be done until late in the spring, owing to streams being too high for miners to manage them. Lee, Lash & Co. at Greenhorn blue gravel mine were prevented by the late heavy snow storm from moving their steam pumping and hoisting machinery to the new shaft, and commenced washing over old tailings with an abundant supply of water. The tailings from the ground worked at their old shaft has been paying handsomely, and they have immense quantities which they piled up for this express purpose. Quinne, the electric light man, will soon make preparations to raise water for a ditch to be built on the side of the high ridge northwest of the town of Hawkinsville, four miles from Yreka. There is no doubt of the existence of a large extent of very rich ground on the foothills and on the flats, never before worked for want of water, much of which is owned by James Quinne and George Simms. The McCoy Brothers bought a claim in that locality in the '50 period from A. E. Schwatka for \$1000, and for some time after opening realized at the rate of 15 pounds of dust or \$3000 every day. We see no reason why there should not be considerable more rich ground at and near the old McCoy diggings. Rodgers & Co., who purchased the upper Greenhorn ditch, heretofore used at the Chinese hydraulic claim just north of town, have extended it to Canal gulch, some two miles farther north, where they are now using the water on rich diggings lying dormant for want of water to sluice with. The company have expended about \$1400 in the extension.

NEVADA.

Tuscarora District.

COMMONWEALTH.—*Times-Review*, Jan. 15: Joint raise from south drift extended 22 feet in the vein, giving low assays.

NAVAJO.—South drift, 350-foot level, extended 13 feet, giving low assays in the face. An intermediate drift has been started below the 350-foot level, progress eight feet, vein small but very rich.

NORTH BELLE ISLE.—No. 4 north drift on the south 500-foot level extended 22 feet; the vein is of good size and is showing considerable heavy sulphuret ore.

BELLE ISLE.—Work has been resumed in No. 1 winze, 350-foot level. No. 1 vein, north intermediate drift on No. 2 vein, below the 350-foot level, extended six feet, showing some rich ore. The stopes are without much change.

NORTH COMMONWEALTH.—Second level: Stopes above the level continue about the same, yielding seven cars first class ore, assay \$290 per ton, and 55 cars second class, \$35 per ton. Winze is down on inclination 45 feet, with some good ore mixed through the vein. Started west drift to cut the winze ore body on the level.

NEVADA QUEEN.—Fourth level: West cross-cut raise extended 12 feet, showing spar with spots of ore. Joint raise at the lode extended 22 feet in vein formation giving low assays.

DEL MONTE.—Second level: Stopes being opened on the line of North Commonwealth show improvement; extracted seven cars first class ore, \$256 per ton, and 42 cars second class, assays \$35 per ton; nine tons of ore shipped, assays \$226.

Lida Valley District.

RICH ORE FROM LIDA.—*Walker Lake Bulletin*, Jan. 13: J. Goldner brought into Candelaria last week some yellow chloride ore, from the Florida mine at Lida Valley, the property of

Len Martin, which, if the fortunate owner only has enough of it, will make him rich in a short time. Prof. Storch made an assay of it which went 4217 ounces of silver to the ton. The ore was obtained at a depth of 60 feet from the surface, at a point newly opened, and distant about 50 feet from any other point where ore had previously been found. Mr. Martin is now taking out ore for shipment.

Osceola District.

HYDRAULICKING.—*Nevada Transcript*, Jan. 14: The Osceola hydraulic mine, superintended by J. H. Marriott of this county, is located a little over the Utah line in Nevada. The company have kept their plants and sluices running nearly all the past season. The cleanup has not as yet been made public, but it is said to be quite satisfactory. The company own two fine ditches, 16 to 19 miles long, each having a capacity of 2500 miner's inches, and giving water enough to keep miners at work from early spring until frost closes the streams in winter. Some 15 to 20 men are employed. The gravel bar on which they are operating has been prospected over hundreds of acres, and its yield is estimated at 17 cents in gold per cubic yard, but in operating, it has run as high as 25 to 50 cents. Between two and three hundred thousand cubic yards can be washed out annually now, the company having provided themselves so well with water. In the beginning of the washing of this bar it was thin, but it now has a breast 100 feet high, on which the monitors play with a water pressure of 225 feet, and enough water is used to run the bed-rock flume, which is four feet wide and four feet deep, full most of the time. A dynamo run by water power supplies the electric lights for night work. The company also own a number of good quartz lodes, a quartz mill and ranches in the vicinity. The gold found in these bars is in the form of small grains up to nuggets weighing six pounds, a large one having been found lately worth over \$2000, and which is a mass of pure gold mixed with quartz.

ARIZONA.

CROWNED KING.—*Prescott Courier*, Jan. 11: Word comes from the Crowned King mine that N. C. Sheekels is running the mill day and night, has a good force of men working in the mine, and is turning out large quantities of rich ore. The camp is quite lively. The Crowned King is one of our biggest bonanzas, and the *Courier* is glad to know that it has started in to lead the procession of bullion-producing mines, which it is almost certain to do.

TIGER.—Deputy Sheriff Rybon returned from the Bradshaw country on Saturday last bringing with him \$6000 in bullion from the Tiger mine. He states that a very rich strike is reported in the Swallow mine, about seven miles below the Castle Creek smelter; that all the snow has melted in the vicinity of the Tiger mine.

IDAHO.

NEW REDUCTION CO.—*Boise City Statesman*, Jan. 14: The machinery for the foundry, pattern shop and machine shop of the Boise Iron & Reduction Works has arrived in the city, and as soon as the frost leaves the ground the work of constructing the buildings of the establishment will be commenced and pushed to completion. The machinery seems to be of the first grade, and will no doubt give perfect satisfaction. The directors of the company have decided to raise an additional \$7000, the money to be devoted to the erection of a stamp mill and a smelter in Boise. The city is now being canvassed by a committee, and as soon as the money shall have been raised or guaranteed the plant will be put in place.

DE LAMAR.—*Nugget*, Jan. 14: The De Lamar Company shipped out eight bars of bullion this morning, the result of the partial clean-up for the first nine days run in January. These bars will average close to \$2000 each. The mill is now running smoothly and crushing between 70 and 80 tons of ore per day. The amount of ore sacked and sent to be sold to smelters has been considerably increased. The De Lamar Company has had plans made and in a few days will begin the construction of a furnace for roasting a portion of their ore.

FLINT.—Several parties were over from the Flint district last week who say that the Flint mill is now running steadily night and day and turning out high grade concentrates, and that the company is continuing to ship rich rock. The big Corliss engine will be running in a day or two more. The dynamo to drive the electric drills has been set up and will be started with the new engine. These drills will be employed in diving the tunnel from the mill to the mines, and when completed electric cars will be used to deliver ore.

MONTANA.

ANACONDA.—*Butte Bystander*, Jan. 13: Notwithstanding the long shut-down of the Anaconda, the past year has been a prosperous one, and the properties opened up and worked will add greatly to the output of Butte in the future. Nearly 5,000,000 ounces of silver has been sent East from the mines of Butte this year, not including the amount shipped by the Anaconda or Boston and Montana. We have no means of knowing how much the Anaconda has shipped East, but that shipped by the Boston and Montana must have reached over 200,000 ounces. It is improbable that the silver produced in the mines of Butte will amount to 7,000,000 ounces. The Anaconda mines, including the syndicate properties, are not being operated to their full extent, only sufficient ore being taken out to supply the lower works at Anaconda.

THE BOSTON AND MONTANA CO. are taking out all the ore the smelter in Meadville can handle. The output will be greatly increased when the smelter at Great Falls is ready to begin

operations. Both the company and the Montana Central Railway are making preparations to handle the immense output of ore the great smelter will require when it once begins operations. The company have mortgaged their smelter at Great Falls, to secure the bonds issued, in the sum of \$600,000 to put in an electrolytic plant at Great Falls for refining their matter. The deed transferring the Valley claim to the Bannister mining company shows that the price paid was \$110,000. This claim adjoins the Vulcan on the south, and recent explorations have uncovered some very rich ore that will run up into the hundreds. This purchase will double the value of the property belonging to the Bannister mining company, and may lead to the sinking of a three-compartment shaft at a place from which both the claims may be worked economically.

MERRIMAC.—John Hegg, the owner, has sold to a syndicate, through Dan Simpson, a one-half interest in the Merrimac lead, the western extension of the Upper Big Ox at the head of Deer Creek, east of Marysville. The property is developed by a shaft sunk on the lead to the depth of 105 feet, which disclosed a good pay streak of milling silver ore which assays above \$90 a ton, 50 tons of which have been extracted in sinking the shaft.

NEW PROCESS.—Bntte *Inter-Mountain*, Jan. 13: It is understood that a new process of smelting is to be inaugurated at the Boston & Montana Works at Great Falls when they are started. Work is being vigorously pushed now. The new process is to use gas for smelting. For this purpose, a gas house is now being constructed and Sand Coulee coal is to be used to make the gas. It is said that a very strong and steady heat can be obtained from gas, which will be introduced into the furnaces through pipes. Drs. Mitchell and Mussigbrod have bought the claim adjoining the Royal on Flint creek and paid the owners, Willard Bennett and Mr. Turney, \$25,000 for it. H. L. Frank to-day sold 465 feet on the west end of the Philadelphia claim to the Colorado Co. for \$15,000. By a break in the main shaft of the engine at the Bi-Metallic mine yesterday evening, all work has been suspended. Three hundred miners are laid off until a new shaft can reach the mine. The crack is said to be due to crystallization.

NEW MEXICO.

BREMEN MILL.—*Southwest Sentinel*, Jan. 13: At the Bremen mill of the Grant County Mining and Milling Co., in this city, the bins are full of ore and the mill running to its full capacity, 15 stamps, night and day. A cleanup was made yesterday of a run of one hundred tons for John Brockman, from his mines at Lone Mountain. One hundred tons of ore from the Uncle Sam mine, at Cow Springs, which the company is working on a lease, are now at the mill and four teams are hauling steadily from the mine. A large lot of ore from Manuel Taylor's lease on the Providence mine, in Chloride Flat, is now being run through one battery. The company also has a contract to work several hundred tons of ore from the Sherman mine for W. H. Newcomb.

A MILL AT LONE MOUNTAIN.—At last, after all these years of solicitation and after numerous disappointments, Lone Mountain is to have a mill for the reduction of its ores. John Brockman has bought the Telegraph mill, on the Gila, and will remove it to Lone Mountain at an early date. Mr. Brockman has had hundreds of tons worked from his mines at Lone Mountain, and the placing of a mill at that point will not be an experiment, but an assured success from the start.

ST. HELENA.—*Silver City Enterprise*, Jan. 14: Operations on an extensive plan have been commenced on the St. Helena claim at Central. Fifteen men have been put to work by Judge Woods, the superintendent of the property. The development work is being carried on by a crosscut from the south shaft at a depth of 100 feet, which will intersect nine veins within 60 feet. These veins range in size from one foot to five feet in width on the surface, and as several of them converge in their downward course, the junctions of some of them may be found at this depth, and will possibly disclose ore bodies of great extent. The average value in gold on the surface is said to be above \$20 per ton. The upper shaft will be sunk to a depth 110 feet, when drifting will be prosecuted on the 100 foot level. When the development work shall have shown sufficient ore in sight to warrant it, a mill will be erected near the mine. The St. Helena is principally held by Judge Woods, John M. Wright, H. H. Whitehill, Gustav Wormser, Eugene McComas, W. H. Lyford. The present work is being prosecuted at the expense of L. T. Dickason.

OREGON.

A PROSPEROUS DAWN.—*Bedrock Democrat*, Jan. 11: The placer miner will have plenty of water next spring, and will make the most of it. Already we hear of placer owners making preparations for the coming season, which give promise of proving the best we have had for many years. From every district, most promising reports are received. Owners of quartz claims are putting in the winter developing their properties, and with the opening of spring, many new mines will be added to our fast increasing lullion producers. The mills on the various mining properties in this vicinity are pushed to their fullest capacity, and the outputs are very satisfactory to all concerned.

MINE SOLD.—The necessary papers have been made and executed transferring the ownership in the McGinty mine, situated in the Elkhorn mining district. The ledge was discovered by Mr. Daniel Robbins, who did very little development work; but enough was done to disclose a fine vein of ore, and the property has a promising future.

WASHINGTON.

WATER SUPPLY.—*Ellensburg Capital*, Jan. 14: Almost every day now more snow is being added to the already deep fall in the mountains, from whence the water supply for our valley comes. According to some reports, there is already more snow there than has fallen in several years, and all agree that it is unprecedented for this stage of the season. It is already from 12 to 15 feet deep on the summits to the north, and the usual weather for snow is only beginning. There consequently need be no hesitation in predicting plenty of it in the mountains this winter. It means a great year in the mines, for water is one of the greatest necessities in a mining region, and this year it will be abundant. It means that work can and will be prosecuted on a larger scale than ever before, and of course the output should be correspondingly increased.

Delegates to the State Miners' Convention.

The following list comprises the names of delegates from the various counties of the State, as reported to the Secretary of the Executive Committee of the Placer County Miners' Association. Some of the delegations were appointed by the miners at their meetings, and others by the Boards of Supervisors of the respective counties. It is proper to note that the list is printed as prepared before being submitted to the Committee on Credentials of the convention.

MECHANICAL PROGRESS.

Labor-Saving Inventions in England and in the United States.

The following remarks from an English correspondent of the *American Manufacturer* will be read with much interest in connection with three of the articles which follow under our standing head of "Mechanical Progress" for the present week. These three American inventions, which have only quite recently been placed before the world, may be considered as nearly, if not quite, equal in importance to the other great inventions referred to by the English writer and addressed to our cotemporary already named. Americans may well feel proud of the record. Under date of Dec. 9, 1891, the English writer proceeds as follows:

"In the employment of machinery, America leads the van. This statement has been made over and over again, and as the years go by, events but confirm its correctness. America seems to be more alive than any modern nation to the fact that manual labor is about the most expensive method of production that can be adopted, and consequently the tendency in your country is to the use of automata to as great an extent as possible.

"In labor-saving appliances, you are distinctly ahead of us. There is much truth in the statements of those who allege that in the application of science to social and industrial uses, America is far in advance of other nations. Undoubtedly, many of the most important practical inventions which have contributed to the progress of the world during the past century originated with Americans. There are those who hold that no other people have devised so many labor-saving machines and appliances, and who point out that the first commercially successful steamboat navigated the Hudson, and the first steamship to cross the Atlantic sailed under an American flag from an American port, while to American ingenuity is attributed the cotton gin and the first practical mowing, reaping and sewing machines.

"The wisdom of your labor-saving policy becomes increasingly evident with the lapse of time, for everything points in the direction of increasing international competition, with the result that the nations must cut down those costs of production in which labor is so heavy an item. Incessant improvements in the application of machinery, and of various forms of motive power, show that many processes for which the human hand is now indispensable, will soon have machines adapted to them, and these, if not altogether displacing human labor, will render one man capable of producing or rather of superintending the production of a quantity of manufactured articles now requiring 10 or 20 or more workmen, whose energies will, however, be thus set free for service of perhaps a more useful character, both for themselves and for the nation, than those duties of a mechanical order which can be performed by machinery."

A Great Improvement in Cutting Lumber.

A new and valuable lumber-cutting machine was recently subjected to a most successful trial at Greenport, Long Island, in the presence of several of the most prominent lumbermen of New York. The experiment was highly successful, both in the superior character of the work turned out and in the speed and economy with which it was done. It was pronounced far ahead of any sawing device ever employed for such purpose. It will cut lumber of any thickness, from one-thirty-second of an inch to two inches in thickness. It will take a log eight feet long and cut boards at the rate of 40 a minute of any given thickness. There is not the slightest waste of material in the cutting. It is calculated that when *saws* are used, one-fourth of the wood is wasted in sawdust and planing if inch boards are being cut. In sawing boards one-sixteenth of an inch in thickness, the loss is 215 per cent of the material.

The machine is 42 feet long, 15 feet wide and 8 feet high. The object of the machine is to economize time, cost and raw material. The output of a single machine, when in good running order, is set down at from 80 to 100,000 superficial feet per day.

It is claimed that this new invention will revolutionize the making of boards for cigar boxes, backs of pictures, butter boxes and the like. At the time of the test, ash, cherry, birch and basswood logs were cut.

The boards dropped from the blade as smooth as if rubbed with sandpaper. One of the witnesses of the trial, Mr. Albert Lewis of the Wilksbarre Lumber Co., one of the largest lumber concerns in Pennsylvania, said it was the most perfect thing he ever saw. With our saws, he continued, we cannot cut dry lumber at all, while this machine cuts anything. Neither could our saws cut a board one-thirty-second of an inch in thickness, as this will. But the best thing it will accomplish will be the tremendous saving in the wood itself.

The Bevington Welding Process.

This new mode of welding, without the use of fluxes of any kind, and in which no heat from fire is used, is entirely novel in character, and is attracting much attention from iron workers from its simplicity, its effectiveness and the speedy manner in which the work is done. The heat employed is simply frictional heat, and is produced by pressure and friction between the surfaces to be joined, as they pass through the machinery employed in doing the work.

As an evidence of its novelty and great value, we need only refer to the fact that the Committee on Science and Arts of the Philadelphia Franklin Institute has recently recommended that the Elliot Cresson medal be awarded to the inventor of the process.

This invention is described by that Committee as follows: "The invention consists in forcing strips, rods or tubes of ductile metal into converging revolving dies of harder metal, in which it becomes heated and compacted and acquires the shape of the interior of the die. The machine adapted to carry out this process is substantially a lathe, with hollow arbors in both headstock and tailstock. The hollow spindle of the tailstock is screw-threaded, and is mounted in a threaded-bearing, so that it can be set in and out, for which purpose it is provided with a hand wheel. A contractile clamp is set in the inner end of this arbor, which is adapted to hold the rod or wire from turning as well as moving lengthwise. Two wires to be welded are preferably prepared by scaring or by cutting the ends upon an incline, so as to give each a corresponding bevel. One of the wires is thrust through the hollow shaft, and part way through the die, and the wire is fastened in this position by means of the clamp at the rear of the headstock. The other wire is inserted in the tubular spindle of the tailstock and passed out through the clamp a little way, and is then firmly secured in place by means of this clamp. The arbor of the tailstock is then fed inward until the beveled end of the wire is forced into the die and brought firmly against the bevel of the other wire. The die is then very rapidly revolved, while of course the two wires are held in a fixed position and forced together. During this rapid movement of the die, a very high degree of heat is developed by frictional contact, which is of sufficient intensity to heat the two ends of the wire to a welding heat and perfectly weld them together along their contact faces."

It will be somewhat difficult for any person, even a well versed mechanic, to form a very adequate idea of the machinery employed in the process by any description that can be made of it without a full illustration of the same, which we hope to be able to give at an early day in the future.

Until we are able to present such an illustration, we will only say that it may be applied to the welding of wires or round iron rods, after the ends to be welded have been properly scarfed so as to be brought together, without materially increasing the diameter of the rods at the point of junction.

Hollow tubes or piping, either iron or copper, for gas or water use may be formed and perfectly welded from flat strips of iron. The iron strips are simply wound upon a reel, the laps overlying each other, the free end of the strip brought in contact with the machine, which, when in motion, draws the strip from the reel, and by automatic movements gradually shapes the iron into proper form and delivers it at the opposite extremity a firmly welded tube, so neatly and perfectly done that the place of the weld is scarcely perceptible. The welding seam may be made either straight from end to end or it may be made to pass around the tube in spiral form, which latter, of course, greatly adds to the strength of the weld. Of course, the tubes or pipes can be made of any desirable lengths.

The capacity and utility of this invention is pronounced by the Committee of the Franklin Institute, above referred to, as almost unlimited when circular forms of ductile metal are required. It has already been applied, commercially, with most satisfactory results, to cartridge cans for dynamite projectiles and seems to develop the fullest

strength of the material employed. The committee concludes its report with the statement that the invention is entirely novel, is simple and easily managed and economical in use, and does not require a very costly plant. It is undoubtedly one of the most novel and useful inventions of the day.

A Successful Cotton Picker.

Several machines have been devised and put into more or less extensive practice to supplant the slow process of picking cotton by hand, but until in the one below described we have never met with one which seems to have received the full confidence of any extensive cotton grower. We infer however from what appears below, that success has now been reached in a recent invention by Mr. Angus Campbell, a native of Ontario county, Canada, but for the last 12 years a resident of Chicago, which is pronounced nearly, if not quite fully equal in value and importance for picking cotton to the invention of Whitney's cotton gin for clearing that product of its seeds. It is described as a marvelous triumph of mechanical skill in accomplishing, by rapid machine work, the slow and expensive handwork now employed in picking cotton. Several inventions for accomplishing that work have heretofore been made, some of which have met with encouraging success, but Campbell's machine is said to be a complete triumph. Picking cotton is a very complicated work for a machine, from the fact that choice and judgment must necessarily enter largely into the work.

The cotton plant is loaded at the same time with ripe cotton, unripened bolls and blossoms. No machine can be a success unless it will pick what is ripe and *all* that is ripe, and leave uninjured the unripened bolls and blossoms to develop for a later picking. This Mr. Campbell's invention will do, and a hundred Southern newspapers have proclaimed the fact that their representatives have witnessed its successful performances in the cotton fields near Waco, Texas. The Southern planters were at first too incredulous to give it serious consideration, but after they have witnessed its operations they have become very enthusiastic, as they know that it costs more than \$100,000,000 to pick the cotton of this country. By the use of this machine, it is confidently predicted the same work can be done at a cost of not more than \$25,000,000. A saving of \$75,000,000 annually in this country alone in putting on the market one of our most needed products, and one which does or should enter largely into the daily wear of every human being on earth, is a matter of inestimable importance, and it will add still another bright laurel to the genius of American invention. Mr. Campbell may now take rank with the great inventors of the world, and it goes without saying that both himself and his associates, who are engaged with him in putting this invention before the world, will reap enormous profits. A company, with a capital of \$5,000,000, has been organized to build factories and enter upon the manufacture of the machines, for which there must soon be an enormous demand.

SCIENTIFIC PROGRESS.

Superior Coal from Common Lignite

Mr. Albert Edelmann, a native of Poland, a graduate of the University of Dorpat, and a civil engineer who has exercised his profession for many years in Europe and Australia, and who subsequently found his way to Washington, D. C., claims to have discovered a cheap method of converting our cheap lignites into a coal as valuable as our best bituminous or anthracite coals. It is generally admitted that our bituminous and anthracite coals have been changed from their original character, as lignites, by the slow processes of nature, which have occupied many thousands of years, into the improved conditions in which we now find them. Mr. Edelmann claims to have discovered a rapid and cheap process by which these lignites may be thus artificially changed by a rapid chemical process, which will add but very little to the original cost of the lignites.

Mr. Edelmann claims to have devoted some twenty years of study in perfecting his invention, and now feels satisfied that he can cheaply and rapidly convert the almost worthless lignites into the most valuable of mineral coals. This process, he claims, is simply a chemical one, fully as effective in the changes produced as are the slow processes of nature. In describing his process the inventor says: "To accomplish this result the lignite and certain chemical bodies (which have first been reduced to a powdered condition in order to permit of their perfect commingling) are

placed in molds and subjected to great pressure by machinery, and from which the mass comes in the shape of what are termed, for want of a better name, 'briquets.' These briquets can be made of any size or shape, in order that they may suit different conditions, as, for instance, if the material is to be used for furnaces they would be in the neighborhood of eight inches in size (either square or oblong) whereas for stoves they would be made correspondingly smaller. A great advantage about having them made into this shape, square or oblong, is that they will not chip off or become broken in any manner like ordinary coal; in fact, the immense pressure exerted in forming them tends to make them even harder than ordinary lump coal.

"A desideratum about lignite is that it is found near the surface of the earth, and consequently the cost of mining it is reduced, and at the same time the supply is practically inexhaustible. The chemical bodies used are also comparatively inexpensive, so that this coal (for this composition is coal in every sense of the word) can be manufactured more cheaply than either bituminous or anthracite coal can be produced.

This new aspirant for fame and fortune seems to at least have the courage of his convictions, for he is freely spending his own money to prove the results of his discovery. The *New York Herald*, from which we gather these particulars, says his claims are entitled to respect and confidence, from the fact that the Patent Department at Washington stands ready to issue to him his patent papers as soon as he has made the necessary arrangements for foreign patents, for which purpose he has just left for Europe.

Lignite which comprises the chief portion of his artificial coal is abundant in almost all parts of the world, is generally near the surface, is cheaply mined, and is of but little value. The inventor claims to have already purchased a large tract of lignite land in Texas, which abounds in this cheap and almost worthless coal. According to the *Herald*, Mr. Edelmann has received a large offer for his invention or an interest therein, from a corporation which agrees to take 300,000 tons of coal a year, as soon as it can be delivered. Improbable as the discovery appears to be, it seems to be vouched for by the Patent Department at Washington, which never lends itself to any mere chimerical scheme which partakes in any way of the nature of a fake or swindle.

TO PREVENT ACCIDENTS FROM EXPLOSIVE GASES IN COAL MINES.—A recent English invention is a water cartridge, some very interesting experiments with which were recently tried in an English mine. An explosive charge of tonite is placed in a tin tube of a size suitable for a shot-hole. The tube is filled with water, and the cartridge is suspended in it by means of a wire connection with the detonator. The tube is securely plugged, the cartridge placed in the shot hole and rammed in the usual way. The advantage claimed is that when the charge is exploded there is no flame, and consequently no danger of igniting gas, while at the same time the coal is not shattered as in ordinary blasting. At tests made with the cartridge, four ordinary shots were fired in the coal with four-ounce charges of tonite without any flame being observed. In a severe test, two blow-out shots were tried in hard metal, with no indication of flame, while as a final test a loaded cartridge was fired on the mine floor, and again there was no indication of flame. These tests were regarded by the mining experts present as conclusive as to the absolutely flameless properties of the cartridge.

NEW FORM OF LIGHT.—An improved industrial light, it is said, has been devised for burning any of the common heavy oils. A tank containing the oil has been constructed, inside of it, a small steam boiler with steam gauge and safety valve, and giving a steam pressure of from 25 to 50 pounds per square inch. By a suitable arrangement of taps the steam is made to convert the oil into a spray, in which form it is burned, giving a brilliant light. By this means there is no spluttering or unconsumed oil, and the burner requires no cleaning. The use of steam obviates the necessity of the periodical pumping of air that is necessary in many forms of these lights to give the required pressure to consume the oil.

THE LIGHT FROM AN ARC LAMP.—It is said that the great light from an arc lamp comes from the crater in one of the carbons. Hence recent search lights are arranged so that the light of the crater is thrown on the reflectors, and not the flame light, as that is purple and of feeble quality.

ENGINEERING NOTES.

The North River Bridges.

The formal breaking of ground for the great North River bridge has just taken place and is regarded by those directly concerned as an event of importance comparing well with the laying of the Atlantic cable or the building of the Canadian Pacific railroad.

About the same time as above, on Dec. 24th, the New York and New Jersey Bridge Company also went through the ceremony of turning the first sod for its proposed structure.

Although Congress has not as yet granted authority for either of the above named companies to span the North river at the points indicated, both connecting New York City with the New Jersey shore, still both companies appear to be taking active steps to commence the real work of bridging that river.

Chief Engineer Clarke, of the last mentioned Co., in answer to the question whether he thought the bridge would pay if built, said: "If every passenger over the Pennsylvania road had a trunk and would pay 40 cents for its transportation over the bridge, that alone would give the bridge a fair profit on the investment."

There is but little doubt but that a concession will be granted by Congress for both of these bridges, and that both will be built and prove profitable speculations; and, in addition, the tunnel will also pay if it should ever be completed, which it probably will be even before a passenger is able to cross either of the bridges.

Strange to say, and true it is, that the chief opposition to the building of these bridges comes from the New York and New Haven Railway and the Union Ferry Company. Of course, such a fractious and unpatriotic opposition will go for naught when the real struggle comes on in Congress.

THE IMPORTANCE OF THESE GREAT WORKS.

Andrew H. Green, in his address delivered on the occasion of breaking ground for the North River bridge, said: "The illusion that the prosperity of New York depends principally upon her foreign trade is being dissipated, and while we would, by all proper means, augment our commerce with other countries, we must no longer delay facilities demanded for our own. The greatness and prosperity of cities are not dependent upon foreign commerce. The historic cities of Asia and Egypt were interior cities. Paris, Berlin, Moscow, Vienna, Madrid and Cairo are interior cities, and there are, as well, many of our own thriving Western cities that live chiefly upon the traffic that comes from their own vicinage. A view of the commercial development along our Atlantic Coast shows that cities that have the best approaches by land routes are necessarily the ones that have greatest growth and prosperity, and not those primarily provided with the best sea approaches and harbors. It is evident that bridge communications between New York and New Jersey, and her neighboring territory, have been too long delayed. The disadvantages heretofore attending this condition can now be obviated by the marvelous triumphs of modern engineering. From her position, New York is the *entrepot* and thoroughfare of the great regions to the north, east and west, and all that is needed to perfect the bounty of her opportunities is the consummation of the work now inaugurated."

The Nicaragua Canal.

The completion of the Nicaragua canal, says the *Chicago Tribune*, is one of the most important questions which will occupy the attention of the fifty-second Congress. Its necessity as an auxiliary to our naval power and the defenses of our coasts has been fully recognized by the Secretary of the Navy in his report.

The President in his annual message recognizes the canal as "the most important subject now connected with the commercial growth and progress of the United States," and makes the following direct and practicable appeal to Congress:

If this work is to be promoted by the usual financial methods, without the aid of this Government, the expenditures, in its interest-bearing securities and stock, will probably be twice the actual cost. This will necessitate higher tolls and constitute a heavy and altogether needless burden upon our commerce and that of the world. Every dollar of the bonds and stock of the company should represent a dollar expended in the legitimate and economical prosecution of the work. This is only possible by giving to the bonds the guarantee of the

United States Government. Such a guarantee would secure the ready sale at par of a three per cent bond from time to time, as the money was needed.

It is to be hoped Congress will take some definite action at this session toward the construction of the canal. The strategic value alone of the canal in the event of war is sufficient to warrant the Government in endorsing the work and giving it financial backing.

SOME MONSTER DAMS.—It is to be hoped that the gigantic dams which are being erected in the West for irrigating purposes are being constructed solidly enough to insure the safety of the people living in the valleys below them. Persons who have never seen an irrigating dam have but a slight conception of their immensity. The following are the dimensions of four of the largest that have been completed within the last year: First—The Walnut Grove dam, near Prescott, A. T., 110 feet high, inclosing 750 acres, with a capacity of 4,000,000,000 gallons. Second—The Merced dam, Central California, one mile long, 60 feet high, 650 acres, capacity 5,500,000,000 gallons. Third—Sweetwater river dam, near San Diego, California, 90 feet high, 725 acres, capacity, 6,000,000,000 gallons. Fourth—The Bear Valley dam, in San Bernardino county, California, is 60 feet high, inclosing 2,250 acres, and will hold 10,000,000,000 gallons of water.—St. Louis Republic.

The last mentioned dam impounds the largest artificial body of water in this country, and perhaps in the world, and is soon to be enlarged to more than double its present amount, by a new and higher dam just below the present one.—Ed.]

ELECTRICITY.

Electrical Railroads.

The electric road is still in its infancy, but it is being rapidly adapted for both transportation and freight. As yet it is confined exclusively to short distances; but the success attending these experimental roads is most encouraging for an enlarged and vigorous future. Here in California we already have a number of electric roads of considerable length either in actual progress of construction or in an advanced state of preparation therefor. The Oakland and San Jose road which will convey both passengers and freight, is making good headway in construction. The road upon the west side of the bay, from this city to Half Moon Bay, will be the pioneer in this class of construction and will prove a great boon to farmers and others who live along the lines of travel. The time is not far distant when the people of this city will be able to make the entire trip from San Francisco to San Jose on one side of the bay and return by the other, a distance of about 100 miles through one of the finest agricultural sections of the State.

Soon after, and perhaps before these roads are completed, we shall have another reaching from tide water at or near Vallejo far up into Napa and other minor valleys tributary to the point mentioned. Producers along all these lines of travel will then be able to ship their products to this city at a much less cost than now.

The time will also soon come when similar facilities will be within the reach of the farmers in all our great valleys from the northern Sacramento to the extreme of the southern San Joaquin, with branches at short intervals and in every direction into the foothills. When this is reached, both passengers and traffic will be relieved from the short-haul exactions of our existing continental roads.

Electric roads can be built and operated for much less money than is required for steam motor roads, and when they are confined to the valley lands alone, the people who support them will be relieved of the extra tax now levied upon them to support the more expensive portions of the longer roads which extend far into and over the mountains. The electric road will, in the near future, become eventually the farmers' and the people's roads. They will be owned and operated by the people and for the people.

California can make no mistake in building electric roads. The time is fully ripe for energetic movements in this direction. The future of the commercial and farming interests of California lies in electric roads for local traffic and the ocean route via the Straits of Magellan or Nicaragua canal for the greater part of our bulky products. Our overland roads will be supported mainly by

passenger traffic and fast freight trains for the transportation of costly goods and perishable fruits. By the time the new means of traffic and transportation are completed our rapidly multiplying products and travel will give full employment to both our existing and future means of transit.

Steam and Electricity on the Farm.

It goes without saying that great improvements have been made, during the last few years, in agricultural work, not only in the introduction of machinery for doing the work heretofore accomplished by hand, but also in many cases by the substitution of steam for horse power. The introduction of machinery made it possible to transfer a large portion of the hand work on the farm to animal power. When the reaper took the place of the old time cradle, and the flail gave way to the thrasher, it became possible to introduce the horse more generally into farm work. The substitution of the steel plow for the rude wooden and wrought iron implements that had been used from the dawn of civilization, was another step in advance; but all this soon became crude and unsatisfactory—a mere "cruelty to animals" compared with the later introduction of steam upon the farm.

On the great plains of our Western States and throughout the vast level valleys of California, it was soon found practical to substitute steam for the horse in reaping, mowing, thrashing and plowing. Our inventors and engineers found a way to disconnect the horse and substitute tireless steam motors for weak and costly animal power. The application of steam to the reaper, the thrasher and the plow was a wonderful advance in agriculture, and placed that industry in the same line with manufactures and commerce. As a result of these improvements, the great Western States and California have developed agricultural productions to an extent which many centuries could not have reached by the old methods, and have moreover vastly reduced the cost of the most important necessities of life.

In addition to what steam has done on the farm, it has also done away with the slow-moving caravans, by which animal power was compelled to distribute the products of the farm to the various classes of consumers whose occupations made it necessary that they should be domiciled at distances of greater or less extent from the sources of their food and other supplies. The application of steam to the locomotive, hauling carriages on iron rails, has in these latter days made transportation so cheap that we can now transport our farm products across continents and over oceans as cheap as the old time ox and horse team could haul them to a near-by town for consumption.

BUT WE HAVE NOT YET REACHED THE END.

Inventors have sought through earth and air, and are constantly seeking for still further means to simplify and cheapen productions—on the farm, in the manufactory, and transportation by land and water. The steam engine has been improved and pushed about to its limit. It has proven itself a most obedient giant in doing the will of man. It has revolutionized every industry and every pathway, but with the irrepressible genius and forward thought of man, he must still progress—he must find other worlds to conquer. In this work of progress he has risen above both earth and water and is seeking to wrest further secrets from nature. He has grasped and is seeking to harness for his use the most subtle, the most energetic and the most obscure power which it has thus far been possible for him to reach—electricity. His success thus far in this new enterprise has been wonderful, indeed far beyond, considering the time which has elapsed, any undertaking which he has hitherto attempted. As yet he has not discovered its source, or rather the way to develop its power direct from its source. He can only use stratagem, or another power, to develop the new power he seeks. He impounds water and develops power which is useless where developed, but he calls to his aid electricity as a most convenient and economical means to convey it where it is wanted. He sometimes uses steam for the same purpose—both are costly and a roundabout way is the only method he yet has for reaching the ultimate.

He knows that heat, light and electricity are one and the same and interconvertible, the one into the other. They are also as universal and as free for use as the air we breathe. He is now endeavoring to seek a cheap and ready method for converting cheap and powerless heat into the active en-

ergy of electricity. He has, in all probability, reached the very verge of the great secret. Seemingly, when that end is accomplished, he will have found the true philosopher's stone, and there will be no more world's to conquer.

No one will profit more than the farmer by such a discovery. The true electric motor, when attained, will be the most obedient, the most flexible, the simplest motor, imaginable. It will have few wearing parts, all of which can be protected from dust and dirt. It will have ample power, little weight, and will need but a mere modicum of the fuel required to feed an engine.

It will greatly lighten labor, both human and animal; it will increase production, decrease the cost thereof and cheapen food for both man and animals. The whip will be no longer needed; the use of coal will be reduced to a mere moiety, and agriculture will be still further raised in dignity and usefulness. Let us hopefully desire and earnestly work for such a grand and desirable result.

In the meantime we must depend upon water and steam for our present purpose, and use the coming power merely as a carrier. As such it will soon find its use upon the farm to drive the harvester, the thrasher and the plow, and transport our products from the farm to the consumer.

GOOD HEALTH.

Can Cancer Be Cured?

Let Sufferers See for Themselves and Act Accordingly.

Under the above head, the *Morning Call* of this city gives the following, which is a full endorsement of what has been repeatedly set forth in the columns of the PRESS:

"The medical profession the world over has always maintained that cancer was a malady which was absolutely incurable. Caustics, deadly drugs and the cauterizing iron have been administered to the tortured patient until he has succumbed, if not to the disease itself, to the excess of experimental practice, which has exhausted the vital forces; and now comes the startling announcement that not only is cancer eradicable "without the use of either plaster or knife, or any other treatment which entails pain or suffering," but that the discoverer of the remedy is a woman, Mrs. Dr. C. A. Cook, of 224 Post street, who, under the auspices of the 'King's Daughters,' an active and benevolent association which has a world-wide celebrity, has been placed in possession of the building owned by the city, and formerly occupied by 'The Old People's Home.' Five patients (since increased to eight and more coming) are now occupying separate, cosy rooms, and all are said to be doing well, with every prospect of an early and complete cure. Those afflicted will not have to go abroad to investigate methods, and ascertain from those under treatment the measure of success, for Dr. Cook's success or failure can be verified right here. Let such as are suffering see for themselves, draw their own conclusions and be governed accordingly."

Why will not our physicians, and suffering patients as well, heed the advice of the *Call* given in the concluding lines of the above paragraph? By so doing hundreds of lives might be saved in this city alone, to say nothing of other localities. Where are our city and State Boards of Health, who are paid for looking after the health of the citizens of this State and city, that they do not enquire into this matter and see whether it is true or not? If the claim set up that we have a painless specific for cancer in this city, and that the knife and caustics and cauterizing iron, in view of this fact, are simply useless and barbarous, is false, why do not our health officers look into the same and authoritatively pronounce the claim a swindle and the practitioner a humbug and a criminal for obtaining money under false pretenses? Is it not their duty to do it? If we have been so fortunate as to secure, in our present, as good a Grand Jury as the one just pronounced illegal, it is to be hoped a proper inquiry will be made into the matter by that body. Such an inquiry is more important than even that of the doings of "political boodlers"—as much more important as human life is worth more than dollars and cents.

HEALTHFUL AND PLEASANT.—If you want a lovely odor in your rooms, says the *Scientific American*, break off branches of the Norway spruce, and arrange them in a large jug well-filled with water. In a few days, tender, pale green branches feather out, soft and cool to the touch and giving a delightful and health-giving odor.

Passing Events.

The interest of the mining community of this State is this week centered in the Mining Convention in session in this city. A large and representative body of men has met to consider the questions relating to the business of mining with a view to its improvement in various ways. As far as the proceedings have gone to the present writing, everything has been harmonious. The representatives from the valley counties have been accorded a hearing and express themselves as generally satisfied that the miners desire to ask for nothing which will injure other interests. As long as that feeling prevails, the contending factions can be brought together in harmonious action, which should result in mutual benefit. The resolutions and memorial adopted by the Convention are conservative, and cover the ground very fully. The discussion on past troubles and effects has been avoided, and the attention turned almost entirely in the direction of remedial measures.

FALL OF A METEORITE.—A small meteoric fragment is said to have passed through the window of a house at Carson, Nevada, on the 4th instant. It fell from a cloudless sky about 4 o'clock P. M. It weighs less than an ounce and is pronounced a genuine meteorite. It will be sent to the Smithsonian Institute at Washington.

The State Mining Convention.

On Wednesday at 2 o'clock the State Mining Convention assembled in Pioneer Hall. J. H. Neff of Placer county, chairman of the Placer County Miners' Association which issued the call for the State Convention, was elected temporary chairman on nomination of Judge Walling of Sacramento, seconded by Mr. Johnson of Sacramento.

Mr. Neff was elected, and upon taking the chair addressed the Convention as follows:

Gentlemen, I thank you. I shall endeavor as a temporary officer to so conduct the affairs of the Convention as to be considered impartial and fair, and particularly so to our friends who come here from a distance, representing districts that are not strictly mining counties. I wish to admonish you, my friends, to be particular regarding the resolutions you shall formulate here. We cannot afford to antagonize the farming interests of this State. There are two great contending interests in California that we want to harmonize and to weld into the bond of a fraternal union.

This Convention was not called for the purpose of nullifying any law or overriding any decision of the courts, for we consider ourselves law-abiding citizens. To our neighbors in the valleys we will say that we don't propose to cover you up with slickens. I have never in all my experience of 40 years in California seen a better representative body of citizens than that which I now see before me, and I do not think that we will disagree.

D. T. Cole of Sierra proposed W. C. Ralston of San Francisco as temporary secretary. Mr. Ralston received the unanimous vote of the meeting. E. A. Wiltzell of Nevada and Thomas B. Everett of Placer were appointed assistant secretaries.

After some discussion as to the number to be appointed on the committees, Mr. V. S. McClatchy of the Sacramento Bee, and a member of the Sacramento delegation, came before the convention and made a short but effective speech, as follows:

Mr. President and Gentlemen of the Convention: This is an honor which I had hardly expected to be called to the platform. I desire to say to this convention simply this, and it is something which yesterday I had no idea of saying. It occurred to me this morning that it ought to be said, from hearing various comments that had been made upon the appearance of the Sacramento delegates. I believe that the motives of these gentlemen in coming here were misunderstood. I, as one of the publishers of the Sacramento Bee, regarded as the most rabid anti-hydraulic in the State of California, can say with good grace to you, gentlemen, what I am about to say.

They have fought a good fight—the farmers and miners—because it was fought earnestly on both sides, and there is no good reason why good fighters should not be good fellows. That war is over. He is not a good patriot who continues a war after peace has been proclaimed. Both sides fought for what they deemed to be their rights—the valley man for the protection of his orchards, his goods and his improvements. You gentlemen have a right to conduct the business upon which you depend for a livelihood and which you believe to be right and proper.

This question has been submitted to the courts, and the courts have decided on the particular principle that any man can use his own so long as he does not injure the property of others. Now, gentlemen, we find from the almost unanimous expression on the part of the gentlemen engaged in hydraulic mining—and I want to say here that the valley people never had any objection to any other kind of mining save hydraulic mining—that they will not oppose the laws of the State and nation, and that they will not oppose the decrees of the courts, and we came down to say to you that we want to bridge the chasm. [Applause.]

Now we of the valley oppose mining only so far as it threatens to destroy our homes. Now that has passed away and we believe you will not do anything to injure us, we will extend to you the right hand of fellowship.

The Sacramento delegation came down here to help you to solve this problem of how not to injure the rivers or our homes, and in any means that will accomplish that object we are with you. We know that the people of the State of California, ourselves included, are as much interested in the prosperity of a great industry like mining as we are in the numerous other industries which we now foster. We want to foster mining, and we came here to say that there is only one California, the greatest country on God's footstool, and we wish to foster every industry that will tend to develop its great resources. [Applause.]

Gentlemen, I thank you for your attention, and I want to assure you with all modesty that we people in the valley, the rabid anti-hydraulic, only ask for what is fair, and will support you in any proposition that will not endanger our homes.

Mr. McClatchy's speech was received with great applause and furnished the keynote to the harmonious proceedings subsequently carried on. Judge Bell, of Shasta, said:

I wish to say on the part of the mining men of the State that we, too, will extend the hand

of fellowship to Mr. McClatchy and to those who represent the same interest as he. The mining men have no fight against any interest that is for the peace and welfare of this State.

The Secretary read telegrams from Senator Felton and Governor Markham, the former expressing his sympathy with the convention and the latter his regrets at not being able to be present.

G. H. Wheaton, M. P. Jones and E. T. Allen, a committee from the San Francisco Board of Trade, and A. J. Ralston, Robert Watt and G. W. McNear, a committee from the Chamber of Commerce, were announced and admitted to the convention.

J. K. Luttrell of Sonoma made a short speech and was followed by J. T. Devlin of Sacramento as follows:

"There are no people who would more gladly see the hamlets and villages of the mining regions of California filled with a happy and prosperous population than the people of Sacramento. They would be pleased to do anything to secure that result if it could be accomplished without injury to them. If the gentleman means that Congress shall be asked to provide a way by which engineering skill may be brought to bear successfully upon this work, we of Sacramento will approve of it. As I understand the sentiment of the mining delegates here from conversations which I have had with some of them, they recognize the decisions of the courts and the law that has been declared and determined and as law-abiding citizens, they desire to act within that law, and ask Congress to make appropriations to carry on the surveys and reports of the engineers, the work to be done without injury to the lowlands or to the Sacramento and the other rivers.

"In order, then, that there may be no misunderstanding, in order that our delegation may act in unison with you, let it be understood that the report will not be to overrule the decision of the court, but to secure the necessary appropriations in order that mining may not be resumed to the injury of the agricultural interests of the State."

Mr. Luttrell replied that the object was not to interfere with the courts—it was simply to ask Congress to pass laws making such appropriations as will enable the resumption of hydraulic mining, provided that it does not destroy the interests of the farmer.

A recess of an hour was taken then, and on reassembling at 5 o'clock, Chairman Neff announced the following committees:

Resolutions—C. W. Cross, Chas. G. Yale, San Francisco; J. B. Hobson, Placer; G. J. Carpenter, El Dorado; J. M. Walling, Nevada; F. M. Swasey, Shasta; Grove L. Johnson, Sacramento.

Permanent Organization—T. L. Ford, Sierra; L. S. Barnes, Shasta; D. K. Perkins, Butte; Edward Coleman, Nevada; S. K. Thornton, San Francisco; H. K. McCusick, Alameda; E. C. Voorheis, Amador.

Credentials—J. S. McBride, Nevada; Robert Howe, Sonoma; F. R. Wehe, Sierra; Thomas Fraser, El Dorado; M. M. Drew, Sacramento; A. B. Paul, Shasta; James O'Brien, Yuba; T. J. Nichols, Placer; James Tunstead, Marin; A. Walrath, San Francisco; H. V. Reardon, Butte; H. G. Blaisdell, Alameda; C. McTarnahan, Tuolumne; E. W. Jones, Colusa; H. R. Givens, Trinity.

Memorial—Chas. G. Yale, San Francisco; J. K. Luttrell, Sonoma; R. C. Downs, Amador; H. A. McCraney, Lake; G. W. Cox, Sierra; Myron Angell, San Luis Obispo; Frank McLaughlin, Butte; Patrick Reddy, Inyo; J. P. Haynes, Humboldt; W. W. Kellogg, Plumas; J. S. Cone, Tehama; James Nelson, Yuba; W. D. English, Alameda; I. H. Reed, Calaveras; A. B. Dibble, Nevada; J. M. Fulweiler, Placer; John H. Shine, Tuolumne; John McMurray, Trinity; J. J. Crawford, El Dorado; J. H. Lawrence, Merced; N. Coombs, Napa; Aaron Bell, Shasta; F. H. Hall, Siskiyou; R. T. Devlin, Sacramento; R. M. Folger, Mono.

In the evening the committees held three sessions and prepared their reports for the Convention.

It was found that Pioneer Hall was too small to accommodate the delegates and public, and on Thursday the Convention assembled at Metropolitan Hall, the body of which was completely filled. The gallery also held a large audience.

Owing to the hour at which it is necessary for us to go to press it is impossible to give any detailed account of the proceedings on Thursday. The resolutions were adopted as presented. The report of the Committee on Memorial was amended in some particulars and finally adopted. The memorial is as follows:

To the Honorable the Senate and the House of Representatives, in Congress Assembled: Your memorialists, representing the people of the State of California, in convention assembled at San Francisco for the purpose of considering the question of hydraulic mining and the improvement of the waterways of the State, respectfully represent:

That for many years there has been a conflict between the farming and hydraulic mining interests of California by reason of the debris from said mines injuring the navigable rivers and lands bordering thereon. By decisions of the federal courts injunctions were

issued against these mines and they were closed down, throwing many persons out of employment and causing great loss of capital invested in mines, ditches, etc., and a great industry paralyzed. The legislature of the State of California, realizing that a rehabilitation of this mining industry would benefit the people of the whole State and nation if it could be accomplished by joint resolution, brought the matter to the attention of Congress.

In accordance with this resolution, Congress passed an Act appointing a commission of engineers for the purpose of ascertaining if some plan could be devised to adjust the conflict between the mining and farming sections and the mining industry rehabilitated, and for examining the navigable rivers and their tributaries with a view to improvement and rectification of the rivers.

That, whereas, this Board of Engineer Officers constituted, under the provisions of this Act of Congress entitled "An Act for the investigation of the mining debris question in the State of California," approved Oct. 1, 1883, have made an examination and investigation of the mining debris question in the State of California for the purpose of ascertaining whether some plan could be devised whereby the present conflict between the mining and farming sections might be adjusted and the mining industry rehabilitated, and have made an examination of the injured navigable river channels, and their tributaries and lands adjacent thereto, with a view to the improvement and rectification of said rivers;

That it appears from said report that there are many hundreds of millions of dollars of gold in the auriferous gravel deposits of California which can be extracted by the hydraulic process, filling the arteries of commerce and stimulating to increased energy all the industries of this State and of the nation, and that wise statesmanship demands that this vast amount of gold should be added to the wealth of the country, if it can be done without material injury to the navigable rivers of the State and the adjacent lands;

That it appears by said report that dams and other restraining works may be erected in many of the canyons, which will not only restrain the material producing the damage complained of in the past, but will also restrain the debris now dislodged, but still remaining in the canyons.

We respectfully ask that your honorable body accept and adopt the report of the commission appointed by you for the purpose stated, and that Congress at once take steps to put into practical and effective operation the means suggested by the engineers in order that mining may be again resumed in the manner indicated without the injury complained of in the past.

Your memorialists further suggest that Congress, having appointed this commission to determine the question, should accept and act upon its conclusions, which are of a nature to be acceptable to both parties to the controversy, in that they provide that mining can be again carried on under the conditions named, and also that the debris will be restrained from the rivers and farming lands.

It is proper to represent also, that at four different sessions of the legislature of the State of California resolutions have been adopted calling the attention of Congress to this hydraulic mining question in California. At the last session the Governor, in his inaugural address, brought the matter again to the attention of the representatives of the people, and the legislature on December 29, 1891, again passed resolutions which were forwarded to Congress, setting forth the facts and asking for relief.

We recognize the fact that until Congress takes proper action for the erection of suitable works for the restraining of mining debris, hydraulic mining is absolutely restrained by the courts, and as law-abiding citizens, we recognize that the laws must be obeyed and the decrees of the courts respected; and inasmuch as the complete cessation of hydraulic mining until congressional action is had will be a great hardship to the mining regions and may result in their depopulation, we earnestly request you to take immediate action, in order that there may be an end of conflict and that no complaint may exist of enjoined mines refusing to obey the orders of courts.

We earnestly request you to make sufficient appropriations for the erection of dams or other restraining works in accordance with the report of said commission under such restrictions as to locality, size and extent of dams as may by law be provided for that purpose, in order that the debris resulting from hydraulic mining may be restrained as contemplated in said reports; and that said restraining dams shall be built in such rivers and streams and at such places therein as the needs of the mining industries and for the protection and preservation of farming and other interests of the State may require, as may be recommended by the Government engineers, and that all such dams shall be built and maintained at Government appropriation and expense.

That we recommend the appropriations recommended by the Government engineers for the improvement of the Sacramento, Feather and San Joaquin rivers and Petaluma creek. The commercial interests of the State of California and of the whole nation imperatively demand that these appropriations should be made.

Your memorialists above respectfully represent that the miners of the United States are dissatisfied with many of the rulings of the departments, which put unnecessary burdens upon them and prevent them from readily obtaining lands to the detriment of the mining interest. We respectfully ask that prompt Congressional action be taken upon the resolutions on the subject of the mining laws and department rulings, which were adopted at the California State Mining Convention, held in San Francisco, January 20, 1892.

Timbering in Bad Ground.

In the MINING AND SCIENTIFIC PRESS of last week a description was given of the great tunnel for the Croton aqueduct for the water supply of New York. In running this tunnel many difficulties were encountered, and the way they were overcome is of interest to the mining community, so constantly engaged in similar work. We therefore continue the subject and present

FIG. 1.—FIRST STAGE OF WORKING IN BAD GROUND.

FIG. 2.—SECTION AND PLAN OF CAVE IN TUNNEL.

FIG. 3.—DRIFTS AND TIMBERING IN BAD GROUND. SHAFT NO. 13, SOUTH HEADING.

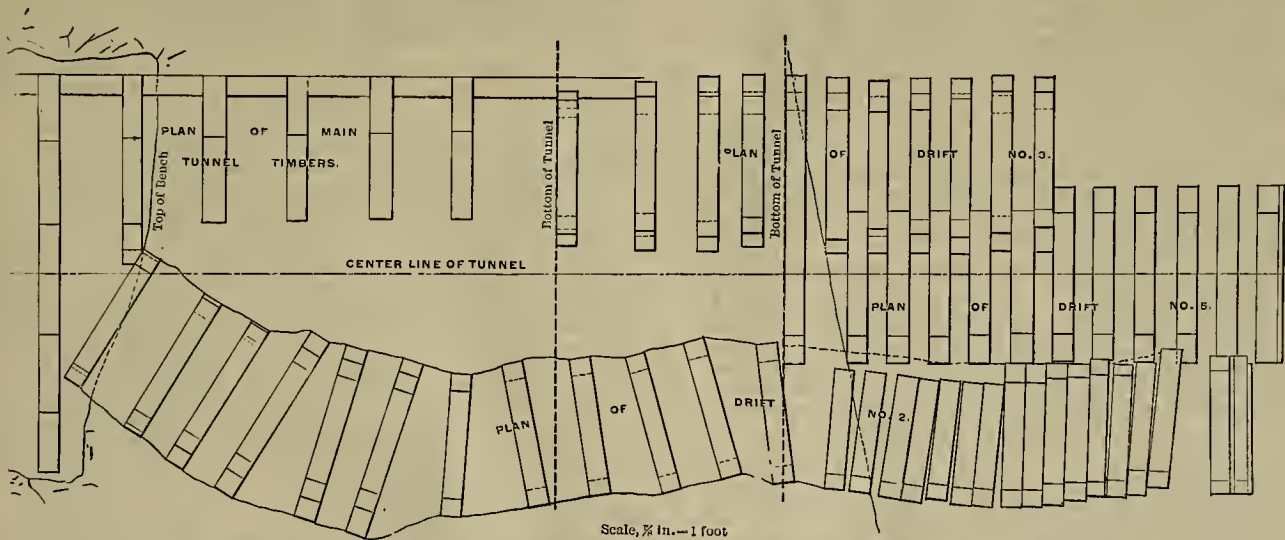

FIG. 4.—PLAN OF FIG. 3, SHOWING DRIFTS AND TIMBERING IN BAD GROUND.

first occurred. The men were driven out, and everything in the heading for 50 feet was covered out of sight.

Timbering of the form shown in Fig. 1, allowing for 20-inch brickwork, was then commenced at the soft rock. At the end of two months the heading had been cautiously advanced 34 feet and 17 sets of timber placed, the last two being reinforced with heavy hemlock spreaders. A bulkhead was then built at the ends of the timbers, this being the edge of the soft ground. The bench during this time had been brought up and was 32 feet behind.

For several days the clay and mud in the face of the heading were continually forced inward. Some idea of the pressure may be formed from the fact that the 24-inch oak logs used as rakers at the bulkhead became so crushed after 24 hours that they had to be continually renewed. A small cave on the surface then occurred. Finally, on February 20th, this was followed by a much larger one, about 25 feet east of the center line. It was directly in line of a small stream which partly filled it with water. The stream was immediately diverted, and a pump rigged to remove the water from the hole. This cave was supposed to be the mouth of the original fissure, and an abortive attempt was made to clog it up by throwing in bales of hay, cedar brush, logs and stumps. Either from the fact that the course of the brook had not been properly diverted, or by reason of a sudden thaw, or local conditions, this debris gently glided down into the tunnel, completely filling it for 70 feet, and gradually sloping down to a depth of 1.5 feet for 312 feet, or to within 75 feet of the foot of the shaft. It amounted to about 1189 cubic yards.

Faith in the theory of a fissure in the limestone led to the plan of a crib (Fig. 2). It was aimed to strike the fissure which was to be arched over or otherwise closed. The dimensions were 12x12 feet on the outside. It was built in the hole and consisted of wall plates of 12-inch timber, jointed at the ends and held apart by vertical posts 2 feet 10 inches long, placed at the corners, the whole system being held together by planks spiked on the outside. It was sunk to a depth of 50 feet, when hard pan occurring on the west side it began to sink irregularly. Sheet piling was then driven on the east side, and finally, to keep the crib from toppling over, ropes were attached to the top and bottom sets and secured to trees and posts on the surface.

After three week's work and the expenditure of about \$900, the contractors concluded that they had expended the "amount allowed for any work they should do on the surface, to be paid after the tunnel was through," and stopped.

several engravings showing the drifts and timbering in bad ground.

On June 1, 1885, the tunnel at the foot of shaft 13 was commenced and advanced 80 feet per month for 392 feet through

hard dolomitic limestone, which then became softer. Fifteen feet farther and the trouble began. There poured out a mixture of decomposed limestone, clay, sand and dirty water, which soon partially filled the

tunnel for 125 feet. After three days the water became clear, the fissure was plugged with straw, and the heading advanced 20 feet farther. Then, without warning, another outpour three times greater than the

At this time the Diamond drill was brought up and several holes sunk, from 100 to 200 feet, and the result of these borings was that work was stopped. Two years later the hole was filled up with 2533

cubic yards of earth. The contract price of \$5000 had to be paid, and to the relief of all concerned, the crib was buried out of sight.

At this time several plans were proposed. That of the division engineer in charge, Alfred Craven, was finally adopted in January, 1887. It was a timber platform of white oak pine, upon which the concrete should be laid. The horseshoe section was retained. For the next year work was carried on with a series of experimental drifts, conforming to no regular system of timbering.

The first drift started progressed 18 feet in two weeks. It was driven within the original heading on the west side. It advanced 20 feet when the sand rushed in through a 12-inch opening and filled it up for 12 feet. A bulkhead was then built across the entire heading, and the mud removed, which occupied three weeks longer (Figs. 1, 3, 4.)

The next experiment was to drive eight two-inch pipes, with perforated ends, 30 feet into the mud and sand, in order to drain it; this was not a success.

For the second drift, 40 feet with a sump was sunk 8 feet deep on the east side, and a ditch carried 4½ feet below invert-grade to the level. Here a bottom drift was started on the west side. It was five feet in the clear, and was timbered with square sets placed two to three feet apart; 19 regular sets and 10 intermediate sets were put in. It was 54 feet long, 35 feet through decomposed rock, the remaining 19 feet through heavy ground which caused the timbers to crack. Finally, mud ran in as fast as it could be excavated, so that the drift was abandoned after 11 week's work. Figs. 1, 3 and 4 show it in section elevation and plan.

The great trouble was to drain this ground. The water amounted to 160 gallons per minute. After ten months it had not sensibly diminished, and, in fact, never did diminish. There was some talk of diverting the line of the tunnel to the valley on the west, and making an open cut, but this was found, after survey, to be impracticable. The work was then abandoned for ten weeks, when the excavation was resumed and the masonry commenced. After seven weeks the tunnel was sufficiently widened, and on Dec. 4th the arch reached a point just 18 feet short of where the heading had been nearly a year before. How they proceeded after this will be told in the next number of the Press.

CONGRESSMAN CAMINETTI, of this State, referring to the debris in the rivers, says: "My idea is to build dams to prevent this damage, saying nothing about a future resumption of hydraulic mining. Then, if dams prove themselves capable of impounding all the debris that can possibly reach them, all parties will probably agree that mining may be resumed. I do not wish to set any one interest against another, but to promote measures in which all can unite." Mr. Caminetti proposes to introduce a bill for the improvement of every stream forming part of the Sacramento-San Joaquin system.

MINERAL CHARACTER OF LAND.—Where a preemption entry is attacked on the ground that it covers mineral land, it is not a sufficient defense to show that the mineral character of the land was not known to the entryman at the date of the entry, if it appears that it was thus known by others at such time, and that the ore was then exposed in such a manner and to such an extent that a person of ordinary intelligence who had been upon the tract could not be ignorant of the existence of the mineral deposit.—*Tinkham vs. McCaffrey*. [Asst. Secretary Chandler, Nov. 2, 1891.]

AMBITIOUS TERRITORIES.—Representative Washington of Tennessee, Chairman of the Committee on Territories, says that the Committee will undoubtedly prepare bills containing enabling acts by which Arizona and New Mexico can hold conventions to form constitutions that may be voted on by the people at the coming election in November. The bills, he says, will in all probability be so framed that the territories may, after the constitutions have been so adopted by the people be admitted by proclamation of the President, so no further action by Congress will be necessary.

Mining and Milling by Electric Power.

History of the First Mining Electric Power Transmission Plant in California.

To Mr. George Cullen-Pearson, manager of the American River Syndicate, an English corporation, belongs the credit of advancing to a practical, successful demonstration long distance power transmission for quartz mill running, and other mining purposes, in California, and perhaps in the world.

Certainly a plant, consisting of a Brush dynamo and motor, had been running a mill in New Zealand for a little time before Mr. Pearson put his in operation in El Dorado county, but it was only a small plant and the distance of transmission was only about one mile. Also, the Virginia City plant, with its dynamos 1600 feet beneath the surface, and its motors a short distance from the mouth of the shaft, down which the water to supply the Pelton wheels was piped, was at work before the completion of the El Dorado plant; but, though the amount of power transmitted aggregated several hundreds of horse power, the distance was comparatively trifling.

The attempt of the Sprague Electric Motor Company to transmit and distribute power by means of electricity at Big Bend, on the Feather river, in Butte Co., had signally failed. In this case there were 12 motors of five horse power each located at various places within eight miles distance from the water power.

At Aspen, in Colorado, the Sprague Co. had at work, with indifferent success, a plant consisting of a dynamo and an electric hoist of nominally 20-h. p., separated less than one mile. But in 1887, when Mr. Pearson conceived the idea of utilizing electric power for his mining purposes, these enumerated plants did not exist, with the possible exception of the New Zealand one.

In that year Mr. Pearson came to California to visit the Gopher Boulder and Dalmatia mines in El Dorado county, in which mines he had large financial interests. These mines were not yielding dividends, owing, as he rightly judged, to the low grade of the rock and large expenses incident to the methods pursued in mining and milling. Chief among the expenses was the one of fuel to generate the steam power used.

Having read in various technical journals of the day, of scientific prognostications, and of practical experiments, tending to demonstrate the application of electricity to the transmission and distribution of power from cheap sources, such as waterfalls, to places where power would otherwise be expensive, he determined to investigate the matter with a view to apply whatever might be good to these mines, in order to decrease operating expenses below the yield of bullion from the mines; in other words, to cease using the profits in buying wood to burn.

In pursuance of this object he came to San Francisco and visited Prof. N. S. Keith, who was then making electric motors, and had some in operation in San Francisco, furnishing power to several manufacturing establishments. These motors were run by electricity generated at the power station of the Pacific Power Co., No. 11 Stevenson St. This concern had then one 40-h. p. dynamo generating electricity to supply the Keith motors. This plant has since been increased to four of the 40-h. p. dynamos.

Prof. Keith assured Mr. Pearson that his scheme was surely practicable, and that he would undertake to construct the necessary dynamos and motors and insure their successful operation.

Being fully assured, Pearson purchased the Williams Ditch, used to convey water to the mines in Coloma, and acquired water rights on Rock Creek and on the American River at about its junction with Rock Creek.

In 1888 he returned to England, and proceeded to engage capital in his new, and then startling, enterprise. Messrs. John Taylor and Sons, the great mining capitalists of London, engaged him to still further investigate. He visited the Big Bend, Feather River plant and the one at Aspen, and the Sprague Electric Co., in New York. Lieut. Sprague thought he could transmit the desired power the required distance, but would not engage to do so under penalty. The experience at Big Bend had made him and his company cautious.

He then visited the Brush Electric Co., in Cleveland, Ohio, where Mr. Brush and the manager of the company assured him that they could, and would, fulfill his requirements. They cited the great plant which they had on the Comstock, and

what it was doing. These statements were, however, the roseate ones of expectation rather than the cold, dark, facts of realization. In truth many months expired before that plant came to work even tolerably. At the present time the speed regulation, and that of the electric current, are not automatic. The constant presence of a man at the nozzles of the wheels is necessary to regulate the apparatus whenever any change is made in the amount of power used in the mill; as in the starting or stopping of any of the plants, pans, crushers or concentrators.

Believing the assurances of the world-famous Brush Electric Co.; the American River Syndicate, which was organized in June, 1889, by Pearson, John Taylor & Sons, and Samuel Jennings, Chairman of the West Argentine Co., of the Argentine Republic, and of the Glen Rock mines, in India, ordered from the Brush Co., a 100 h. p. Brush Generator, and a 60 h. p. Brush Motor; both of the constant current type. These pieces of electrical apparatus were delivered in Placerville in the latter part of 1889, but owing to the bad roads and bad weather of that exceptional winter, they were not put in place, ready for operation, until May, 1890. "And then the trouble began."

Our illustration No. 5, on the first page of this issue, shows the power house, where the Brush dynamo is located, at the mouth of Rock Creek, where it empties into the south fork of the American river. The descent to this place is 1400 feet within about a mile. The dynamo weighing several thousand pounds, had to be lowered by rope tackle the last 800 feet of the descent.

The first start was made May 19th, 1890, but immediately it was found that there was no automatic regulation. The governor of the Pelton water wheel did not suitably govern the speed of the wheel, the automatic system of regulating the current from the dynamo did not operate, and the governor of the motor at the Dalmatia mill, over two miles away, did not govern the speed of the motor. The apparatus was nominally of 40 amperes capacity, with the volts variable to suit the amount of power used by the mill. Much time was consumed by the experts (?) sent by the Brush Co., to set up the plant, and instruct others to run it, in endeavoring to make these several ungoverned pieces of apparatus work in unison and give a constant rate of speed of the mill; but without success; and they finally left in defeat.

But Pearson and his superintendent, W. H. Husband, were not to be thus easily defeated. After the retirement of the experts they started to experiment for themselves, and soon found that by placing a man at the lever by which the nozzle directing the water on the Pelton wheel was deflected, and letting him know by telephone how many amperes of current were needed, he could cautiously set the speed of the wheel which drove the dynamo until it furnished the desired amount of current to actuate the motor so that it ran at the speed which was necessary.

They found by experiment the various numbers of amperes which would run any or all parts of the mill; so that, by telephone, when changes were to be made in the mill, the man at the station was notified to make the suitable changes at his end of the line. This was found out in July, 1890, and from that time until August, 1891, the plant was run continuously without any very serious delays.

In February, 1891, at a meeting of *The Institution of Civil Engineers*, in London, during the discussion on "Electric Mining Machinery," Mr. John Taylor said he did not intend to take part in the discussion with regard to electrical machinery generally, but he was able to give some facts which would be of interest, because they were the results of working mines upon a considerable scale during a period of several months. He referred to some gold mines in California, the property of a company of which his firm had the management. They had been abandoned for some years, in consequence of the impossibility of working them to a profit by steam power, the ores being of low grade. The matter was brought to his notice two years ago by Mr. G. Cullen Pearson, who was interested in the mines during the period of their working by steam power. Mr. Pearson saw the future possibility of the transmission of power by electricity, and secured, in addition to the interest he then had in the mines, water power at a distance of about two miles. This was utilized by a Pelton wheel 87 inches in diameter, and capable of developing 125-h. p., with 400 miners' inches of water under a pressure of 110 feet. This wheel drove a Brush generator of 100-h. p. The current was transmitted to the mines, which were at an elevation of 1400 feet above the power station, and a distance of 10,890 feet (just over two miles), by a No. 3

insulated copper wire less than a quarter of an inch in diameter. The wheel and the generator were capable of developing 125-h. p., but they were not working up to that. The exact length of wire to complete the circuit was 22,588 feet, or four miles and one furlong. At the mines there was a Brush motor working up to 60-h. p. actual. It drove a ten-stamp battery, and three Huntington mills besides, equal in all to a forty-stamp battery, and there was also a large rock-breaker. In addition, all the mills and buildings were lighted by incandescent lamps by the current taken direct from the transmitting wire. The power required for running the machinery as at present used was from 41 to 43 electric h. p. There were ammeters and voltmeters placed both at the power-generating station and at the mills by the Brush Company, who put up the plant, and they were guaranteed by them to be correct. The electricians present would be able to give their opinion as to whether there could be anything questionable in the results given by these instruments. Mr. Pearson had himself made numerous observations by means of a telephone from the generating station to the mines, and Mr. Taylor had received from him particulars of one taken on the 12th of January. At the power generator there was registered 29 amperes at 1250 volts, equal to 48.47 electrical h. p. The current at the mills at the same time was 28 amperes and the pressure 1100 volts, equal to 41.47 electrical h. p., so that practically they were receiving at the mills from 83 to 85 per cent of the h. p. generated as actual working energy, at a distance of over two miles. They were confidently told by the electricians who put up the machinery that a wire two sizes larger would give from 2 to 5-h. p. additional. They might therefore talk about 90 per cent of the h. p. at a distance of more than two miles. Mr. Pearson had mentioned a variation of from one and a half to two per cent in the power delivered, which, it appeared, was dependent upon atmospheric conditions. It might be easily understood that there was a larger efficiency in cool dry weather than on a warm, damp day. The electricians of the Brush Company stated emphatically, after the work had been going on for some time, that they might safely reckon upon 70 per cent of the h. p. at a distance of 12 miles. The experiment was not a small one; the work had been going on since August, day and night unceasingly. They had a good deal of trouble at first, but after everything was in order they went on without a single interruption. The most remarkable thing was the small amount of wear and tear, which appeared to be confined to the copper brushes and the copper segments of the commutators. Mr. Pearson had given the whole expense of the renewals and for oil at only \$25 per month, which was, of course, a mere trifle. He had proved, during that period of five months, that he required no skilled men. Two miners had been instructed, and they attended solely to the machinery where the Pelton wheel and the dynamo were working. Up at the mill, there was no supervision whatever of the motor beyond one of the men going in to see that the oil cups did not run empty. The machinery, Mr. Pearson stated, was entirely under control, and in all his experience he had never had to do with a motive power which could compare with it for economy, cleanliness, steadiness and the ease with which it could be handled. Between the 1st of August and the 31st of December the machinery had dealt with 19,000 tons of rock. The gold was extracted at the remarkably low average cost for mining and milling of 50 cents—or 2s. 1d.—per ton, heating, as far as Mr. Taylor's experience went, any record even where there was water power close to the scene of operations. It would be readily understood that there was an enormous field opened up for working mines and many other industries under similar conditions. Mr. Pearson's statement was a remarkable one, and he placed it before the Institution as the actual result of a large operation over a considerable period.

We add: That the mill crushed 43,000 tons of rock in the 13 months from July, 1890, to Aug., 1891. In Oct., 1890, there was crushed 4448 tons, which were mined and milled at the total cost of 43 cents per ton. View No. 1 shows a part of the Dalmatia mill.

The 43,000 tons were taken from the open cut, shown in View No. 4 on the first page, pending development work below. This cut is 50 feet wide and 75 feet deep.

In 1891 the syndicate acquired the St. Lawrence mine, 3.6 miles from the Dalmatia (exact distance 19,100 feet), and ordered from the Electrical Engineering Co. of San Francisco, which had succeeded Prof.

(Continued on page 65.)

F. A. HUNTINGTON.

PATENT ORE FEEDER. CENTRIFUGAL ROLLER QUARTZ MILL.

This Feeder is especially designed to feed the Huntington Roller Quartz Mills; it is simple in construction, and while in motion can be easily adjusted to feed fast or slow; it has but few wearing parts and its positive movement makes it the best Ore Feeder now in use.

The Following will Explain the Above Cut:

The ore and water being fed into the mill at the hopper A, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

F. A. HUNTINGTON,

MANUFACTURER AND DEALER IN

STEAM ENGINES AND MINING MACHINERY OF EVERY DESCRIPTION.

OFFICE AND WORKS, 213 TO 219 FIRST STREET, SAN FRANCISCO, CAL.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 2000 IN ACTUAL USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

THE PELTON WATER WHEEL CO.

MARSHUTZ & CANTRELL.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

ELECTRIC BLASTING.

Send for Catalogue.

PARKE & LACY CO., San Francisco, Cal., AGENTS.

VICTOR ELECTRIC PLATINUM FUSES.

Superior to all others for exploding any make of dynamite or blasting powder. Each fuse folded separately and packed in neat paper boxes of 50 each. All tested and warranted. Single and double strength, with any length of wires.

VICTOR BLASTING MACHINE. - Made in two sizes. No. 2 fires 20 to 30 holes. No. 1 fires 5 to 8 holes. Adapted for prospecting, stump blasting, quarry and general railroad work.

"PULL UP" BLASTING MACHINE. - The strongest and most powerful machine ever made for Electric Blasting. No. 4 size fires 70 holes. No. 3 size fires 40 holes. Are especially adapted for submarine blasting and large mining work.

Standard Electric Fuse and Blast Tester. Wire Reels, new design, Leading and Connecting Wire.

— MANUFACTURED ONLY BY —

JAMES MACBETH & COMPANY,

128 Maiden Lane, New York City.

PLACER AMALGAMATORS

Combined with Steam Shovel or Dredge.

BUCYRUS SYSTEM.

NEW METHOD OF PLACER MINING.

Saves all the Gold. Uses very little Water. Treats large quantities at Low Cost.

Mining and Milling by Electric Power.

(Concluded from page 62.)

Keith's business, a 25-h. p. Keith motor to run the mill which the syndicate erected at the St. Lawrence.

Accordingly the line was extended from the Dalmatia mill to the St. Lawrence by running upon suitable insulators on poles 38,200 feet of No. 3 bare copper wire, and the motor, shown in Fig. 6 on page 65, was installed and started on the 30th day of Oct., 1891, and has run successfully ever since. The total distance from the power station at Rock creek to the St. Lawrence mill is 29,990 feet or 5.68 miles.

The Electrical Engineering Co. undertook the problem of adjusting the Brush apparatus so that it would work in harmony with the Keith motor, and also furnish a suitable current of electricity to light the office and residence of Manager Pearson, located midway between the Dalmatia and St. Lawrence, and also the St. Lawrence mill.

As the motor made by the Electrical Engineering Co. was made to run and govern perfectly on 30 amperes of current, all the other things were made to do the same, except the Brush motor. But that was so adjusted that, while it is not self-regulating, suitable movements of the brushes manually made, keep the speed approximately at the normal when changes in the power are made.

The circuit consists of 59,980 feet of No. 3 copper wire, the dynamo and fifteen 16-candle power lights at the Rock Creek station; the motor and thirty 16-candle power lights at the Dalmatia mill; thirty 16-candle power lights at the superintendent's residence and office, and the Keith motor and fifteen 16-candle power lights at the St. Lawrence mill.

The "Automatic Man Regulator" is continued at Rock creek and will be until the contemplated changes and additions have been made. The loss of power due to the transmission, that is, that which is absorbed by the wire, is constantly 12.06-horse power.

for battery purposes is attainable. Until the mine is put into working order the mill, shown at the left of the View No. 3, will be run on material from the dump.

View No. 2 on the first page shows a part of the Rock Creek ditch. Much of the ditch was cut through solid rock as there shown. We are indebted to Mr. Horace E. Levesley, who is shown standing on the bank of this

within many miles radius. He has already applications for many hundreds of horse power within ten miles of his power station. He is so well satisfied with what has been done for the syndicate by the Electrical Engineering Co., and with its success in the matter of electricity for mining purposes, that the Brush apparatus will be replaced by that of the Electrical Engineering Co.,

When we shall have seen, within a few years hence, the many hundreds of thousands of horse power available in our mountain streams utilized for mining and other purposes by means of electricity, this plain recital about the first essay of the kind will not have lost its interest.

Mining Share Market.

Comstock mining shares exhibited more life the past week, with the entire line moving up. The advance in the market can be traced both directly and indirectly to the action of the combination of leading brokers not controlled by pools and rings. The object of the combination is, so far as the writer is able to learn, to make the pools and rings that have been victimizing the outside shareholders and looting the mines, enter the market and buy the stock with which to control the mine or mines, and in this way they look for much healthier times. They will also try and force mine managers to have the mines worked and the ore milled to conform to the laws of California, under which the companies incorporated. That the brokers' movement promises good results is witnessed in the more active mining share market, and also the reports of mining superintendents beginning to be fuller and much more satisfactory. When these reports give mine or car sample assays, and other particulars, together with width and assays of all ores found, then a reformation is secured and outside dealers will have more confidence in the market. Until this is done, dealing in stocks is very risky and one-sided—assessments for the public and bullion for inside pools and rings.

There can be no question but inside stock pools and rings contemplated sending the market for mining shares to the low prices put out through cappers, but the brokers' combination prevented it. It is deserving of special mention that heretofore inside pointers have been recently wrong, which shows that the market does not move altogether their way. Outsiders should stand in with the brokers who are fighting for an improvement in the management of the mines. It is the only way in which the long-desired better times can be brought about.

Outside mining shares have ruled dull and heavy. It looks as if there will not be an improvement in that direction until the brokers force mine managers to enter the market and buy their stocks in same way that Comstock mine managers are being compelled to do.

At the annual election of Sierra Nevada, held on yesterday, the ring voted 3250 shares of stock and nearly 70,000 in proxies. One broker firm, Reh fish & Co., alone gave their proxies amounting to nearly 30,000 shares. A. G. Gurnett, for the broker combination, voted nearly 25,000 shares and proxies from actual owners. The total number of shares and proxies voted was 98,724. This is a good commencement for the brokers, for they secured one director. It is said they would have secured two had it not been for John Wall's "falling down."

The Mining Stock Association have forwarded to Congress a full list of the "unknown" bullion which was put through the Carson Mint for the mill ring, and also the names of the guards that let Evan William into that institution at midnight, and have demanded an investigation of the whole matter, that it may be made public to all stockholders.

It is currently reported and believed that inside rings paid some brokers 5 to 15 cts. per share for their proxies to be used in the Sierra Nevada election.

News that is coming to hand from the Comstock mines, is more encouraging. To be sure it is old—known to miners for many months, and in some instances for several years, yet it shows that good results are following the developments in M. W. Fox's suit against the directors of the Hale and Norcross Mining Co., and also the sustaining by the Supreme Court of California, of the validity of the laws under which mining companies are incorporated, and that these laws must, in all particulars, be conformed to. A few more suits by outsiders for damages against mine directors ought to be brought, so as to make them realize they are not above the law, and are not to be used as cat's paws. The Nevada mill, of 60 stamps, is running on ore from Hale and Norcross and Savage. Will this mill run the annex? If not, why are the car sample assays not given? It is given out that there is an improvement in its west cross cut, being run by Hale and Norcross on the Sutro tunnel level. This is confirmatory of the MINING AND SCIENTIFIC PRESS assertion of finding many months ago in the Middle mines of a 40 to 50 foot ledge to the west. Every statement heretofore made by us about the west ledge, will, in time, be verified. Probably this will come about when the mill rings find they cannot get away with the bullion. About a year ago this paper stated that work on the 1750 foot level in Con Virginia would develop to the west high grade ore, now it is being confirmed officially, but of course its recent find is accidental. Sierra Nevada reports better prospects, as does Mexican. Chollar reports richer ore on its lower level. Potosi reports early officially the finding of ore, published by the PRESS early in last year. The ore found in the Ward shaft has not, as yet, been officially reported. The secret work in the Gold Hill mines, is very important, but probably it will not be made public until after another line of assessments is levied and collected. The Alta group, if differently managed, would be paying dividends. We are in receipt of confirmed advices of a decided improvement in Overman, but it fails to be mentioned in the official letters. The water in the Gold Hill and South End mines is being pumped out more rapidly. The water could have been taken out several months ago, had the managers desired, but then they would not have had an excuse for levying assessments.

From the outside mines official letters report still higher assays of Bulwer ore. This mine if properly managed, ought to pay dividends soon. More favorable news is received from Bodie and Mono. From the Quijotas official letters report the mill running steadily and that the ore assays higher. The "Razor Blades" do not report any change. Usual high assays, but no dividends continue the rule from them.

Mining shares opened this (Thursday) morning active and higher. After regular call there was continued activity with still higher prices reached.

THE KEITH MOTOR.

120-HORSE POWER DYNAMO FOR ELECTRIC POWER TRANSMISSION.

The wire costs at present prices about \$1700. If the wire was twice as heavy, cost say \$3400, the loss would be but six-horse power. But as the power at Rock creek is abundant, the extra expenditure is at present unnecessary. Whenever all the power attainable can be utilized, the returns will be worth the expenditure.

This power is essentially necessary to the St. Lawrence, because under steam power no rock paying less than \$9 per ton could be profitably mined and milled. The mine is at such an elevation that no direct water power is available. Barely sufficient water

ditch, for these and many other photographic views of the mines, mills, etc., operated by this electric plant.

Mr. Pearson has acquired the use of 6000 inches of water from the American river, and is constructing a ditch to bring it to a fine location at the mouth of Rock creek for a power station. Owing to the precipitous banks of the river, and the lack of fall at other places, he has the only considerable water power on the river for many miles. This amount of water will give him 1500-h. p., which he will sell at acceptable rates and deliver electrically to the mines and mills

and the additions will also be made by it. Electric pumps and electric rock-drills, as well as electric hoists, will be erected by the latter company for the syndicate. This company is now installing electric pumps, drills and lights for the Idlewild Co. at the Taylor mine, seven miles from the Rock Creek station.

Our view No. 7 shows a 120-h. p. dynamo, made by the Electrical Engineering Co., and such as will be installed at the Rock Creek and American River stations. It is perfectly self-regulating, even under great changes in speed of rotation.

Langbein's New and Splendid Book on the
Electro-Deposition of Metals.

JUST READY.

A COMPLETE TREATISE
— ON THE —

Electro-Deposition of Metals

Comprising Electro-Plating and Galvanoplastic Operations, the Deposition of Metals by the Contact and Immersion Processes, the Coloring of Metals, the Methods of Grinding and Polishing, as well as Descriptions of the Electric Elements, Dynamo-Electric Machines, Thermopiles, and of the Materials and Processes used in every Department of the Art. Translated from the German of Dr. Georg Langbein, with additions by William T. Brant, editor of the "Techno-Chemical Receipt Book." Illustrated by 125 engravings. In one volume, 8vo, 404 pages. Price, \$4.00.

Free of postage to any address in the world.
A circular of 6 pages, quarto, giving the full Table of Contents of this important Book, with specimens of the illustrations, will be sent free of postage to any one in any part of the world who will furnish us with his address.

SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHS.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Glohe Cases, free of cost, by applying to the manufacturers.

Dewey & Co., Patent Agents.

Reasons Why Pacific Coast Inventors Should Patronize this Home Agency.

It is the ablest, largest, best, most convenient economical and speedy for all Pacific Coast patrons.

It is the oldest on this side of the American continent, most experienced, and in every way reliable.

It has the largest library of Patent Law books, American and Foreign Patent Office Reports, scientific and mechanical newspaper files, latest works on science, art, inventions, and mechanical and other new discoveries.

The MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS, published at this office, give well-written, timely and wide-spread information of all worthy inventions, whenever desired by patentees.

Conducted from 1863 by present owners, this agency has the best knowledge of patents already issued, and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries, throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, pride and due acknowledgments. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other can afford Pacific States inventors half the advantages possessed by this old, tried and experienced firm.

BOOKS ON ASSAYING.

By C. H. AARON.

Part I.—Gold and Silver Ores.

SECOND EDITION—PRICE \$1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning. The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Luthers; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of Dressing; The Melting in Crucibles; Scorchification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth. Price, \$1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.

Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.

SECOND EDITION—JUST OUT.

Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gold Lassa's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new, original and exact as is also one of the processes for Zinc. The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, \$1.75. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market St., San Francisco.

MINERAL STATISTICS FOR 1891

Get the Annual Statistical Number of

THE ENGINEERING AND MINING JOURNAL.

These statistics are published a year before those collected by the Government, and are the only statistical reports obtainable. Everyone is interested in knowing all about this great mineral industry, where the minerals and metals come from and where they go to, their values, uses, properties and products.

An Indispensable Reference Book. COPIES, 50 cents. Bound in flexible cloth, \$1.00. THE SCIENTIFIC PUBLISHING CO., 27 PARK PLACE, NEW YORK.

Practical Treatise on Hydraulic Mining.

By AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdy, rockers, undercurrents, etc.; also describes methods of blasting, uncles and sluices; tailings and dam; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, postpaid. For sale by DEWEY PUBLISHING CO., 220 Mark et St. San Francisco.

FRUE ORE CONCENTRATOR

OVER 8000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

Manufactured under Patents of April 27, 1880;
September 18, 1883; July 24, 1888;
and March 31, 1891.

Price of Plain Belt Frue Vanner, \$575, f. o. b.

Price of Improved Belt Frue Vanner, \$825, f. o. b.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs," for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

JOSHUA HENDY MACHINE WORKS,

39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

CERTIFICATE—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices.

DAVID McKAY, Jr.,
Supt North Star and Original Empire Mining Co.
N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty eight (28) are now in constant successful operation.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - \$650 f. o. b.

Price "Triumph" Concentrators, with Plain Belt - - - \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Concentrating Belt manufactured in San Francisco; we can therefore fill all orders on short notice. The length and width of these belts are the same as is used on the Frue or Triumph Concentrating Machines, but can be made of any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

The State Officers.

J. H. Neff of Placer county, who has been elected President of the California Miners' Association, has been in California since 1850, residing all that time in the county of Placer. He is a Pennsylvanian by birth, but lived ten years in Iowa before coming to this State. Mr. Neff has devoted himself to both quartz and drift mining ever since he settled in California and is a thoroughly representative miner. He has also held several official positions and is at present one of the State Prison Directors.

Mr. Neff was in Auburn when the initial movement toward this State Miners' Convention was made, and was elected chairman of the caucus or meeting which issued the call for the Placer County Convention. When that was held he was elected chairman of the convention, and of the Executive Committee which issued the call for the State meeting.

As chairman of that Executive Committee, the duty devolved upon him of calling the State Convention to order. He was then chosen temporary chairman and subsequently permanent chairman. On the California Miners' Association being perfected he was chosen President, both as a token of personal appreciation and as a compliment to the county he represented.

Mr. Neff made an excellent chairman of the convention and performed the duties to the satisfaction of all.

W. C. Ralston, the Secretary of the California Miners' Association, was born and educated in San Francisco. His first work was as an assayer in the Selby Smelting Works, where he was engaged for a year. He then worked a hydraulic mine for four years in Placer county, above Michigan Bluff. Subsequently he became Superintendent of the drift mines about 12 miles above Forest Hill, belonging to the Societe des Mines d'or du Forest Hill Divide, Eugene Renevey, President, head office, Paris, France. Mr. Ralston remained at these mines two years, when he came to this city. He is a practical miner and has always been interested in the mining industry. His father, W. C. Ralston, of the Bank of California, was one of the best known men on this coast, and largely interested in mining property. He had large investments in the North Bloomfield and Milton hydraulic mining companies,

and was one of the first to put money into opening the Bloomfield property.

Young Mr. Ralston acted as Secretary of the San Francisco delegation, and was urged by many friends from various counties for the Secretaryship of the State Convention. He acquitted himself so well in that position that he was unanimously chosen as Secretary of the permanent State organization. A great deal of labor has fallen on him in the past few weeks, for the cause of the miner, but he has done his work well and promptly.

A Kindly Feeling.

There have been more pleasant and kindly notices of mining interests and mining men of California within the past week, from the press of the State, than has been the case in the past ten years. Not only have the great dailies of San Francisco and other large cities discussed the subject in a favorable way, but the journals of the interior, in both mining and farming communities, have had good words for the miner and his business.

All this augurs well for our mining industry.

The Quartz Interests.

Some of the quartz miners who attended the convention, were of the opinion that the hydraulic interests overshadowed to too great a degree, the other branches of the mining industry. This was, however, to have been expected, since it is the hydraulic mining branch, over which there has been the most litigation and dispute. It was that branch too, on which the report of the Government engineers was based, and the one which had been practically annihilated by the decrees of the courts.

The quartz interests, however, were by no means overlooked. Various resolutions relating to unjust department decisions, rulings, etc., were formulated; also others concerning the "paying mine" proposition, "valuable mineral," the disputes between agricultural and mineral claimants, and the mineral on railroad grants.

It was thought, however, best to give these subjects more careful consideration than could be the case in a crowded and hurried convention. All the resolutions concerning these legal branches of the subject were referred to a very competent committee who will at once formulate them properly. Their report will be forwarded to our Representatives in Congress, and the committee of the California Miners' Association which goes to Washington very shortly will aid as far as possible in seeing them properly recognized by the mining committees of Congress.

OUR Congressmen from this State will have to "rustle" this session. The several committees sent on by the Mining and River and Harbor Conventions will give them plenty of work to do. If these Congressmen want to make any "records" for the benefit of their constituents they will have an opportunity to do so under the immediate observation of committees of said constituents. But if they show lack of interest or fail to lend assistance they will be apt to hear of the subject on a future occasion.

JUDGE J. M. WALLING of Nevada county took the most active part in framing the constitution and by-laws of the State organization; and, in fact, it was due to his presence on the committee that the work was done so promptly, and the document produced so concise in form.

Hon. J. H. Neff, President.

W. C. Ralston, Secretary.

PRESIDENT AND SECRETARY OF THE CALIFORNIA STATE MINERS' ASSOCIATION.

The engravings on this page are from recent photographs of the gentlemen.

A DEPARTMENT OF MINING.—Congressman Camminetti, of this State, will shortly introduce a bill creating a new department and adding one member to the President's Cabinet. The object is to develop and take better care of the mining interests of the country. The new Government division will be known as the Department of Mines and Mining and the official in charge will be called the Secretary of Mines and Mining. He will have an assistant, and the salaries of both will be the same as those of the other secretaries and their assistants. The bill takes the Mining Bureau, including the sale of mineral lands and the Geological Survey, from the Interior Department, and the Mint Bureau from the Treasury Department, and places them in the new section of the Government. If the bill passes it will go into effect on March 4, 1893.

The miner has placed before the public his grievances and his needs, and the questions are better understood than ever before. To a class which has been ignored or persecuted for years all this is refreshing and pleasant. It was not supposed by many that such a kindly feeling really did exist, but that it did is evident from the tone of the press.

All that was wanted, apparently, was a plain, concise statement of the conditions, from the miner's point of view. He has not always had the chance, it must be confessed, of making this statement from his point of view. Therefore the press and public have not been heretofore properly informed. The proceedings of the convention were such as to attract universal attention, and the miner's side has been so temperately and sensibly set forth as to bring conviction to most minds that his interests need the assistance of the press and public.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Ed.

The Oil Wells of Kern County.

SAN FRANCISCO, Jan. 23, 1892.

TO THE EDITOR:—The monotony of travel through the San Joaquin valley is only for those who see nothing interesting in agriculture or horticulture. To those whose business or inclinations are in these lines, the journey affords the full measure of delight. There are certain phases, however, which interest even the indifferent, and, fortunately for me, a stopping-place on my trip was at Bakersfield, the most important place in the southern part of the valley. Although Bakersfield and the surrounding country possess certain great advantages, investors and actual settlers have not availed themselves of them so extensively as has been the case both north and south of here. They are coming, however, in constantly increasing numbers, and when they come they generally stay. By the kindness of J. S. Drury, Esq., I was shown a portion of the irrigating system in this vicinity. The water supply is far in advance of the settlement, which is generally the reverse in most sections.

THE CANALS AND BRANCHES

Are over 300 miles in length. One canal, the Calloway, is 100 feet wide on top, 80 feet on the bottom and 8 feet deep. The flow of water through one of the smaller canals generates power to operate the machinery of a large flourmill, this being the only utilization so far of the tremendous available water power.

Kern river, flowing through this country, furnishes an abundant supply of water to the canals and ditches, and what is remarkable, and probably the only case of the kind, it furnishes a fertilizer, and one of the best known, viz.: gypsum. This is caused by the course of the river being through vast deposits of this material in the mountains and foothills, which is disintegrated by the action of the flowing water and the fine particles carried along and distributed on the soil wherever the water is used for irrigating. Water is a necessity, but the fertilizer is a luxury, and that the soil appreciates it is shown by the surprising growth of fruits and vegetation where it is used, as instanced in the fine exhibition at Drury's drug store of fruits preserved in an antiseptic liquid, which has, unfortunately, destroyed the natural color, which on the peaches was unusually brilliant. The size, however, of the fruit excites wonder; some of the peaches, for instance, are more than 13 inches in circumference and weigh over 22 ounces. These peaches were raised by Mr. C. A. Maul, who ascribes the success of himself and others largely to the natural conditions here extant. In concluding this brief outline of the subject, allow me to advise you to make a personal inspection, and I can assure you a pleasant welcome, for the people are as "fine as the fruit," and that is the highest degree of praise.

THE SAGEBRUSH PLAINS.

Now for the oil wells, the objective point of my visit to Kern county. The Sunset Oil Co.'s property is about 45 miles in a southwesterly direction from Bakersfield, the nearest railroad shipping point. The road is over a level country and the through trip can be made in six or seven hours with a good team and light load. Teams heavily loaded require a day and a half or two days. After leaving the irrigated district, which extends 10 or 12 miles out from Bakersfield, and which is marked by some beautiful homes and fine farms, the scenery consists of an almost dead level sagebrush covered plain, broken on one side by Buena Vista lake and on the other and ahead by the foothills of the Coast Range. The denizens of this plain are coyotes, jackrabbits, birds, etc., which have plenty of time and the proper means of locomotion to cover long distances in search of water, for after leaving the Half Way House (22 miles from Bakersfield) there is no drinking water until the Oil Wells are reached, and it is hauled there from a spring 8 or 10 miles beyond in the foothills. If the sagebrush plain is uninviting, nature shows no inclination to make amends in the country immediately surrounding the Oil Wells. On the contrary, she seems to have attempted a climax of offense to the senses of sight, taste and smell.

MALTHA OR MINERAL TAR

Flows and oozes from crevices and seams in the broken and upheaved rock formation, forming pools and patches acres in extent. In course of time, by oxidation and evaporation of the volatile constituents, the mass is solid and hard in cold weather, but soft and sticky under the rays of a hot sun, forming a trap more cruel than quicksand

to any animal so unfortunate as to be ensnared in the black, viscid compound. Quicksands draw their victims beneath the surface and end their misery, but here they are held until they perish by starvation or thirst. Bones of bears, cattle and other animals are found, and even some thought to be of human beings. Springs and streams of water in the vicinity are impregnated with sulphur and various salty, alkaline, and in some cases arsenical compounds, which render them repugnant in taste and odor and often poisonous. Where pits have been excavated in the sulphur deposits, the air is laden with fumes resembling those of burning sulphur.

THE SUNSET OIL COMPANY.

The foregoing are the first impressions of a superficial observation. Discriminating, practical minds see great utility in these unseemly products of nature, and operations of the Sunset Oil Co. shows a combination of capital and intelligence, which has established a very promising industry, and money is being freely expended to widen the field of operation. They can furnish an immense quantity of excellent asphalt for which there is great demand.

Its various applications already numerous are being constantly multiplied. Varnishes and paints made from it are noted for their gloss, durability, tenacity of adherence and resistance to moisture. Posts, tiles, iron pipe or other iron articles, ships bottoms, or in fact any article or material is protected by it, from the action of salt or fresh water or acids, and is used for water-proofing cloth. Being a nonconductor of electricity it will find extensive use as an insulator. A mixture of asphaltum and sand moulded under hydraulic pressure, has a resisting strength of 250 pounds to the square inch, and water pipe made in this manner is incomparable in many respects. Vast quantities are used for street pavements, sidewalks and roofing.

At the coal mines are millions of tons of "waste" or powdered coal which can be made an excellent and cheap fuel by intermixing a small per cent of asphaltum and forming into blocks. The above are a few of its uses, and the fact that nine-tenths of the asphaltum used in the United States is imported from the island of Trinidad, shows the value and necessity of all developments in California. An order for 30,000 barrels of oil awaits the company's option, and in fact the demand for its products is like the supply almost unlimited and the prices good. Quite a force of men, 30 or more, has been employed at good wages. The individuals of the company have won admiration by their enterprise and success. They have added to the taxable property of Kern county and the trade of Bakersfield. The asphalt can be laid down at nearest railroad shipping point (Sumner) at a cost not exceeding \$20 per ton. At Chicago, Kansas City and other Eastern points it sells for \$60 per ton. The railroad freight tariff to Eastern points is \$40 per ton, presenting the amount of profit due to the enterprise, a state of affairs which we hope will be remedied. It is due to the railroad company to say that \$40 is their schedule price for transportation and a lower rate would be a concession on their part, which would show a willingness to encourage an industry which would add to their own business and be a profit to others.

The sulphur is also barred out of the San Francisco market by a rate as against a \$3 rate from Japan, which now supplies the California demand. It will be seen from the great store of natural products the owners of these properties could draw dividends for an extended period of time, provided transportation was cheapened. That it soon will be, is probable, as preliminary work on a competing line has already been done in Tejon Pass, and a convention has been called to consider the building of a railroad from Bakersfield to Port Harford. As regards actual operations the Sunset Co. has been pumping a heavy oil termed maltha, from five wells which vary from 90 to 300 feet in depth, and probably having a capacity of 50 or 60 barrels per day. This maltha is used in the

MANUFACTURE OF THE REFINED ASPHALTUM

Two barrels being added to a ton of the crude material, the mixture being boiled in iron vats, the impurities are allowed to settle, the clear asphaltum being drawn off into wooden boxes for solidification, and is then ready for shipment. The remaining refuse is the fuel used in the furnaces. Twenty-four hours is required for each run, the present capacity being about 12 tons per day.

By an ingenious device the five wells are pumped simultaneously, although some are 100 feet or more from the engine. Wooden rods, one end attached to the mechan-

ism at the well, are connected at the other end to a wheel with a reciprocal motion which is actuated by a pitman rod, operated by the driving wheel of the engine.

In closing I wish to acknowledge the courtesy extended to me by Mr. H. A. Blodgett of Jewett & Blodgett, bankers, the Messrs. Hambleton, Skelton and other friends. V. C.

Who Invented the First Hydraulic in California?

SHADY RUN, Jan. 15, 1892.

TO THE EDITOR:—I have heard of a dozen or more of miners, in as many different localities along the gold belt, who each claim to be the first inventors. Was it an invention in the early stages of the process? All we have of its early history is in scraps, and comes to us second-handed; and as no patent was ever obtained or applied for, it has always been an open question.

Perhaps no better opportunity will ever be offered for learning something about the early history of hydraulic mining, from the living actors, than at the meeting of miners in San Francisco on Jan. 20th, where representative miners from every locality in the State will be in attendance. As hydraulic mining will be a prominent subject for consideration, its early history may be interesting to many who have never seen anything but the Monitor and Giant at work. The probability is that many of the old timers will be on hand at this convention, from whom a record could be obtained of their experience and observation in regard to the first hydraulic mining in their respective localities.

[Being unable to attend said convention, I hereby tender my best wishes for the success of this movement in the right direction, and hope by "keeping it before the people" and Congress, the object can be speedily accomplished.]

For a starter on the subject of the first hydraulic mining in the locality where I then lived, I herewith give my experience.

In the season of 1853-54, we were working our claims at Indiana Hill by ground-sluicing, washing the bank off in benches eight or nine feet in depth, running the water over the bank in a broken stream. After working down two benches, the spray from the water falling such a distance made it uncomfortable for the men working next the bank. To remedy this, I procured a piece of six-inch hose to convey the water over the bank. After getting down a cave, I would take the lower end of the hose and compress the outlet as much as possible with my hands. I perceived this gave much more force to the water, and made an improvement on this by constructing a square tapering box about four feet long, with the discharge outlet two inches square, nailing the hose on to the large end. This worked well. We could wash off a cave with this contrivance in half the time required in the old way with shovels.

About this time there was talk of great improvements having been made in placer mining about Nevada City. I made a trip over there to see if I could get a clue to any of their improvements.

All that I saw that was new to me was: A man by the name of Laird (I think that's the name) had about 50 men employed shoveling the shallow surface gravel into a ditch, constructed with sufficient grade to carry off the dirt into his sluice boxes. This worked well, but would not apply to our diggings.

From Nevada City I went to Grass Valley; saw nothing new there. Thought I would have something new made, so I went to a tin shop owned by "Mc—." There were so many "Mcs" about Grass Valley at that time that I don't remember which Mc it was. Well, the Mc I have reference to owned a hardware store and tin shop. I got him to make me a sheet iron discharge pipe about four feet long for a six-inch hose, with 2-inch discharge outlet.

On my return to Indiana Hill, I substituted the iron pipe in place of the wooden one, and made a great improvement by adding about 20 feet more pressure. I constructed a frame in a pine tree near the bank, on which I set a barrel and made a taper to the hose so as to nail it on the lower end of the barrel; a few boxes from the ditch to convey the water into the barrel and the rig was complete. We turned the water on, and to the surprise and disappointment of some who termed it "boys' play," and who a few years later considered themselves the biggest hydraulic miners about the diggings, it worked like a charm. The gravel in our claims was soft and easily piped, but when the gravel was piped out, the bank presented a face of big rotten boulders that required the pick and bar to remove, which was somewhat dangerous in this kind of ma-

terial, a cave frequently coming down without warning.

To avoid any serious accident, the use of the pipe was discontinued in the bank, but for washing off the dirt after getting down a cave it was successfully used until our claims were worked out. One man handled the pipe and all the others had to do was to remove the boulders, which we found to be a great saving of labor and time.

Some of the company objected to using the pipe on account, they said, of the quantity and force of the water carrying off the gold, but after a few cleanups they withdrew their objections.

I did not then, neither do I now, consider this in the light of an invention. I had worked with a rocker in the rich, shallow diggings where there was but little dirt to handle—had worked shoveling into the long-tom, in banks of the canyon, and worked with the pick undermining the bank for a cave in the deeper deposits in ground-sluicing. Now I had merely substituted the pipe for the pick in the same process. It was only adapting the methods to suit the conditions.

One process seems about as complete in its line as the others. It is only on this line of reasoning that I can account for so many different claimants to the original invention of the hydraulic. Under like circumstances, a score of miners in separate localities probably worked right along up into this improved process about in the same way that I did. Considering the limited intercourse between the miners at this time, this view appears to be sustained.

The miners in one camp, intent on working their claims in their own way, knew nothing, and cared less, about what was being done in other camps.

Forty years have wrought many wonderful changes. In no place is the change more conspicuous than on the gravel range from Indiana Hill to Dutch Flat. There was no Dutch Flat town—a few miners' cabins, a log storehouse where the miners got their necessary supplies of groceries, pork, beans and whisky. The town of Gold Run was not dreamed of. Forty years ago the millions of gold in this gravel range was covered by a dense forest from the North Fork to Bear river. The first evidences of the destruction of this forest were to be seen on the line of the Indiana ditch from Canyon Creek to Indiana Hill, where we had cut a few poles and trees to fix up our camps. [This was the second ditch on record in Placer county, the Bear River ditch to Auburn being the first.] We completed our ditch, got the water onto our claims at Indiana Hill, and opened them in good shape. From the pay we were getting here and the developments being made on the Bear River side, and the prospect in fine gold that could be got all along the gravel range on the surface, I was confident that a vast amount of gold lay there idle awaiting the development of some method to get it out and put it into active service. The question was, how could a sufficient quantity of gravel be run off and the fine gold saved to make it pay. Miners in those days were not "built" to give up nor stand still. We formed a small company to attack the deep gravel deposit, about one mile north from Indiana Hill. The location was on a point between two ravines that run into Canyon Creek, and was called Dubuque Hill. The members of the company were O. Harkness, G. Richie, myself, and a few others whose names I have forgotten.

We set up our rig, had about 75 feet pressure, and got a discharge pipe from Sacramento, such as are used on fire engines. It worked very nicely, but not very strongly. The gravel was pretty hard and there was too much of it. As a financial scheme, the experiment proved to be a failure.

After this, several small rigs were put up in several places on the flats at the head of small ravines, washing off from 5 to 20 feet in depth of the top soil and fine gravel, some of which paid well.

Just how and when the term of "hydraulic mining" was first applied to this process here I have no recollection. I think it was probably an imported term from other diggings. We called it ground sluicing for some time after the pipe replaced the pick, albeit the term is significant and has come to stay.

From these small beginnings, step after step improvements were made, iron pipe and the water-box replacing the canvass hose. Then comes the monitor and giant, true inventions, the results of the inventive genius of California miners. Many of the old actors have slipped from the walk-board and been carried down the flume and over the dump, but some of the "old boys" are still here to establish the truth of this narrative in regard to the early history of the now noted hydraulic mines of Gold Run and Dutch Flat. Next! J. F. TALBOTT.

A Plan to Get Rid of Debris.

STOCKTON, Jan. 18, 1892.

TO THE EDITOR:—I would like to present for consideration a plan by which our mines now lying idle can be worked and not fill up the rivers and endanger the valleys by flooding them with the debris from the mines. I will accomplish three great and valuable results to our State. First, to mine by the use of water, called hydraulic mining, the vast bodies of gravel. Second, I would furnish an unlimited amount of water to be used for irrigation, making the foothill lands of great value for homes for millions of people. Third, I would retain the debris in waste places, making valuable lands of the same, now worth nothing. The following plan I respectfully submit, believing it original and the only plan by which the results mentioned can be attained. My plan is the following: To put in the river just under where the flow of water and debris would enter the river a permanent dam. Cut a channel north and south that would carry the flow of the waters of the rivers, other than at flood-time, say one-half of the year; these channels carried at such a distance as might be needed, all the water that might be needed or used for irrigation could be used anywhere under this channel; wherever used it would leave the debris on the ground to mix with the land and enrich the same. Any one familiar with the foothills knows that everywhere, as often as every mile, are ravines to drain the same. Every one knows there is no end of the waste places in which a dam could be placed across to retain the debris from the mines, as well as the natural wearing down of the mountains, and in these waste places or valleys to make thousands of acres of the best and most fertile land. I believe, that land could be really made, so to speak, the value of which would pay the expense, or a long way toward the same. The writer has seen thousands of acres of land sold in San Bernardino county, with water on the same, for from three to seven hundred dollars per acre, and the same land not nearly as good as the made land I have mentioned, and in a climate which will mature all semitropical fruits as perfect as in any county in Southern California. With such a system for the foothill lands of Butte, Yuba, Placer, Nevada, El Dorado, and Sacramento counties, one could hardly imagine the immense value it would make of them. One could hardly imagine the possibilities to make homes for millions of people.

There is room enough to deposit the debris of the mines to work them for 100 years. Of course we could not pipe the debris into the rivers at flood time. Whether this plan is original or not, I do not know; I have never heard it advanced. I have given it a great deal of thought. We cannot retain the debris in the river channels by dams; there is not room enough. We cannot flow them into the tule lands for the want of grade to carry them there. We cannot pipe them under pressure, for the sand and debris would wear out the iron in the pipes too quick. In my mind, there is no other plan to work the mines and not destroy the valleys and the rivers. The writer has seen, in Butte county, wheat grown on debris land flowed in from the Cherokee mines that yielded 50 bushels to the acre. As an evidence of the value of debris land for fruit, let them see the orchards now coming into bearing just below Oroville on the Feather river. The soil is one-half stone or gravel, which grows the sweetest oranges.

Hoping I have given a new thought, and that the result of the labors of the convention may develop some plan by which the vast treasures can be taken from the hills, and so doing not disturb any other interest in our State, I am very respectfully,

F. A. HILL.

The Brea Mines.

The *Herald* has alluded to the recent discovery of a large deposit of petroleum products near the city's west limits. It is called a discovery, which it is in fact, although the surface indications have been known for more than a century. The company owning the lands has been busy doing developing work the past week, with most gratifying results. A shaft was sunk on the hill, which gave a surprise in the shape of a ledge of bituminous rock, fully equal to the best from San Luis Obispo.

On the face of the bluff a cut about fifty feet was made. Every stroke of the pick has been in brea. Saturday another fine vein of asphalt was uncovered. On Saturday afternoon a big blast was fired, which loosened a good many tons of the hill. The debris was all brea—black and brown.

The asphalt vein was enlarged, and a small stream of oil commenced to flow out of the face of the bluff. This week the com-

pany will put their cheap fuel on the market. Those who wish to see one of the curiosities of Los Angeles, and at the same time witness an energetic development of its natural resources, should not fail to take a trip to the brea mine. It is just a quarter of a mile west of Westlake Park, and is reached by either the cable or electric cars.—Los Angeles Herald.

Smelting and Refining.

The great works of the Consolidated Kansas City Smelting and Refining Company at Kansas City, says the *Deadwood Pioneer*, which are among the largest works of the kind in the world, have experienced a year of healthy activity and of general prosperity. The output of this immense institution for the past 12 months is about 15 per cent larger than during the previous year, being approximately 25,000 ounces of gold, 8,780,000 ounces of silver and about 50,000,000 pounds of lead. In the handling of this vast business, there has been a contribution to the resources of Uncle Sam on account of tax on lead ores of about \$350,000 or over \$400,000 since the McKinley bill took effect. On the whole, the year has been quite satisfactory, this enormous tax paid being offset by increased margins on dry ores of the United States, and while profits are not up to expectations, yet business is being adjusted to the changed conditions.

The works of the Consolidated Smelting and Refining Works, built about ten years ago, are among the largest, if not the largest in the world. The smelting grounds contain 18 acres. Six acres, or one-third of this tract, is covered with buildings. Every day, when working under favorable conditions, it handles about 40 carloads of material, including fuel, flux, ore and other articles. The works have a capacity for handling about 23,000 tons per annum. The total refining capacity reaches the enormous amount of 50,000 tons of lead and 20,000,000 ounces of silver. The silver contains a quantity of gold. These ingredients have not been separated heretofore, being sent to the Government Mint for treatment; but the company has built a large separating plant to separate gold from silver, and now produces fine gold, fine silver, refined lead, and in 60 days will have a copper plant completed.

The copper plant which is now being built covers an area of 100x150 feet, and has cost to date over \$100,000. It will have a capacity of 400 tons of fine copper monthly.

Since the smelting works were built their operation has been attended with great success, the extensive business transacted by the company and the regular employment furnished mechanics and laborers at high wages, has established one of the greatest industries in the country. They are located at the natural meeting point of all the ores and smelting materials from British America to the City of Mexico.

There are five general departments of work in the six acres of buildings comprising the smelter. They are the assaying, sampling, roasting, smelting and refining. In each one of these there are numerous different processes to which the ore is subjected while being treated. In the assaying department, the value and component parts of the various ores are treated and determined. On the sampling floor the ores are mixed in the proper proportion for successful smelting. From the sampling department the ore goes to the blasting furnaces; there, with a mixture of charcoal, crushed stone, old tin cans and other smelting and fluxing ingredients, it is shoveled into the furnaces, and bullion is seen pouring out at one point into receptacles and the slag or refuse matter at another. The slag is received into bowl-shaped barrows two feet in diameter and a foot and a half deep, and taken to the slag-yard. Some valuable material remains in this. It settles to the bottom while cooling, and the part that is only fit for the ballast remains on top. The valuable portion is easily removed from the worthless portion of the cake of slag by a slight blow from a hammer. This is treated over again, while the slag is sold to the railway companies for ballast. The bullion which comes from the blast furnace contains silver, gold, lead, zinc and a few minor ingredients. This is received in molds, and when cooled each moldful is called a pig. Each pig weighs 75 pounds and is worth about \$15. The bullion is taken to the refractory department, where it is subjected to several processes which separate the gold and silver from the lead. The pigs of lead are loaded into cars at the smelter and shipped by express. This smelter produces one-fifth of all the silver and lead smelted in the United States.

Bezoar Stones.

[The following paper was read at the last meeting of the Microscopical Society by Henry G. Hanks of this city.]

Some time ago (the exact date I do not recall), Col. C. Mason Kinne of this society exhibited a concretion, labeled "Kidney Deposit From a Cow." The accompanying label bore the name of Dr. Charles W. Schoenemann of Mokelumne Hill. This curious concretion showed a metallic lustre resembling gold, which caused some discussion. It was placed in my hands for examination.

After convincing myself by a microscopical examination that the lustre was not due to the presence of any metal, much less gold, I laid it aside for further study, and for a time it passed from my mind, but lately it again attracted my attention and I determined to make an analysis of it, but on referring to authorities I found that the chemical nature of animal calculi had been so thoroughly studied that no investigation of mine would be likely to reveal anything new or different from the many analyses to be found in text books; but the research interested me and I made memoranda that I have thought might be of interest to the society.

As far back as the time of Pliny, *bilaris calculi* were used as a medicine, for that author, book 28, chapter 60, so states: "There are found in liver of the wild boar certain small stones of a white hue and resembling those found in the liver of the common swine. If these stones are pounded and taken in wine they will expel calculi, it is said."

From that time to the beginning of the present century, we read of the same use being made of them. They were known in mediæval times as "Bezoar Stones."

In the latter part of the sixteenth century, Caspari Bauhini wrote a treatise on the Bezoar stone, which was published in Latin in 1613, entitled "De Lapidis Bezoar," a copy of which I have brought this evening for your inspection. This work is not only a monograph, but the only one I find referred to by authors I have consulted.

Anselmus Boetius de Boot, 1647, and Robert Lovell, 1661, have written on this subject, but seem to have drawn freely on Bauhini. Both refer to him as authority.

Lovell states so many cures effected by the Bezoar stone that it is not surprising it was considered a panacea "against all sorts of poisons," etc., "and other malignant diseases." It is described by him as having a bad smell, being without taste, by some considered temperate, by others cold and dry; others say it works by its whole substance or occult quality.

As a medicine, it was given with "borage water," or sugar of roses; the dose was from one grain to one drachm, taken in mugwort water; conserve of maiden's hair; water of white lilies; unicorn's horn; red coral; sorrell water; brook lime water, or juice of lemons. To it was ascribed great medicinal virtues and it commanded very high prices.

Similar concretions are found in the biliary organs. It was not only the intestinal calculi that were considered as Bezoars, for Bauhini includes the "Paxar from the toad, the asp, and from the gall of the porcupine."

The Bezoar stone is described by writers as being "a hard, heavy stone, very variable and uncertain in shape, color, and in size between a horse bean and a small walnut," although there were some larger and smaller. The usual color was of a dusky olive or greenish brown, polished externally, and when broken, found to have the structure of concentric coats or shells, sometimes founded on foreign bodies, with a small stick or seed as a nucleus.

The Bezoars were then supposed to be, as now known, concretions found in the stomach, intestines, or liver of certain animals, those of Persia, presumably from the deer. The principal localities were Persia, Peru and New Spain (Mexico).

In an old volume, "A True and Impartial Journal of a voyage to the South Seas and Round the Globe in His Majesty's Ship, The Centurion, Under the Command of Commodore George Anson, London, 1745," we find a description of the bezoar stones of Peru:

"Of their wool are made very valuable mantles which never lose their color * * and in them," the vicunas and llamas, "the bezoar stones are found. Another sort of creatures, larger of body, called Tarugas, whose ears are soft and hanging down, do also breed the bezoar stones and of greater virtue." * * * "The bezoar stone is said to be found in all creatures in Peru, of which so many authors have treated that it will be sufficient to say it is found in the maw and sometimes in the stomach, sometimes only one, and sometimes two and

three together. There is much difference in the size and color, some bigger and some smaller, and the largest as large as oranges, some round, some oval, and in other shapes, as to color they are gray, black, white and gold color, but neither the color nor the size signifies anything as to the virtues. The Indians say there are abundance of venomous herbs and creatures which poison the water they drink and the pasture they feed on, and even where they tread, and that the vicuna naturally knows an herb (as do the other animals that breed the bezoar) which they eat to preserve themselves against the poison, and that the said herb breeds the stone, hence it has the virtue. This stone is good against infectious distempers, and if rightly applied, against the spotted fever and other diseases. The best bezoar stones are those of the East Indies, the next those of Peru, and the last those of New Spain. The Indians, finding the Spaniards value them, have made some artificial. There are also stones for the pleurisy for stopping blood and for the falling sickness."

Varieties of bezoar and names given to it: "Oriental," "Occidental," "Spanish Bezoar Stone," "Bezaar," "Belzaar," "Bezaar Stone," "Bezoar Microcosmum."

Besides the Oriental and Occidental, there were the mineral of Serapio, mineral of Cesalpinus, and that of "Hercules Saxonia," "The German Bezoar," "Lapiide Paxar," etc.

Bauhini gives the history as follows: The Oriental and Occidental were most prized; the former was from Persia and the latter from New Spain, Mexico or Peru.

The name is supposed to be of Persian origin, meaning expeller of poisons. It was considered an antidote for all poisons. Bezoards were composite medicines containing bezoar. It is now known that the bezoars have no medicinal properties.

The following description is by Lovell: "The oriental stone is of diverse figures, containing chaff or a hair, or the like. It is of diverse color (most commonly a blackish green), green, paleish ash, or yellowish, without smell, of diverse magnitude, but most commonly lesser than a walnut."

"Bezoar being so high priced, was often adulterated with fragments of stone and pitch or chalk, ashes of shells, and dry blood or cinnabar, antimony and quicksilver, united by the help of the fire, all of which are not only useless but hurtful to the body."

Concretions or calculi are found in many animals, and in different parts of the body. They differ according to the parts in which they are found, and to the food of the animal. In carnivorous animals they resemble those of man.

Chemists classify them into eight varieties:

1. Mainly phosphate of lime.
2. Mainly phosphate of magnesia.
3. Ammonia phosphate of magnesia.
4. Biliary.
5. Resinous.
6. Fungous.
7. Hair.
8. Ligniform.

There are numerous stories extant, legends of gold found in animals, which may have had their origin from the finding of concretions like that under consideration this evening.

Sometimes it is a fish, sometimes a bird or quadruped that becomes the treasury. As all, or nearly all, romances are founded on fact, so, as in this case, observers may have been deceived by the golden, almost metallic lustre and color of the concretions, for bezoars are frequently of a golden color as described by writers.

We find in Anson's Voyage, quoted above, that the Peruvian bezoars "were gray, black, white and GOLD COLORED."

We shall not have to go beyond the confines of California for stories of this nature. The following is an extract from the *Miner* of Alpine county, which I have on file:

"In the stomach of a cow killed at Silver mountain lately, was found gold dust of the value of over ten dollars, after panning out. The cow had run for the past two years on Wolf creek."

Another from the *Reno Gazette* of Sept., 1883, reads thus: "About an ounce of pure gold was found in the crop of a chicken killed the other day at San Diego. It was in small pieces mixed with sand and gravel."

The following, possibly a different version of the same, appeared in another paper in 1889: "In a chicken's gizzard last Thursday at Grass Valley, Matthew Mitchell of the Wisconsin Hotel found a pellet of gold worth twenty or twenty-five cents."

While the concretion exhibited this evening is certainly gold colored, and might be thought to be gold by a wholly ignorant person with a strong imagination, no California miner would for a moment be deceived.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

CLINTON CON.—*Ledger*, Dec. 23: This mine continues to wear a look of prosperity. Everything is kept humming, and the work of making additional improvements still goes on. In the sinking, some very high-grade ore has lately been encountered. A company's store has been built, and was opened this week; also a bar in connection therewith. The company this month paid the balance due on the McAtto property, amounting to \$7500.

PIONEER DISTRICT.—Mining in Pioneer district is decidedly on the improve. A. W. Kimball is working on his claim, with very encouraging prospects. He is down 100 feet, with a three-foot quartz vein. The ore is of unusually high grade, and shows considerable free gold to the naked eye. It is now estimated that the ore at the bottom will go as high as \$400 or \$500 per ton. W. C. Gracey is running a tunnel on the Sunny South claim. He is in a distance of between 400 and 500 feet, and has encountered the ledge, which he believes is the same struck by Garner and Emsley some years ago, which yielded \$60 per ton.

NEW YORK MINE.—W. G. Anderson, the superintendent, informs us that they have cleaned up three times at this mine, three miles southwest of Jackson. The yield each time was something over expenses. The large roller quartz mill does satisfactory work, and crushes between 20 and 30 tons per day. A force of seven men are employed at mine and mill. Mr. Anderson has just returned from San Francisco, whither he went to arrange if possible for the putting in of concentrators to save the sulphurets, of which the ore carries considerable, and they are estimated at \$50 per ton. He believes three Woodbury machines will be put in before long, which ought to place the property on a fair paying basis. It is reported that the Downs mine near Volcano is to be started up soon by a new company.

Butte.

A BIG LEDGE.—*Oroville Register*, Jan. 21: C. F. Belding informs us that the tunnel on the Shakespeare mine at Forbestown is now in 290 feet, and that the ledge is 23 feet wide. It is rich in sulphurets, and a hundred tons of ore will average about three tons of sulphurets. No work is being done at present in the Golden Queen. The Stow mill is now lighted with electricity, the dynamo being run by water power. It is thought the mine will be shortly lighted with incandescent lights from the same dynamo.

Calaveras.

RICH ROCK.—*Amador Ledger*, Jan. 23: J. O'Neil was in Jackson, Monday, showing samples of quartz taken from a claim operated by him at Whiskey Slide, Calaveras county. The rock was extracted from a depth of 90 feet, and shows plentifully of coarse gold. The ledge is narrow, not over 18 inches wide, but with a fair proportion like the sample shown us it would certainly yield a handsome profit. A test crushing was made at the Amador mill some time ago, which turned out well. O'Neil says it will average from \$8 to \$10 per ton. He has no facilities for crushing the ore.

A VALUABLE MINE.—*Mt. Echo*, Jan. 23: Prospecting is going on in the Excelsior mine, owned by J. B. Meyers, and situated in the western part of this town. Mr. Meyers showed us a large specimen of the ore, which shows free gold and carries sulphurets of a superior grade. All the mines adjoining the Excelsior, north, south, east and west, have proven valuable.

BUTTE.—These are stirring times in this section. New mills are being built, old ones renovated, new mines opened, and other improvements too numerous to mention. In fact, a spirit of enterprise seems to prevail throughout the entire community. Improvements continue at the Lane & Tulloch mine. The mine is looking first class and bids fair to be one of the largest and leading mines of the State. The mill on the Calaveras mine at Robinson's Ferry is running like clock-work. Work is going on actively in the mine also. The work of fitting up the Gold Hill mine at Smith's Flat is going on briskly. Men are employed at present grading off a foundation for the mill. Everything is running in splendid shape at the Gold Cliff mine. The mill is pounding away day and night, and the mine is making a satisfactory showing. Operations have been commenced in the Curtis mine at Smith's Flat. The Huntington centrifugal roller mill is in operation crushing ore.

Plumas.

INDIAN VALLEY.—*Plumas Bulletin*, Jan. 23: A ledge of fine ore 15 feet in width is reported to have been opened in the main tunnel of the Indian Valley mine.

NORTH FORK.—Alex. Cameron, Supt. of the Savercool mine, says the North Fork mines are all right—that considerable money will be taken out this year.

Inyo.

DARWIN DOINGS.—*Independent*, Jan. 22: At the Independence mine, a very important improvement has been completed by the introduction of water to the different parts of the mine. The mine is very dry in all its parts, and when miners were at work, the air quickly became so filled with dust as to make it very disagreeable and injurious to health. Mr. Reddy determined to remedy this by the introduction of water pipes to the various workings. This has been done, and now the men keep the ground all about them well sprinkled, and the air is free from dust, clear and pure. There is plenty of ore in sight, and teams are on the road all the time hauling to Keeler. There are

no idle miners at Darwin; if more men could be had, they would be employed at the Independence mine. The wages paid are \$3.50 a day. The Defiance mine, also owned by Mr. Reddy, is reported to be looking well with much ore in sight. At Lookout, Mr. Fitzgerald is reported to be accumulating a large amount of ore at the furnace, with intent to make a run soon.

Nevada.

GOOD ORE FROM THE HERMOSA.—*Grass Valley Telegraph*, Jan. 23: We were shown this morning some very fine ore from the shaft of the Hermosa mine. The quartz was literally filled with gold, and was of a moderately coarse nature. The ledge is from 10 to 12 inches in size, and appears to be now in a section of country where it can live. For a long time the ledge has been in and out, owing to the unsettled condition of the country; but it is now believed the ledge will remain permanently, and if such be the case, it will not be a great while before the Hermosa will be on a self-sustaining basis, and dividends will surely follow. It is the opinion of all miners, from the character of the quartz and the location of the mine, that it will be one of the best in the district. The ledge is said by those who know, to be identical in character with that from the Massachusetts Hill mine.

San Bernardino.

VICTOR.—*Times-Index*, Jan. 22: Victor is famous for its fine marble and granite quarries, which are now furnishing marble and granite for all the large cities in California. Gold and silver mines are being worked here at a large profit.

San Luis Obispo.

TO BORE FOR OIL.—*Arroyo Grande Herald*, Jan. 20: Mr. Sanford has leased certain portions of the Tar Spring Ranch to Mr. Meyer Lewis, representing a Los Angeles syndicate, which intends to commence boring for oil. The lease is for 20 years, and work is to commence within the next 60 days. One funny thing about the transaction—that is, funny to those who do not understand the scientific reasons therefor—is the fact that they did not want the level land at all, and chose the hilly promontories.

Sierra.

TELEGRAPH.—*Mt. Messenger*, Jan. 23: The prospects at the Telegraph mine continue good, the gravel looking well. In the gravel reached there is so much water that not much has yet been taken out.

MAPLE GROVE.—The contract of 25 feet has been finished in the Maple Grove tunnel, near Alleghany, and another contract, for that distance, has been let to the same party, S. J. Frazier, who, with Chris Honold, are doing good work. Hopes are entertained of striking pay gravel by May next.

Siskiyou.

ON THE KLAMATH.—*Yreka Journal*, Jan. 20: The several claims on the Klamath are still being worked, the river continuing at a low stage to permit successful operations, notwithstanding the great amount of snow on the mountains, the weather keeping just cool enough to stop it from melting until the spring season sets in.

CHINESE LUCK.—The Chinese Co., at the Bentz Bar claim, continue to realize rich pay, and may be able to work right along without pulling out, unless we have heavy rainstorms to raise the river to a high stage. This company realized about \$40,000 during 1890, and over \$100,000 during the past year, the cleanups from some of the cuts ranging from \$5000 to \$10,000 a day. Several of the company desiring to return to China last September, a division was made, the 18 members receiving \$4200 each. The gold from this claim is not as good as above, and no doubt comes from Dutch creek, as it brings only about \$15.75 an ounce, while the gold in the Kanaka and Swiss Bar claims, just above, sells at over \$17 an ounce. The Chinese sell the porous gold in this country for the most they can get, but take the solid gold to China, where they get \$20 in China money for it. The Phil Mott claim, farther down the river, is also paying handsomely, from which more gold has been taken out during the year than in any season since work was commenced in it. Work is also being carried on in several other claims along the river, and next season some of the claims lying idle last summer are to be reopened on a more extensive scale, with good prospects of success. The cold nights during the past few days have stopped the flow of water in the streams to prevent the miners from washing gravel and obtaining their usual supply of glittering ore, but the water supply will last just so much longer during the summer days by such retention.

NEVADA.

Washoe District.

CHOLLAR.—*Virginia Enterprise*, Jan. 23: The north drift from the incline station, 1500 level, is out 112 feet, face in hard porphyry. The joint west crosscut from south drift from Hale and Norcross incline, 1640 level, is out 95 feet, the last 20 feet in quartz containing bunches of \$50 ore.

WARD COMBINATION SHAFT.—The southwest drift, 1800 level, is out from the shaft 1000 feet; face in hard porphyry.

SIERRA NEVADA.—West crosscut No. 1 from the northwest drift, 630-foot level, 571 feet from the shaft, has been advanced 41 feet; total distance, 1666 feet; face hard in porphyry.

ALPHA.—The north drift from the winze, 550 level, is out 158 feet; face in quartz and porphyry. West crosscut, 70 feet south of winze, 550 level, is out 39 feet; face in quartz. The southwest drift from the Ward shaft, 1800 level, is out 1000 feet; face in porphyry.

EXCHQUER.—East crosscut, 150 feet south of north line, 600 level, is out 220 feet; face in porphyry.

SILVER HILL.—The south drift from the

Justice shaft, 490 level, is out 415 feet; face in gypsum and quartz.

NEW YORK.—Have been repairing the west drift from the shaft, 650 level. The west crosscut, No. 4, 650 level, is out 96 feet; face in porphyry.

POTOSI.—The raise from the south drift, 44 feet above the 1200 level, is up 26 feet; top in ore which assays \$35 per ton.

ANNES.—North drift from crosscut No. 4, on 420 level, was advanced 26 feet in quartz and porphyry. North drift from east crosscut No. 6 was extended 14 feet, continuing in quartz.

BULLION.—The east crosscut on north line, 1400 level, is out 110 feet; face in porphyry. The south drift from the Potosi winze station, 1500 level, is out 193 feet past our north line; face in porphyry. Have started in east crosscut 20 feet south of north line, 1500 level.

OCCIDENTAL.—The drift started north from west crosscut in south drift, on 350 level, has been extended 14 feet in fair-grade ore. The west crosscut from the north drift to connect with the winze on 450 level has intersected the winze level from the 450 level. The drift started from the Suro tunnel has been extended during the week 29 feet; total length, 245 feet.

UTAH.—The northeast drift from the main west drift, 725 level, started at a point 180 feet west from the shaft station, has been extended 49 feet; total length, 102 feet, continuing in porphyry and clay formation.

CONS. CAL. AND VIRGINIA.—There has been extracted from all parts of the mine during the week 1023 1910-2000 tons of ore, which was shipped to the Morgan mill. The average assay value of all the ore worked at that mill during the week (980 tons) was \$31.47 per ton. Bullion shipped to Carson Mint, assay value, \$15,582.28. At all points in the mine where we are extracting ore the ore has improved in quality, and this fact accounts for the increased value of the battery assays for the week.

Tuscarora District.

NAVAJO.—*Times Review*, Jan. 23: No. 1 south drift, 300-foot level, extended 10 feet. Intermediate drift below the 300-foot level extended 6 feet, showing a small vein of very rich ore. No change in the other workings.

BELLE ISLE.—No. 1 crosscut from No. 1 vein, 350-foot level, extended 15 feet. South intermediate from No. 1 winze extended 4 feet, rock very hard. A winze has been started on No. 3, 350-foot level, on rich ore.

DEL MONTE.—Second level—North raise from west drift is up 20 feet in porphyry. Upraise, east end of stopes, has been put 10 feet; ore 2 feet wide, assays \$54.

COMMONWEALTH.—Fourth level—Joint raise from south intermediate has been advanced 22 feet, good ore mixed through the vein.

NORTH COMMONWEALTH.—Hoisted 12 cars first-class ore; assays return \$390 to \$425 per ton, and 76 cars second-class; car sample assay, \$49 per ton.

NEVADA QUEEN.—Fourth level—West crosscut raise advanced 17 feet, no change. Joint raise from south intermediate advanced 22 feet, showing ore mixed through the vein matter.

Jefferson District.

GOOD ORE.—*Belmont Courier*, Jan. 22: Some of the mines that are being worked in Nye county are reported as looking well. Superintendent Oliver is finding good ore in the Salvador mine at Jefferson, and Harrison Bros. are also encountering rich ore in their mine in that district.

Grantville District.

AT WORK.—*Belmont Courier*, Jan. 22: Superintendent Mitchell is pushing the work of development with vigor in the Alexander and Brooklyn mines at Grantville, and silver ore is being hoisted to the surface.

Reveille District.

PROSPECTING.—*Belmont Courier*, Jan. 22: Prospecting is being prosecuted with energy in Reveille district and some rich ore is being sacked up.

ARIZONA.

C. O. D. MINE.—*Mohave Co. Miner*, Jan. 23: Fred Leonard, who has a lease on the 160-foot level of the C. O. D. mine, informs us that he has an 8-inch streak of good ore in sight. New hoisting machinery for the Arnold mine, Cedar district, is now on the way from San Francisco. Fourteen tons of ore is being packed out from the Berkley mine to Yucca for shipment to Kingman. The mine is showing up finely in the stopes. McMahon and Burke have a large quantity of ore stripped on the 60-foot level of the Prince George mine and will commence taking it down immediately. L. B. Austin has been appointed superintendent of the O. K. Mining Co. vice Mr. Long, resigned. The attachments against the property of the company have been released, and the mine and mill will be started up as soon as possible. Very flattering reports from all sections of Mohave county reach the ear in regard to mines and mining. Every one who knows the difference between chloride of assessment and chloride of gold are either already in the prospecting field or are preparing to go. The recent gold excitement in the Chimbueva mountains has given every one the gold fever, and many old prospectors in Kingman are getting ready and going to the scene of the excitement. This year seems to be the commencement of a mining boom never before experienced in the history of Arizona.

IDAHO.

ROCKY BAR.—*Elmore Bulletin*, Jan. 20: The past year was a rather quiet one with the old Rocky Bar district. Several of the good properties owned by Eastern companies lay idle most of the time, while others made no progress at all. The Elmore Co. did considerable

prospecting, and lately let a contract for sinking their shaft 200 feet farther. This work will go on the present winter, carrying the shaft down to 700 feet, after which there will be cross-cutting and the running of levels. The mill was run for a time on Elmore ore, since which it has been run to the extent of 20 stamps on Vishnu ore. The Vishnu is operated through the Elmore shaft, having been connected therewith. The Vishnu is reported to be doing well, and the mine as being in good condition.

PINE GROVE.—Some years ago Pine Grove started out with brilliant prospects, and for a time was quite lively. Unfortunately, inexperienced men and companies got control of the gold and silver lodes and not only made errors in mining, but, worst of all, put in machinery for the free-milling of gold ores, when that class of machinery and process was not what was required. This mistake of course resulted in failure, and the tying up of the properties in such a manner as to keep others out. This condition of affairs, far too common to new mining camps, has about had its run, and now the district has begun to revive.

LOWER CALIFORNIA.

LA FORTUNA.—*Lower Californian*, Jan. 23: Frank Osborne, the veteran prospector, arrived in town Saturday from Tanama and other points on the Peninsula north of Ensenada. When interviewed by a reporter, he said: "I went to Tanama, on October 6th, as foreman, to assist in getting ready the works of La Fortuna gold mine, timbering up the main shaft and erecting buildings, hoisting works, etc. Quite a large amount of ore, and of a high grade, has been taken out since and very easily reduced, owing to its soft nature. The mine has good hoisting and pumping works, etc. The mill is a new one, improved by patents secured by Col. Lane, and its rollers get through about 15 tons per day."

MONTANA.

RISEING SUN.—*Tuolumne Independent*, Jan. 23: The Sonora Consolidated, also known as the Rising Sun, near Cherokee, has been idle since water gave out last November. Work was commenced Monday pumping out the water, and ore will be taken out again shortly. The ore goes about \$15 per ton. There is a 10-stamp mill at the mine.

NEW MEXICO.

VIOLA.—*Silver City Enterprise*, Jan. 23: The Viola mine at Pyramid has started up. Only a small force is being employed just now, but it will be increased in the near future. A large amount of ore is on hand, and the mill is kept running steadily. James Woodward, the well known mining man, is getting machinery in shape on the Livingstone mine, in the Burro mountains. The mine is owned and controlled by Mr. O. Bailey and friends. In doing the assessment during December last year and the first of this year, a fine body of high grade gold ore was struck in the Pennsylvania mine at Carlisle. The Peerless mine, which a few years ago gave such flattering promise of becoming a big bonanza, has now passed into other hands. The assessment work was not done on it last year, and it has been relocated by M. W. Twomey, under the name of Lillian.

OREGON.

WILL SOON STRIKE PAY DIRT.—*Bedrock Democrat*, Jan. 22: The pumping out of the shafts at the Virtue mine is being successfully accomplished, and Supt. Oliver says that only a few days remain before the mine will be free of water and the ore veins in the different levels exposed to view. Great hopes are entertained that the richness and extent of ore are all that has been claimed, and if so, the company, of which Mr. Oliver is the manager, will set about the operation of the Virtue on an extensive scale.

UTAH.

ANCHOR.—*Park Record*, Jan. 23: Thursday midnight the Anchor concentrator closed down for the purpose of putting in the new 16,000-pound rock breaker and to generally overhaul and repair the entire works. When operations are again resumed, which will be in a week or ten days, the output of the concentrator will be largely increased. Its present daily capacity is from 120 to 135 tons of crude ore, but when it again starts up, it is expected that 150 to 175 tons will be easily handled, and that, too, with a force of seven less men than are at present required to do the work.

THE SILVER KING.—There was considerable talk on the streets this week to the effect that the bond held on the Silver King by David Keith and others would soon be taken up. The Record man got hold of the rumor and at once made a visit to John Farish and asked him in regard to the truth or falsity of the report. Mr. Farish said there was nothing in it whatever; that the report probably grew out of the fact that the time for taking up the bond had recently been extended. The extension asked, he said, was reasonable, as Mr. Keith and associates had expended considerable money and time in the development of the property.

THE WEST ONTARIO.—Active operations were begun again this week at the West Ontario and a force of men is now at work extending the old crosscut on the 400 level to the ledge. The work is being done under the supervision of W. J. Wilson.

A POINT OF INTEREST.—Considerable interest is being manifested at the present time over a large body of ground surrounding the Kerr group of claims, and as a consequence a couple of tunnels are being driven to locate the apex to a vein of rich ore known to exist beneath the hill.

Adopted by the Executive Committee Jan. 22d, 1897.

MECHANICAL PROGRESS.

Condition of the Iron Business.

The condition of the iron business is an excellent criterion whereby to draw conclusions in regard to the general business of the country. During the past year a large amount of iron of every description has been made and has found a ready market. But present indications are to the effect that iron will be in still greater demand during the current year, at fairly remunerative prices. Both makers and dealers concur in this prognostic, and unless all past experience fails, the general business of the country will share in prosperity with the iron interest.

Official figures show that the value of cutlery imported in 1890 was less than half the value of that imported during 1891, while the consumption, according to all indications, has increased. This may be regarded as an evidence of the healthy influence of protection to home industry, especially since such protection gives no indication of any advance in prices.

Some lines of small hardware, especially such as is used by builders, were slow of sale the past year, in consequence of restricted building operations, brought about by the general depression of business. Nails, which are not subject to foreign competition, have never been so low as at present. The margins of profit in this line have been very small, and, in some instances, have altogether disappeared. Wire nails are rapidly gaining in use, at a considerable advance over cut nails.

There is an increased demand for some classes of small hardware for export. The same may be said of some classes of machinery. Foreign orders for locomotives are still coming in. Two $7\frac{1}{2}$ -ton locomotives have been ordered from an Eastern house for South America. A cable order has been received by the same house, from London, for two dummy engines of 15 tons weight, to go to Paraguay for use on a suburban street railway.

Railway car wheels are just now receiving marked attention. The contracting chill wheel is rapidly taking the place of the ordinary cast wheel. The more nearly perfect cylindrical shape, which is possible with the chill wheel, forms an important factor in its growing favor, especially for passenger cars. The additional cost is so trifling, it is thought that most of the users of cast iron wheels will soon very generally order the chill wheel.

A NEW SAW FOR LUMBER.—Improved methods for cutting lumber appear to be attracting much attention just now. In our last issue attention was called to an entirely new device for cutting as a substitute for sawing. We here present something new in the way of sawing, which it is thought will compete successfully with the hand saw. The device, according to the *Lumber Trade Journal*, consists of an upright saw, something like the old mule saw, only that it is thin like a hand saw, and has direct steam attachment. At each end of the saw is a steam cylinder, each cylinder having but a single steam port. The upper piston head draws the saw and the lower piston up, and the lower piston draws the saw and the upper piston down, each piston *drawing* the saw, but neither *pushing* it. This causes the saw at all times to be rigid, so that a very thin saw can be used. Below the lower cylinder are a pair of heavy balance wheels, which give a steady and even motion to the saw. To these balance wheels are connected a pair of rods, the upper ends of which connect with a knuckle joint at the lower end of the saw. This throws the lower end of the saw out as it is going up, and against the log as it is coming down. The log carriage is operated by the same engine that runs the saw, and is under perfect control by the sawyer. The inventor says: "There is no doubt but it will be a desirable mill for certain purposes. However, I should prefer not to make too much of it until I have fully demonstrated its value in a practical way."

PRIVATE VS. GOVERNMENT CONTRACTORS.—It will be recollected that much feeling has of late been manifested in English military circles on account of the imperfect make of sword bayonets at the Government works. This feeling was started at the time of the unfortunate Soudan campaign, in consequence of the disastrous failure of the bayonets employed at that time. Because of that English journals are talking about a new industry which has recently been developed at Sheffield—namely, the manufacture of sword bayonets for the British Government. Three or four years ago, no private firm in England manufactured

sword bayonets. They either came from the Government factory at Enfield or else from abroad. Some idea of the severity of the tests imposed will be gathered when it is stated that from 50 to 100 gauges are required in the various processes, before the finished bayonet receives the official mark of the War Office.

AT THE UNION IRON WORKS.—The first rivet was recently driven in the line of battle ship Oregon at the Union Iron Works in this city. The Oregon will be a sister vessel to the Massachusetts and Indiana. Each is what is technically known as a sea-going coast line of battle ships, and each will be of 10,200 tons displacement, 348 feet in length between perpendiculars, with a mean draught of 24 feet. Their armaments consist of four 13-inch, eight 8-inch and four 6-inch breech-loading rifles, in addition to a second battery of 28 pieces, namely, 20 six-pound and 6 one pound rapid fire guns and two gatlings. Each vessel will also be fitted with six torpedo tubes. The armor will be very heavy—18 inches thick above and 4 1-2 below the water line. The turrets for the 13-inch guns will be protected by 17-inch armor plates. Among other vessels now in course of construction at the Union Iron Works is a steamer for the Pacific Mail Steamship Company. She will be 345 feet long, will have 50 feet beam, and her tonnage will be 3550. The keel of the new craft has been laid, and a portion of her side-framing erected. Her engines have already been constructed.

PUNCHING STEEL.—Mr. F. H. Lewis of the Engineers' Club of Philadelphia recently read before that organization a very interesting paper on the proper limit of thickness to steel which may be punched. The thicker the steel, the greater the damage caused by punching. Recent tests to determine this matter indicate that punching injures steel less than iron up to, say, three-quarters of an inch in thickness, at which point the two materials are about equal in this respect. Beyond this point, the value of steel after punching decreases quite rapidly as the thickness increases. In iron, the percentage seems to be much more constant. The character of the fracture after punching, is also materially affected by the thickness of the material. Mr. Lewis proposes to limit to one-half inch the thickness of material subjected to punching, except that in girders over 50 feet long it may be nine-sixteenths of an inch; in top chords and end posts, five-eighths of an inch, and in shoes, pedestals and headplates, three-quarters of an inch.

STEEL-MAKING IN CHINA.—A large steel-producing plant for the Celestial Empire is at the present moment on its way to China, after being constructed by an English company at Middlesbrough. It forms a complete Bessemer plant, and the entire machinery for a large rail mill, as well as for plate and bar iron. Twenty puddling furnaces are also contained in the plant and two large blast furnaces, capable of producing 100 tons of pig iron per day. China is fast placing herself in a condition of independence of all "outside barbarians" for material for use both in peace and war. At the rate of improvements in progress in that country, China will soon become one of the most powerful nations on the globe. The senseless opposition of the common people to outside improvements is fast giving way to the inevitable. The governing classes have long seen and recognized the advantage and importance of putting their country in the van of universal progress.

THE USE OF OLD RAILS IN INDIA.—It has been quite a study of late to find a profitable use for old iron rails, which are rapidly being thrown aside, in consequence of their dangerous wear, or while their place is being supplied by steel rails. Railway engineers in India have found an entirely new use for such rails, by utilizing them for telegraph poles. For that purpose they have been found to be very effective and both cheap and durable. An extra piece of rail is held to the lower extremity of the full length rail in order to counteract its top weight. This end, of course, is buried in the ground. The brackets for these posts are of wrought angle iron. They are said to present a very neat appearance, and keep the wires well in place and apart—even during the heaviest winds.

A NEW BEARING MATERIAL.—German engineers are said to be adopting a new lining for bearings, composed of compressed vegetable parchment. When lubricated with an emulsion of mineral oil and water, the parchment becomes impregnated with the oil and will last for a considerable time.

SCIENTIFIC PROGRESS.

Electricity in Relation to Science.

Speaking at the annual dinner of the British Institution of Electrical Engineers on Nov. 13th, the president, Prof. William Crookes, said that they had happily outgrown the preposterous notion that research in any department of science was mere waste of time. It was now generally admitted that pure science, irrespective of practical applications, benefited both the investigator himself and greatly enriched the community. They knew little as yet concerning the mighty agency of electricity. Substantialists told him it was a kind of matter. Others viewed it not as matter, but as a form of energy. Others, again, rejected both those views. High authorities could not even yet agree whether we had one electricity or two opposite electricities. The light which the study of electricity threw upon a variety of chemical phenomena could not be overlooked. The facts of electrolysis were by no means either completely detected or coordinated. They pointed to the great probability that electricity was atomic, that an electrical atom was as definite a quantity as a chemical atom. It had been computed that in a single cubic foot of the ether which filled all space there were locked up 10,000 foot tons of energy which had hitherto escaped notice. To unlock this boundless store and subdue it to the service of man was a task which awaited the electrician of the future.

The latest researches gave well-founded hopes that this vast storehouse of power was not hopelessly inaccessible. Up to the present time they had been acquainted with only a very narrow range of ethereal vibrations; but the researches of Lodge in England and Hertz in Germany gave an almost infinite range of ethereal vibrations or electrical rays from wave lengths of thousands of miles down to a few feet.

Here was unfolded a new and astonishing universe—one which it was hard to conceive should be powerless to transmit and impart intelligence. Experimentalists were reducing the wave lengths of the electrical rays. With every diminution in size of the apparatus the wave lengths got shorter, and could they construct Leyden jars of molecular dimensions, the rays might fall within the narrow limits of visibility. They did not yet know how the molecule could be got to act as a Leyden jar, yet it was not improbable that the discontinuous phosphorescent light emitted from certain of the rare earths, when excited by a high-tension current in a high vacuum, was really an artificial production of electrical rays, sufficiently short to affect the organs of sight. If such a light could be produced more easily and more regularly, it would be far more economical than light from a flame or from the arc.

By means of currents alternating with very high frequency, Professor Nikola Tesla had succeeded in passing, by induction through the glass of a lamp, energy sufficient to keep a filament in a state of incandescence without the use of connecting wires. He had even lighted a room by producing in it such a condition that an illuminating appliance might be placed anywhere and lighted without being electrically connected with anything. He suspended two sheets of metal, each connected with one of the terminals of the coil. If an exhausted tube was carried anywhere between these sheets, and placed anywhere, it remained always luminous. The extent to which this method of illumination might be practically available, experiment alone could decide.

From Tesla's researches, it appeared that a true flame could now be produced without chemical aid—a flame which yielded light and heat without the consumption of material and without any chemical process. To this end, they required improved methods for producing excessively frequent alternations and enormous potentials. Would they be able to attain these by tapping the ether? If so, they might view the prospective exhaustion of coal fields with indifference; they would at once solve the smoke question, and thus dissolve all possible coal rings. Electricity seemed destined to annex the whole field, not merely of optics, but probably also of thermotics.

Another tempting field for research, scarcely yet attacked by pioneers, awaited exploration. He alluded to the mutual action of electricity and life. No sound man of science endorsed the assertion that "electricity is life," nor could they even venture to speak of life as one of the varieties or manifestations of energy. Nevertheless electricity had an important influence upon vital phenomena, and was in turn set in action by the living being—animal or vegetable. In the study of such facts and

such relations, the scientific electrician had before him an almost infinite field of inquiry. The slower vibrations to which he had referred revealed the bewildering possibility of telegraphy without wires, posts, cables, or any of our present costly appliances.

Is the Sun a Magnet?

About 70 years ago, Oersted of Copenhagen found that when a galvanic battery was passed along a wire parallel to a magnetic needle, the latter tended to deflect so as to form right angles with the direction of the wire. This discovery formed the foundation of the art of telegraphy, and also the ground for a tenable theory in regard to the earth's magnetism. It was agreed that the solar rays falling upon the earth carry with them electric force which passes around the earth's surface in a direction parallel with the equator, and as our planet turns on its axis daily, that this is the force which causes the magnetic needle to point approximately north and south.

This idea has not been materially improved upon in the last half century, though in the course of that time several persons have laid claim to the discovery that the sun is a huge magnet, and found fault with the world for not hailing them as benefactors of the race. Scientific observations of the sun have, however, furnished a great deal of material for sustaining the theory, and explaining some of the phenomena of changes otherwise inexplicable. It has been found that unusual disturbances on the solar surface, whether in the shape of big black spots which are depressions, or eruptive prominences, are followed by deflections of the needle, making what are known as magnetic storms, and that there is at least some connection between them and displays of the aurora borealis.

Some two years ago, Professor Bigelow of Washington undertook a series of investigations into the directions of the lines of force in the solar corona, that brilliant entourage of the sun which is witnessed only during a total solar eclipse. The results of his measurements and mathematical analysis, tend to prove that the lines referred to are identical in direction with those in the field of a terrestrial magnet, the rotation of the earth corresponding to the movement in the electricity-inducing dynamo. The parallel is also found to account closely for the well known daily oscillation of the needle in the absence of magnetic storms, the effect varying at any particular spot on the surface as it approaches the sun during the morning hours, and then recedes from him in the afternoon. If the earth were stationary, the radiant force would be felt immediately, but owing to its rotation there is a lag of about 23 degrees of an arc or an hour and a half of time. On this point observation and the mathematics agree, and it is found that along the resulting curve in the lines of solar force, the light and heat pass outward from the sun while the magnetic force is directed inward.

An important theoretic deduction from these comparisons is that the sun acts magnetically upon the earth through the medium of interstellar ether, the earth reacts upon the moon in a similar manner, and by this will probably be explained certain movements of the lunar nodes which are not satisfactorily accounted for by the theory of gravitation, as well as part of the perihelion motion in the orbit of the planet Mercury. Still another curious point has been brought out, and this settled instead of being simply raised for solution. It is the rate of rotation of the sun near his poles, which has long been known to be slower than near the equator. The coronal pole being found to be about $4\frac{1}{2}$ degrees away from the poles of rotation, it has been found that the former rotates once in 27 days, 9 hours, 52 minutes and 52 seconds.

The results of this study are accepted as valuable by several leading astronomers in this country. An effort will be made to extend the observations, and in particular to examine the relations between magnetism and the weather, for which purpose improved magnetic charts will be supplied to navigators, and arrangements made for systematic observations at land observatories. If the theory be substantiated, it may result in a wide extension of human knowledge of the relations of worlds to each other, and in a better understanding of "the Newtonian Potential Function in the case of repulsion."—Exchange.

ELECTRICITY AND THE TIDES.—A Canadian electrician claims that electricity causes the tides, and demonstrates it by electrifying a rubber comb by rubbing it through the hair, and then drawing it over the top of a glass filled with water, the result being that a tidal wave follows the comb.

GOOD HEALTH.

The Keeley Cure for Dipsomania.

A Pacific Coast Branch Established at Los Gatos.

THE MINING AND SCIENTIFIC PRESS, if we are not mistaken, was the first journal in California to call attention to the great value of the "Keeley Cure" for dipsomania, which is now attracting much attention in all parts of the country. Yet, notwithstanding the cumulative evidence of its value, it is still regarded as of little importance by many. The medical profession especially seem to place but little confidence in it. One of their writers, speaking of Dr. Keeley's and other specifics for alcoholism, says: "All this notoriety about specifics is the veriest trash, and will soon pass away as one of the day's wonders." But the people at large, and most of the secular press, are disposed to regard it as a great boon to humanity, although many sad failures are from time to time reported. So far as can be learned, from 85 to 90 per cent of all who take the treatment receive perfect and permanent benefit. The doctor claims that 95 per cent are cured. It is an unfortunate circumstance in the history of medical practice that no treatment of disease is successful in all cases.

THE MATTER AND METHOD OF TREATMENT

Is as follows: The patient is first provided with a bottle of his favorite liquor and told to partake of it freely, and when satiety provokes disgust the doctor commences his regular treatment, which consists first in giving a hypodermic injection of a preparation, the name or nature of which has not yet been given to the public, but which the doctor explains to his patients is intended for a "bracer" and which he says also regulates the effects of the chloride of gold which is taken internally. The mode of preparing this last is also unknown to the world, as it is not a simple chloride of gold, but compounded with other ingredients. The patient after receiving his hypodermic injection is given a bottle of the chloride, which he is instructed to take once every two hours during the day, at his room or wherever he may be. He is also instructed to visit the doctor's office four times a day to receive a hypodermic injection. When this service is performed the patients are required to form in single column with bared arms and pass before the doctor or one of his assistants for treatment. The amount of the injection varies with the condition of the patient, as shown by the tongue and pulse. The primary object is to increase the temperature of the body by accelerating the pulse. The effect is instantaneous. The general effect of the treatment is an almost total obliteration of the appetite, a quieting of brain action—in short, giving the entire system a complete rest, or rather state of lassitude. A dislike for any kind of alcoholic drink is also set up within three or four days.

TREATMENTS FOR OTHER DISEASES AND HABITS.

Dr. Keeley also treats patients for the opium and morphine habit; for the excessive use of tobacco, especially cigarette smoking; also for neurasthenia, a peculiar nervous weakness. Each of these habits receive the same general treatment as for dipsomania, but with menstrooms somewhat modified and carrying different chemicals, suited to each particular case.

THE USE OF A SOLUTION OF GOLD

For the treatment of disease is nothing new. It was in vogue some five centuries ago, and known as *aurum potable*, and was chiefly employed as a tonic and was by many regarded as a restorer of youth—an elixir of life. It is also used at the present day, but Dr. Keeley seems to have been the first to employ it as a specific for drunkenness.

IT IS A SECRET REMEDY,

And it is chiefly for that reason that the medical faculty, as already stated, takes but little interest in the matter. It is held by the profession as a fundamental principle that they shall not take any notice of, or hold any communication with, any person who employs any secret remedy. This practice may have some reason in it; but the evidence is cumulative that it costs the world many thousands of lives every year, a hundred times as many as are saved by adhering to it. It is, moreover, well known that many really valuable medical remedies have been brought to light by persons not enrolled as members of the profession in any of its branches, and who totally ignore all medical rules. Many maladies once thought incurable by the faculty are cured to-day by remedies not first introduced by professionals.

The rule may have a small value; but hu-

manity would be immensely benefited by its total abrogation. Science marches triumphantly over many of the ancient landmarks of professional ignorance and prejudice, and good common sense often wins victories over maladies which our professionals of to-day pronounce incurable. It would be far more humane to seek for and utilize truth, wherever found, than to build barricades around it and compel it to come in through prescribed gates or stay out altogether. In this respect, the medical faculty is far behind the age, and is daily losing the good will and respect of progressive men and women. Does Keeley cure? That he does cure fully 85 per cent of those who come to him goes without saying; but there are those who derive but little or no benefit from his practice. In fact, there are

THREE KINDS OF CASES WHICH KEELEY CANNOT CURE,

And which have been stated as follows: "There is the wealthy class who go to him and think they are cured, and then they find themselves out of business. They have no intellectual pursuits and no longer see the enjoyments of the race course or the club, so that in some instances they have resumed the old habits. Another class is composed of those afflicted with a species of insanity. They are usually intellectually brilliant, or have been, but there is scarcely enough brain force left to build upon in an effort to change their mode of life. A third class is the thoughtless young man or boy, who usually belongs to the wealthy class, and is there, as he says, to 'please the old man.' These look upon it as a vacation, and go away from Dwight in some instances only to return. 'I'm here again, doctor,' remarked one on his second visit. 'The boys said I could not drink, and I thought I would show them I could.' But the doctor told him to go home again; that he could not and would not waste his time on such patients."

A KEELEY INSTITUTE FOR CALIFORNIA.

So great has become the popularity of this cure that Dr. Keeley has begun to establish Institutes in various sections of the country for local convenience. One of these has recently been established at Los Gatos; a beautiful and healthy location six or eight miles west of San Jose, in the foothills of the inner coast range of mountains. We understand that another will soon be established in this city, where "it is useless to remark," it is greatly needed. A large number of patients is already under successful treatment at Los Gatos. The first graduate left the institution, fully entitled to graduation honors, on the 15th inst. It is stated that much joy was manifested on the occasion. The gentleman's wife and two little children went to Los Gatos, and were rejoiced to bear the patient home in triumph, "clothed and in his right mind."

We trust that such may be the result with thousands—in fact all who may be in need of such a course of treatment.

CLIMATOLOGY OF OLD AGE.—The climatology of old age may be roughly summed up as follows: Elderly people in general do well with equability and moderate warmth; they bear cold badly; they benefit by abundant sunshine. The high altitudes are very rarely suitable to them, and are usually decidedly injurious; they do best in level places, where there is abundant shelter. They may or may not benefit by the seaside or a sea voyage, but these measures cannot be recommended with at all the same confidence as in the case of children. Most of these principles become almost obvious upon a little consideration. The failing vitality, by which we mean impaired vigor of circulation, assimilation and excretion, which characterizes advanced years, and the special maladies most frequent at that time of life, such as rheumatism, cardiac disease, gout and renal affections, serve to determine the climatological problem. Moderate warmth with fair equability, abundance of sunshine with adequate shelter, and level walks, evidently meet the most obvious indications called for by these affections.

A REMEDY FOR THE GRIP.—Dr. Keely, who has met with great success in curing dipsomania at his home in Dwight, Illinois, says: "I would like to suggest a treatment for the grip which I know is nearly a specific as well as innocent. It is simply asafetida, given in four-grain pills, one pill four times a day. No man need be sick of the grip these days who will take it. For the past two years, with all my patients here, subject, of course, to such an epidemic, I had not one man go to bed from the disease. I break it up very quickly, and, in fact, cure it. If this treatment was generally known, it would save sufferers much expense and wretchedness and many useful and valuable lives." In view of the fearful suffering, and

large and increasing death record from this prevailing disease, would it not be well for some of our physicians, who are daily being called upon to prescribe for this disease, to try Dr. Keeley's prescription and report the results in some of our city papers?

ELECTRICITY.

Telegraphing by Induction.

Mr. Edison's latest electrical invention is a system of telegraphing by induction, or without the use of continuous wires between the two points. To accomplish this purpose, he secures an elevation such as will overcome the earth's curvature between the two points between which he would telegraph. An elevation of about 100 feet will overcome that curvature, say for 30 miles, in every direction.

As we understand it, a wire is charged with electricity at that elevation and conducted to the ground, from whence, by induction alone, without connecting wires, signals may be sent in any direction and picked up at as many terminal points as may be desired within the circumference of the 30 miles radius. At such heights, it is claimed that the minimum of the earth's absorption is attained, and between these heights, across uninterrupted expanse, he believes he can electrically send messages.

"If this theory is sound, and it can be reduced to practice, he will have conferred upon mankind an inestimable blessing. Ships, becoming distressed at sea, can from their topmasts send signals of distress to any other ship within a radius of 30 miles, and if the latter cannot render assistance, they can send on the signals for another 30 miles, and so on, until relief can be afforded. So, too, upon land, where a perfectly uninterrupted and high level space between high points is attainable, electrical communication will be possible without the aid of intervening wires. The possibilities of good and of convenience in such a system are almost limitless."

A scheme something like this was put forth several years ago, whether by Edison or some other person we do not now recollect, whereby it was claimed that submarine cable communication could be obtained through long distances by simply extending a wire for a few miles from the shore, and then placing on the bottom of the ocean short lengths—a few miles—of wire in the direction desired, the last length reaching from the water to the receiving station. The theory was that an impulse started from either end would pass along to the end of the first wire, and thence by induction to the next and so to the objective point. It was seriously proposed to connect this city with the Sandwich Islands by such a broken system of wires.

Electric Railway Progress.

The electric railroad from Oakland to Haywards and beyond is fast reaching out to an accomplished fact. The rails at this end of the road are rapidly being laid. The portion of the road in and near the city is being laid with ordinary girder rails such as are generally used on street railroads; but beyond the city limits, T-rails will be laid, which are now being rolled at an Eastern rolling mill, and which are expected to arrive on this coast as soon as wanted—early in February. Other parts of the work—the building of the power house, machinery, cars, etc.—are being pushed rapidly forward. The Risdon Iron Works are building the engines and boilers; the cars are in process of construction by the Carter Bros. of Newark; the motors for the cars have been built by the Thompson-Houston Company and are already on the ground; the San Francisco Bridge Company has the contract for building all the bridges—the first over San Leandro creek has already been completed. It is expected that the road will be open for traffic some time in April next.

The Los Angeles Electric Railway, according to a recent statement of Maj. A. W. Bancroft, the superintendent, has already about 40 miles in operation, and expects soon to add 35 miles more. Mr. Bancroft pronounces the road an unqualified success. The company is building a plant of sufficient capacity to operate 200 miles of road in all. The present purpose is to extend it to Santa Monica, 20 miles from Los Angeles, on the sea coast. This is probably the most extensive electric railroad system, fully entered upon, in any part of the world.

San Diego is also constructing quite a comprehensive system of electric roads, which will, in all probability, be gradually developed into quite as large an undertaking

as that at Los Angeles. Nearly all the growing representative cities of the country are looking to electricity as the coming motive power for their street and suburban roads.

The success which has attended the inauguration of the St. Paul and Minneapolis road has encouraged the Illinois Central managers to think seriously of experimentation, and in fact has led well nigh to a firm conclusion to attempt to operate a portion of their Chicago intramural and suburban transportation business by electricity. A special committee has made a careful investigation and reported that the plan is perfectly feasible. If this road succeeds in this proposed experiment, it will not be long before the company will push the experiment still farther and onward, until we shall see the swift running trains of the Illinois Central rushing over the country for hundreds of miles, or wherever steam can go, propelled by the "coming power."

ELECTRICITY FOR A GREAT FLOUR MILL.—The great success which has attended the application of electricity to the railroad between St. Paul and Minneapolis has encouraged some of the capitalists of the former city to solve the problem of manufacturing flour by the aid of "harnessed lightning." To accomplish this, the water power of St. Anthony Falls will be utilized and brought to St. Paul. If this experiment should prove successful, other mills in the twin cities will "follow suit," and quite a thorough revolution will be effected in the operations of those great power using cities. It is claimed that the steady power to be derived from the dynamo is far preferable to that derived from either water power or steam directly applied to flour mill machinery. Mr. Kingsland Smith, an experienced and practical flour manufacturer, the inventor of the roller process, which has wrought a complete revolution in this business, has been experimenting quite carefully in a practical way, for the past year, on electrically driven flour mill machinery, and has fully arrived at the above conclusion. Thus it is that history is making record from day to day of the successful introduction of new machinery and new methods by which the great field of human industry is being more successfully and more profitably worked.

ELECTRICITY IN IRON SMELTING.—Electricity has been for some time employed in the smelting furnace; but it is only until quite recently that this agent has been successfully employed for reducing pig iron into a good quality of wrought iron. This, it is claimed, has been done by Dr. Stephen H. Emmens of Emmensville, Pa. The process is simply an elaboration and adaptation of existing methods of electrical deposition, and by this means Dr. Emmens claims to be able to produce from any grade of pig iron a ductile malleable iron of almost chemical purity, which only needs washing, heating and rolling to make it equal to the best quality of Swedish iron. The inventor claims that he can produce wrought iron by this method at a lower cost than the ordinary process of puddling, and still further economy results from the use of low grades of pig iron made from ores that are too impure to be used by the existing process of conversion.

ELECTRICITY ON THE ERIE CANAL.—Electricity for transportation purposes is fast working its way into general use. There is now a movement on foot in the State of New York for applying electricity as a motive power on the great Erie canal. The idea is fast becoming very popular. The trolley system is proposed, which is much the cheapest, and would no doubt be found much cheaper than either horse or steam. A trolley system could be constructed along each bank of the canal.

A NEW ELECTRIC GAS LIGHTER has been introduced in Boston, which is entirely different from any other gas lighter. By this device, the gas is lighted by the mere turning of the gas cock in the usual manner, without the intervention of any other piece of apparatus. The key of the gas cock is thus always a true index of whether the gas is turned on or off, and thus prevents any possibility of accident by leaving unwittingly the gas turned on during the night.

At present, of course, such schemes must be considered as only dreams of a possible future. While they now appear Utopian in the highest sense, no thinking, intelligent mind of the present day will venture to pronounce them impossible of realization at some future time, when we shall have fuller knowledge of the subtle agent, upon the mere fringe of whose possibilities the greatest electrician among us is now treading.

Passing Events.

The mining men of this State have had their attention this week almost entirely absorbed by the State Mining Convention. The results are such as to please them all and to bring about a condition of affairs which is a surprise to the general public as well as to many directly concerned. The committees, which will go to Washington to appear before Congress, are agreed upon a common demand, so that good results are sure to follow.

We have, very naturally, given a great deal of space to a record of the proceedings of the convention, and the account will be found full and accurate. Our mining friends who could not be present can, by reading what we have prepared, be fully informed of all details.

The mining question in California is coming up in Congress in several forms, and it is pretty certain that some definite action will be taken during the present session.

MINE SOLD.—A syndicate of Tacoma and Seattle capitalists, represented by James F. Wardner of Fairhaven and F. W. Dunne and L. W. Getchell of Seattle, has purchased the Black Bear and War Esle mines, in Okanogan county, Washington, for \$200,000. The mines have been operated for four months with a five-stamp mill in connection, and have yielded \$35,000 billion.

The Convention.

The proceedings of the State Mining Convention were harmonious beyond expectation. The much-dreaded Sacramento delegation proved to be one of broad-minded men, above the prejudices with which they were credited. The remarks of Messrs. McClatchy, Johnson and Devlin and of Berry were such as to reassure the mining men that the valley people could be their friends as soon as assured that the miners intended in good faith to do nothing beyond the law. This assurance given, and apparent from the resolutions and memorial, the valley delegates assented to the propositions brought forward.

The convention was in many respects the most important which ever assembled in this city. The questions with which it had to deal were of such a nature as had involved a bitter controversy extending over a period of many years. The property interests were valued into the millions of dollars. Yet so well was the whole affair managed that instead of any vindictive feeling and acrimonious debate, the proceedings were harmonious to a degree.

Such a result was hardly to have been expected from the nature of the events which had gone before. Mutual concessions and sober judgment on both sides brought it about. There was nothing really for either side in further controversy. This was the first time the factions had ever come together to try and reach a conclusion; it was, in fact, the first time they had ever had a common ground on which to work.

The basis on which the whole thing rested was the report of the U. S. Engineers, appointed by Congress to examine into the debris question in California. This report showed that it was possible to work the mines without material injury to other interests, under certain conditions therein set forth.

When the antidebris people came to realize that the miners were willing to base their demands entirely on the recommendations of that report; were willing to concede that they had done damage; were willing to refrain from further operations until Congress adopted and put in force the plans of its engineers; they, then, were willing to withdraw opposition to hydraulic mining and assist the miners in getting Congress to do something which would permit the mines to work without injury to other interests.

Here, then, was something that both sides could agree upon at last, and by confining itself strictly to consideration of the subject on this basis, without any outside issues of any kind whatever, the convention met, transacted its business and adjourned, with both sides satisfied with the results.

What happier consummation could have been reached? What wiser councils could have prevailed? The miner wants the gold; the farmer wants the gold; the State wants the gold; the nation wants the gold.

And the gold is there. It is there in those gravel hills in hundreds of millions of dollars. But the miner could not legally extract it since by reason of the physical condition of the country the debris resulting from his work injured the lands and rivers. For years the gold has been locked up, and time proved the want of it to all concerned. When at last through the action of the Legislature and of Congress unprejudiced and skilled engineers came between the two factions and pointed out a way by which the gold could be mined out and no harm result such as had been complained of in the past, there was a chance to remedy in a measure the evil which had been done.

But prejudice and ill feeling still existed. How then could this be dissipated and the two sides be brought to agree upon what had been recommended to them. To a humble miner in Placer county occurred the idea of bringing these men together. The movement grew and in the end resulted in the most largely-attended and important

convention which ever met in San Francisco. The proceedings are recorded elsewhere in this number of the PRESS. The results are far beyond expectations and will be wide-reaching and important, not only to California but to the Union.

There is one man who ought to be happier than all others at this result, though his name does not appear in the proceedings of the convention. That is Marion Biggs of Butte county, ex-member of Congress. He pledged himself while in Congress to do something for the miners. It was through him that the Commission of Engineers was appointed. He introduced the bill for the appropriation to inquire into the debris question and got it passed.

It is doubtful if even he could have predicted such a result from his bill, for to the existence of that Government Commission is due the good feeling prevailing among men who have been enemies for years. With this report between them they have joined hands, and will, in the future, instead of contending with each other, fight for a common cause.

The Mining and Scientific Press.

Like any other human industry, that of mining must have an advocate which will bring before the public such measures and events as affect the business and those engaged in it.

The MINING AND SCIENTIFIC PRESS is fighting, and proposes to continue to fight, the battles of the miners of California; and it will be obliged for their cooperation and assistance in extending its circulation by their subscriptions. The advantage will be mutual, since by adding to its influence and widening its field, it will be possible for the paper to accomplish more good for those whose interests it advocates, and itself meet with better recognition.

The MINING AND SCIENTIFIC PRESS was the first journal established in the United States specially devoted to the mining industry. It not only keeps close track of current mining news of the day in the way of development, strikes, new fields, etc., thus bringing properties to public attention, but publishes the best description and notes of improved methods and metallurgical processes, with engravings and new mechanical appliances connected with mining and milling. On matters relating to the mining laws it has always been a recognized authority, publishing, explaining and commenting on the decisions and rulings of courts and departments, so that the miner could learn the legal aspects of any case at once.

It is hoped that the miners of this State will show still further appreciation of the efforts of the MINING AND SCIENTIFIC PRESS and assist in a material way in extending its circulation.

The proceedings of the State Mining Convention will be found in full in this number. From them it is apparent that a revival of the mining industry of California is at hand. The MINING AND SCIENTIFIC PRESS has taken an active part in creating an interest in this movement, and the miners of the State should offer it their assistance in order that it may still further aid in the good work.

SAN FRANCISCO has never before seen such a gathering of representative miners as appeared here during convention week. They were well received and complimented on all sides for their appearance and the intelligence with which their business was conducted.

NOTWITHSTANDING the discussion about debris dams, continued during the past ten years, it seems, after all, that these dams are to be the salvation of both miner and farmer.

A FLOOD of water broke into the No. 9 tunnel of the Sierra Buttes mine, Sierra City, this week, doing some damage to the works at the mouth of the tunnel.

The California Miners' Association.

Officers and Committees of the State Organization.

The officers of the California Miners' Association are as follows:

DELEGATES TO WASHINGTON.

Hon. O. W. Cross.	Hon. J. K. Luttrell, Alternate.
Robert McMurray.	Frank McLaughlin, Alternate.
J. B. Hobson.	Wm. Ireland Jr., Alternate.

[It has been decided that Messrs. Luttrell, McMurray and Hobson will go to Washington to present the memorial and resolutions to Congress, and confer with the committees.—EN. PRESS.]

The headquarters of the California Miners' Association have been established at room 23, No. 33¹/₂ Pine St., S. F. Stock Exchange Building.

THE CONGRESSIONAL COMMITTEE.—The following gentlemen were nominated at the meeting of the Executive Committee of the California Miners' Association, and from the list the committee to go to Washington was selected: J. H. Neff, A. W. Cross, Maj. F. McLaughlin, Robt. McMurray, J. B. Hobson, C. G. Yale, J. H. Boalt, A. Walrath, A. B. Dibble, Grove L. Johnson, J. K. Luttrell, A. J. Bowie, M. H. Mead, J. Daggett, McMurray of Plumas. It has been decided that Messrs. J. K. Luttrell, Robt. McMurray and J. B. Hobson shall form the committee.

All that remains to be done now to rehabilitate a great industry is for the miner to keep absolute good faith; to abide by the declarations of the memorial and resolutions adopted, and to vigorously urge his demands, and the press and public will continue to express the kindly feeling already manifested, and assist him in every way.

THE editorials in the Sacramento Bee coincide exactly with the expressions of one of its editors before the mining convention. It has taken the ground that hydraulic mining should be permitted to go on again, provided this can be done in the manner indicated by the Government commission.

STATE MINERS' CONVENTION.

Proceedings of a Representative Body.

The Resolutions, Memorial, Speeches, Debates, Officers and Committees.

At 2 P. M. on Wednesday, Jan. 20th, the State Miners' Convention assembled in Pioneer Hall. J. H. Neff of Placer county, chairman of the Placer County Miners' Association, which issued the call for the State Convention, called the meeting to order and announced the first business to be the election of a temporary chairman.

Judge J. M. Walling of Nevada, in nominating Mr. Neff, said: "A short time since, a few gentlemen in the county of Placer met, and as a result of that meeting has grown this as an offspring. [Applause.] They seemed to have advanced ideas which have touched the sentiment of the people of this State, and it seems to us eminently proper that the gentleman whom they selected as their chairman should be temporary chairman of this convention."

Grove L. Johnson, of Sacramento, said: "As a resident of Sacramento county, interested in this question equally with that of any other county in the State, and perhaps more so, and feeling, as I believe the people of that county do, that everything should be done by this State to make the people of this State—farmers and miners—homogeneous and united [great applause], and recognizing in the gentleman nominated by Judge Walling a man known to the people far and wide as an honest, patriotic and worthy citizen, I take great pleasure in seconding his nomination, and hope that he will be elected unanimously and that our declarations will be as unanimous as our selection of temporary chairman."

Mr. Neff was unanimously chosen, and addressed the meeting as follows:

Gentlemen of the Convention: For this distinguished honor I return to you my sincere thanks. I shall endeavor as a temporary officer to so conduct the affairs of the Convention as to be considered impartial and fair, and particularly so to our friends who come here from a distance, representing districts that are not strictly mining counties. I admonish you, my friends, to be particular regarding the resolutions you shall formulate here. We cannot afford to antagonize the farming interests of this State. There are two great contending interests in California that we want to harmonize. We want to meet in a spirit of fraternity. We want to be together on this question. In unity there is strength, and we will be enabled to accomplish something through Congress.

This Convention was not called for the purpose of nullifying any law or overriding any decision of the courts, for we consider ourselves law-abiding citizens. To our neighbors in the valleys we will say that we don't propose to cover you up with slickens; not at all. We propose to proceed under the law, and if a plan can be formulated by the commission appointed by the General Government, we propose to proceed on that plan; but, gentlemen, that will be for you to determine. I consider it a distinguished honor to preside over such a body of representative citizens. I have never, in all my experience of 40 years in California, seen a better representative body of citizens than that which I now see before me.

On motion of D. T. Cole of Sierra, W. C. Ralston of San Francisco was elected Secretary, and on motion of J. B. Hobson of Placer Thos. B. Everett of Placer and E. A. Wilsee were chosen assistants.

After some discussion it was decided that the Chair appoint a committee of 15, from as many different counties, as the Committee on Credentials.

At this point V. S. McClatchy of Sacramento rose to a question of privilege; but C. W. Cross of San Francisco raised the point that a question of privilege was not in order until the convention was permanently organized. The Chair declared the point well taken.

M. H. Meade of Sierra suggested that the Chairman of each delegation prepare a list of his delegates.

The Chair suggested that a Committee on Memorial should be appointed, to frame a memorial to Congress setting forth the facts of the conflict between the two great leading industries of the State.

James H. Laurence of Merced moved the appointment of a committee of five. J. K. Luttrell of Sonoma wanted a committee of 25. He said:

"We want every section of this State represented if possible—the agricultural as well as the mining interests. A committee of five is too small for so important a proposition. I do not believe there is a gentleman here to-day but who is in favor of renewing hydraulic mining if we can do so without injuring the farming interests. Our desire is that every industry in the State should prosper. To-day we see thousands of empty houses in the mines, millions

of dollars invested and not paying a dollar; we see the farmers of the valley seeking a market for their products, and if mining were resumed they would find a market in the mines. Therefore let every section of the State have a voice in the memorial, that we may speak to Congress in tones of thunder and tell them what we want. If we do we will have legislation that will foster and protect every industry in our State."

After some further discussion, the motion to appoint 25 was carried unanimously.

Mr. C. W. Cross of S. F. said "Mr. McClatchy of Sacramento rose to a question of privilege and I raised a point of order. I did so that the proper steps toward permanent organization might be taken, and we might get down to work. These steps having been taken, I move that the convention give Mr. McClatchy leave to address the convention out of order." This motion was carried.

MR. MCCLATCHY'S SPEECH.

Mr. V. S. McClatchy of the Sacramento Bee was called to the platform and said:

Mr. President and Gentlemen of the Convention: This is an honor which I had hardly expected—to be called to the platform. I desire to say to this convention simply this, and it is something which yesterday I had no idea of saying. It occurred to me this morning that it ought to be said, from hearing various comments that had been made upon the appearance of the Sacramento delegates. I believe that the motives of these gentlemen in coming here were misunderstood. I, as one of the publishers of the Sacramento Bee, regarded as the most rabid anti-hydraulic in the State of California, can say with good grace to you, gentlemen, what I am about to say.

They have fought a good fight—the farmers and miners—because it was fought earnestly on both sides, but there is no good reason why good fighters should not be good fellows. That war is over. He is not a good patriot who continues a war after peace has been proclaimed. Both sides fought for what they deemed to be their rights—the valley man for the protection of his orchards, his goods and his home; you, gentlemen, believed you were right to conduct the business upon which you depended for a livelihood; which you believed to be right and proper.

This question between us has been submitted to the courts. The courts have decided on the broad principle that any man can use his own so long as he does not injure the property of others. Now, gentlemen, we find from the almost unanimous expression on the part of the gentlemen engaged in hydraulic mining—and I want to say here that the valley people never had any objection to any other kind of mining save hydraulic mining, and to that only in so far as it threatened to destroy their homes—that they will not oppose the laws of the State and nation, and that they will not oppose the decrees of the courts, and we came down to say to you that we want to bridge the chasm. [Applause.]

We recognize in the mining industry one that originally made the State [Applause]. My father was a pioneer; came here to California, walked up almost bare-footed, after being shipwrecked, 800 miles, from San Diego. He was one of the founders of this State, this commonwealth, and he recognized mining as one of its industries.

Now we of the valley oppose mining only so far as it threatens to destroy our homes. Now that has passed away and we believe you will not do anything to injure us, we say that we extend to you the right hand of fellowship. [Applause.]

The Sacramento delegation came down to assist in any way it can in solving this great problem of finding some means for allowing the prosecution of hydraulic mining which will not injure the rivers or our homes, and in any means that will accomplish that object we are with you. We will work with you, doing what we can to accomplish it. We know that the people of the State of California, ourselves included, are as much interested in the prosperity of a great industry like mining, as we are in the numerous other industries which we now foster. We want to foster mining, and we came here to say that there is only one California, the greatest country on God's footstool, and we want to stand together and foster every industry that will tend to develop its great resources. [Applause.]

Gentlemen, I thank you for your attention, and I want to assure you with all modesty that we people in the valley, we rabid anti-hydraulicers, are fairly decent fellows when you come to know us.

Mr. McClatchy's speech was received with great applause and furnished the keynote to the harmonious proceedings subsequently carried on. Judge Aaron Bell, of Shasta, said:

I wish to say on the part of the mining men of the State that we, too, will extend the hand of fellowship to Mr. McClatchy and to those who represent the same interest as he. The mining men have no fight against any interest that is for the peace and welfare of this State. We wish to build up all industries, and we, as I stated a few moments ago, desire to extend the hand of fellowship to our brothers in the valleys. I was exceedingly pleased to hear Mr. McClatchy give to this convention and the people of the State his views on this subject, and to state that he was with us; that he was willing to extend the hand to us. Therefore in return, we mining men of California can afford to extend the hand to them.

G. H. Wheaton, M. P. Jones and E. T. Allen, a committee from the San Francisco

Board of Trade, and A. J. Ralston, Robert Watt and G. W. McNear, a committee from the Chamber of Commerce, were announced and admitted to the convention.

FROM MEMBERS OF CONGRESS.

The following telegram from Senator Felton was read:

T. B. Everett, Secretary Placer County Miners' Association: In response to your request I have to say, that realizing the great value and importance of the mining industry of California, not only to those immediately interested, but to the State and country generally, and fully appreciating the unfortunate condition in which it is placed, I would earnestly favor any measure or means that justice could demand or grant to restore its prosperity, or such portions thereof as may be possible, without injury to other industries or interests.

C. N. FELTON.

The following letter, received by Judge Bell of Shasta from Congressman Geary, was read by the permission of the Judge:

I send you by mail to-day full copies of the mining bill, and will be thankful for any suggestions on the subject that will make the measure more effective and will tend to the relief of the mining industry. I think it is entitled to the greatest consideration on the part of the Government, and will do all I can to encourage it. I thank you for your telegram, and hope to merit a continuance of your good wishes and those of the people. T. GEARY.

A recess was here taken so that the Chairman could make up the committees:

THE WORKING COMMITTEES.

On reconvening at 4:45 P. M., the Chairman stated that Metropolitan Temple had been engaged for next day's session. The following committees were announced by the chair.

Resolutions—C. W. Cross, Chas. G. Yale, San Francisco; J. B. Hobson, Placer; G. J. Carpenter, El Dorado; J. M. Walling, Nevada; F. M. Swasey, Shasta; Grove L. Johnson, Sacramento.

Permanent Organization—T. L. Ford, Sierra; L. S. Barnes, Shasta; D. K. Perkins, Butte; Edward Coleman, Nevada; S. K. Thornton, San Francisco; H. K. McCusick, Alameda; E. C. Voorheis, Amador.

Credentials—J. S. McBride, Nevada; Robert Howe, Sonoma; F. R. Wehe, Sierra; Thomas Fraser, El Dorado; M. M. Drew, Sacramento; A. B. Paul, Shasta; James O'Brien, Yuba; T. J. Nichols, Placer; James Tunstead, Marin; A. Walrath, San Francisco; H. V. Reardon, Butte; H. G. Blaisdell, Alameda; C. McMahan, Tuolumne; E. W. Jones, Colusa; H. R. Givens, Trinity.

Memorial—Chas. G. Yale, San Francisco; J. K. Luttrell, Sonoma; R. C. Downs, Amador; H. A. McCraney, Lake; G. W. Cox, Sierra; Myron Angell, San Luis Obispo; Frank McLaughlin, Butte; Patrick Reddy, Inyo; J. P. Haynes, Humboldt; W. W. Kellogg, Plumas; J. S. Cone, Tehama; James Nelson, Yuba; W. D. English, Alameda; I. H. Reed, Calaveras; A. B. Dibble, Nevada; J. M. Fulweiler, Placer; John H. Shine, Tuolumne; John McMurray, Trinity; J. J. Crawford, El Dorado; J. H. Lawrence, Merced; N. Coombs, Napa; Aaron Bell, Shasta; F. H. Hall, Siskiyou; R. T. Develin, Sacramento; R. M. Folger, Mono.

MR. LUTTRELL'S REMARKS.

J. K. LUTTRELL, of Sonoma: I move you sir, that the committee on memorial be requested to report such amendments to the mining laws of the United States as will enable us to resume mining as of other days, and as will enable us to protect all interests mutually. I think the committee of 25, representing all sections, if anything can be done at all, can make such amendments as will meet the wishes of all concerned. I therefore move you that they be requested to report such amendments to the mining laws. Motion seconded.

R. T. DEVLIN, of Sacramento: Does that mean hydraulic mining alone?

J. K. LUTTRELL, of Sonoma: It means all kinds of mining. There is no use of our doing anything at all unless all interests and all parties are protected equally before the law. We are here for the purpose of doing something in order that the industries of our country may prosper. In traveling through the country last year I passed through a number of villages where there were beautiful homes and schools and churches, and not even a person inhabiting them, and not even a dog to bark at you as you passed through the streets. If anything can be done for the benefit of the mining interests, for God's sake let us do it. [Applause.] Let these places become populated and give employment to the thousands of men who are going through our country to-day seeking an honest living. As it is to-day our mines are given up almost exclusively to Chinamen, and when they take an ounce of gold out, where does it land? It lands in China. It does not benefit you or me. It is like taking a sponge and dipping it in a tub full of water. They take it up and squeeze the water out in China.

I want to see every industry of our State prosper. I came here among the first that came to the golden shores. I have been engaged in mining and farming, and can therefore take an impartial view of the matter. I do not desire to injure the farmers

in the least, but if the engineers can suggest any plan by which we can resume hydraulic mining, let us make the attempt. A few years ago you could see the roads leading through Yuba and Sutter, and all those agricultural counties, and hundreds of teams on them, farmers hauling their produce up to the mountains, where they could find a ready market for all they could produce and return laden with bullion and ore. To-day there is not a team going into those counties. The mountains are deserted, and there are millions of dollars invested in them.

This is the most important meeting that has ever been held in this State. Let us make the attempt to bring back that old condition of prosperity, and if we fail we have at least discharged our duties as American citizens. If we are successful, these deserted villages will be inhabited by a happy and prosperous people, and those thousands of houses will be filled up with bright and happy children, and there will be helping hands working in the mines and adding millions and millions of dollars to the commerce of gold.

I say let us make the attempt. If we can accomplish anything, let us do it. My young friend of Sacramento, whom I honor for his good father, Mr. McClatchy, extends to us the hand of good fellowship. We accept the right hand of fellowship, and if anything can be done, let us do it. If this committee of 25 can suggest anything, let them do it, and then let us approve it; and if they can make a suggestion and agree upon it, and this convention adopts it, I say to you within sixty days after the bill is presented in Congress, Mr. Harrison will approve the bill [applause], and prosperity will prevail all over our State. Therefore, I hope my motion will prevail.

MR. DEVLIN SPEAKS.

MR. DEVLIN, of Sacramento: I have no desire to take any exception to the remarks made by my distinguished friend, Mr. Luttrell. It is only as to the scope of his motion. There is no people who would more gladly see the hamlets and the villages of the mining regions of California filled with a happy and prosperous population, than the people of Sacramento. They would be glad to do anything that would secure that result, if it could be accomplished with no injury to them; but as I understood his motion, it was that an instruction be given to the committee on memorial to ask Congress to change the law in regard to the present state of affairs. If he means by that to pass laws by which engineering skill may aid them in determining their work, we of Sacramento will stand with him hand in hand. It is only to the language in which he expressed his motion that I desire to speak. As I understand this convention, and as I understand from personal conversation with the miners who are here, they recognize as fixed facts the decisions of the courts; they recognize the law has been declared and been determined, and as law-abiding citizens they desire to act within that law, and ask Congress to make appropriations to carry out the report of the engineering commission, whereby in proper places dams or other structures may be erected by which mining may be resumed without injury to the rivers or the lowlands below. If that be the object of this convention, and that is the object of the resolution, I have no objection, but the gentleman stated that it went further, and I will ask him, in order that there may be no misunderstanding—our people have, up to this time, acted in unison with you—that the scope of the resolution is not to change the decisions of the courts, but simply to secure appropriations for the purpose of enabling improvements to be made, in order that mining may be resumed without injury of the character complained of in the past, and it was simply as I said, because of the language of the resolution, that I asked the question.

MR. LUTTRELL: Mr. Chairman, in answer to the gentleman's remark, the motion was not to interfere with the decisions of the courts. It was simply to take such steps and, if possible, to make laws, and by means of civil engineering to construct dams and so forth, as will enable us to resume hydraulic mining, providing it does not destroy the interest of the farmer below. [Applause.]

MR. DEVLIN: I agree with the gentleman exactly; it is just what we want.

THE MINING LAWS.

MR. WALLING: I want to say just a few words, not for the purpose of discussion, but because it seems to me that the suggestion made by Mr. Luttrell is eminently proper. [Applause.]

You will all recollect that at the last session of Congress, Senator Stewart introduced bills looking to the amendment of the mining laws of the United States. Those

proposed laws and amendments were not acted upon. They will be again presented at the coming session. There are many things included in the present law that are crude and ill-digested, and in order to show the mining man how necessary it is for this question to be considered, let me say to you that under the rulings and decisions of the courts to-day you can not patent a mining claim unless you prove that you have gone under the ground, and that it has an actual present value for mineral. Everybody interested in mining must know, and we are not surprised that our friend from Sacramento has not studied the mining law, but every gentleman must know that he has got to prove that the ten acres ahead of him is as rich as the ten acres he is working, or else he can not get a patent to it, and that is the death blow to mining.

It seems to me that this committee, composed of so many competent gentlemen, can inquire into this question. If we are going to foster the mining industry, we want the mining laws of the United States to be such that they will give the miner a chance to obtain a patent to his land without first having worked his claim out to find out if it would pay. [Laughter and applause.]

LET THE GOVERNMENT TAKE CHARGE.

J. K. LUTTRELL, of Sonoma: We don't propose any amendment that is calculated to do any injury to any farm in the State of California. We do not want a mine if it is going to destroy the agricultural interests of our country, but if there is such a thing, and it is the desire of this convention that we should resume mining if we can do so without injury to the agricultural interests, for God's sake let us have the opportunity of testing it.

Let the Government take charge of it and take hold of the appropriation, and I hope this convention will not adjourn until this question is decided, because if we fail to recommend to Congress what we agree upon here, then our mission is worthless. We will have accomplished nothing. As soon as the miners here agree on legislation, all the time keeping in view the rights of all industries in our land, protecting the farmers as the miners are protected, and we can get such a proposition before Congress, we can pass the bill in 60 days, and I am confident the Government will build the dams, etc., at its expense, and if we can accomplish that purpose it will add millions of dollars to our country, and no one will be more benefited than the farmers in the valley; but if we are to resume mining at the expense of the agricultural interests, then I do not wish to resume mining. I do not want to resume mining at the expense of any industry in the land. I want all to have equal protection before the law. I don't want any gentleman to shirk the question, because I do not shirk it. I want you to say that the miner has equal rights that the farmer has, and we ask for no more than the farmer has.

If any of you desire to come before our committee and give your views, we will be thankful to receive them, and none will I be more glad to hear from than my young friend, Mr. Devlin of Sacramento, as I recognize him as one of the most promising young men in the State, and one whom I admire and have confidence in. I say to the farmers, "come forward and give me your views, and we will see if we can accomplish something."

The Second Day's Session.

At 10 A. M. on Thursday the convention was called to order in Metropolitan Hall, about 1500 people being present. The report of the Committee on Permanent Organization was first read. It recommended that the temporary officers of the convention be made permanent, and that 30 Vice-Presidents be selected, as follows:

Hon. J. M. Walling of Nevada, Hon. Wm. D. English of Alameda, August C. Busch of Sierra, A. J. Ralston of San Francisco, Robert Watt of San Francisco, Geo. W. McNear of San Francisco, Col. Frank McLaughlin of Butte, Hon. Edward Coleman of Nevada, Ex-Gov. H. G. Blaisdell of Alameda, Hon. Dan'l T. Cole of Sierra, Ex-Sen. James G. Fair of San Francisco, E. J. Baldwin of San Francisco, Campbell P. Berry of Sutter, Mayor W. D. Comstock of Sacramento, R. D. Stephens of Sacramento, Hon. J. K. Luttrell of Sonoma, Thos. Brown of San Francisco, Hon. Thos. J. Clunie of San Francisco, B. D. Murphy of Santa Clara, Hon. Chas. F. Reed of Placer, James Nelson of Yuba, Hon. E. C. Voorhies of Amador, Hon. Alf. Tregidgo of Nevada, Geo. H. Wheaton of San Francisco, M. P. Jones of San Francisco, E. T. Allen of San Francisco, L. G. Cole of Alameda, James L. Flood of San Francisco, Hon. Albert Gallatin of San Francisco, Hon. Thos. Fraser of El Dorado, Hon. Mark L. McDonald of San Francisco.

The report of this committee was adopted.

W. B. Thorpe of Placer stated that the supervisors of Placer county had made an appropriation of \$1000 for the benefit of the Miners' Convention now being held, to help along the results thereof. They also passed a resolution to attend this convention in a body. The chairman, a member of the Placer county delegation, stated that this appropriation "was not made to fight our neighbors in the valley, but as some of us are impecunious, they concluded to pay our expenses to this convention." [Applause.] On motion of Mr. Thorpe, the supervisors of Placer county were allowed seats on the floor as voting members of the convention.

Mr. Neff, in acknowledging the honor of being elected permanent chairman, said: "We have met here under favorable auspices. Since the meeting of this convention the hearts of the delegates have been gradually drawn together, and from present appearances, I think we will be able to adjourn and sing the refrain, 'Behold how good and pleasant for brethren to dwell together in unity.'"

THE RESOLUTIONS.

Mr. C. W. Cross, chairman of the committee on resolutions, then read the report of his committee, as follows:

WHEREAS, The experience of the world has demonstrated that gold and silver constitute the only safe, convenient and reliable basis of credit; and

WHEREAS, The output of gold is largely below the need of mankind; and

WHEREAS, There are in the gravel beds of California vast quantities of gold estimated at \$35,000,000, which can only be utilized by being mined by the hydraulic process; and

WHEREAS, Hydraulic mining, as heretofore prosecuted, has contributed to the injury of the navigable streams of the central portion of California, and to a small portion of agricultural lands of the valleys, and has in consequence been interdicted by the State and Federal Courts; and

WHEREAS, A board of eminent engineers, appointed by the Government of the United States, has, after an exhaustive examination, reported that by the erection of proper dams, barriers and catchment basins hydraulic mining may be resumed, the debris therefrom impounded and no material injury done to the navigable streams or to the agricultural lands of the State; and

WHEREAS, Under the comprehensive terms of restraining orders heretofore issued by the Courts, hydraulic miners are prohibited from discharging the tailings from their claims into the ravines, canyons and streams tributary to the main rivers, even though so impounded; and

WHEREAS, The said injunctions are not against hydraulic mining in name, but against the dumping of debris into the streams, ravines, etc., where the same will flow into the navigable streams and it would therefore include all classes of mines, should any action be considered necessary to prevent the detritus from said mines entering the streams of California; mining in California is hydraulic, being the same in principle, running water separating the gold from the matter in which it is imbedded, and

WHEREAS, The business interests of the whole State of California and the monetary interests of the United States demand that vigorous measures be adopted on the part of the Government of the United States and the State of California to enable the gold mines of California to be worked to their utmost capacity without injury to other industries; and

WHEREAS, The total cessation of hydraulic mining entails a heavy loss on those who have capital invested therein (such investments amounting to \$100,000,000), and a loss to the State and Nation of an immense quantity of gold which cannot be profitably mined by any other known method; and

WHEREAS, The navigability of the rivers of the State is of vital importance to everyone having interests in the State, whether miner, farmer or merchant.

Resolved, That in the opinion of this convention and under the report of said Board of Government Engineers, the most practical method of accomplishing said purpose of reviving hydraulic mining and protecting said navigable streams from further injury, is for the United States Government to construct, or cause to be constructed, restraining barriers in canyons of the Sierra Nevada mountains of sufficient strength and capacity to permanently and successfully impound the debris from said mines.

Resolved, That said dams, when so constructed, will prove beneficial to the navigable streams of the State, not only by restraining the debris from the mines, but will also restrain material coming from the natural wash of the Sierra Nevada mountains into those streams.

Resolved, That in view of the fact that the Government of the United States sold to the miner his claim and received the cash therefor for the express purpose, and with the full knowledge that it was to be mined by the hydraulic process; and in view of the fact that the credit and very existence of our Government has been heretofore saved by the output of the gold mines of California; and, in view of the further fact that in every financial crisis which may hereafter arise, relief must be looked for from the same source; and, in view of the further fact that the benefit of the gold product of said mines of California annually to the country at large has been and will continue to be of inestimable value, therefore, we deem it but just that the expenses of constructing such restraining dams should be met by the general Government.

Resolved, That we recommend the passage of such laws by the State and Nation as shall rehabilitate the industry of hydraulic mining upon the erection of such permanent restraining dams as may be certified by competent U. S. Government engineers appointed for that purpose by the Government of the United States as safe and sufficient in strength and construction to properly restrain the debris from such mines, and prevent injury to the navigable waters of the State.

Resolved, That this Convention approves and indorses the recommendation for the improvement of the Sacramento and San Joaquin rivers as contained in the report of the United States Board of Engineers on mining debris in California, dated Feb.

9, 1891. We also recommend the appropriation of the sums recommended by the Government engineers for the improvement of the said rivers and the Petaluma creek.

Resolved, That it is the sense of this Convention that the general public prosperity demands a speedy and amicable settlement of the hydraulic mining question; a settlement whereby the rights and interests of the miner and farmer shall each be protected and whereby millions of new money may be annually thrown into circulation among the people, and that all citizens having at heart the interests of the State, are requested to further, by all means in their power, such settlement and the reestablishment of the interests of hydraulic mining under such conditions as shall be fair to all interests, and for the better carrying into effect of such settlement, we recommend that the Executive Committee of this body be authorized to confer with the Executive Committee of the River Convention, in its opinion, the objects of this Convention can be subserved thereby.

Resolved, That for the purpose of obtaining titles to lands for mining purposes in the mining regions, that in all proceedings before the Land Department, the interests of gold mining require that such lands shall be presumed to be of more value for mining than for agricultural purposes until the contrary is shown, and we recommend suitable legislation to accomplish said purpose.

Resolved, That we deem it expedient that a committee of three be selected by said Executive Committee and sent as speedily as possible to Washington, to assist our Senators and Representatives in procuring the legislation recommended by this Convention, and we therefore direct our Executive Committee to immediately take the necessary steps to select such committee of three, and to raise funds sufficient to pay the expenses connected with their mission to Congress.

Resolved, That we recommend the formation of an association in each county in this State in the interests of mining, to cooperate with the Executive Committee to be appointed by this Convention.

Resolved, That we proceed at once to organize permanently a State Association for the purpose of promoting the mining industry in California. That the officers of such permanent organization consist of a President, one Vice-President from each county, a Secretary, Assistant Secretary, Treasurer, and an Executive Committee to be appointed by the President to consist of 11 members-at-large and one from each county represented, whose duty it shall be to promote the objects of this Convention.

Resolved, That a committee of five be appointed by the Chair, whose duty it shall be to formulate and promote the adoption of amendments to the mining statutes of the United States.

Mr. Burrows of Nevada moved the adoption of the report. Grove L. Johnson of Sacramento rose and said: "I desired the privilege, as a representative from Sacramento county, to have moved the adoption of the report of the committee on resolutions. I can now only second the motion, and I do it with my entire heart, and in full accord with the resolutions. [Great applause.] I second the motion for the adoption of the report and, if I may be pardoned for saying a few words in reference to the matter, Mr. Chairman, I will do so now." In response to cries of "Go on," and "platform," Mr. Johnson came upon the platform and made the most brilliant speech of the occasion.

SPEECH OF GROVE L. JOHNSON, OF SACRAMENTO.

When I accepted the appointment, Mr. Chairman, as one of the delegates from Sacramento to this convention, I did so with feelings of apprehension, because the result of the attempt to fasten the apparently irreconcilable element of this State into one compact, homogenous production, which should represent only the people of the State of California, seemed to me doubtful. Having met with this convention, having met with the representative miners of the State, having met with the men selected to represent them upon the Committee on Resolutions, upon which, through the courtesy of the chair, I was placed as the representative of a valley county, I desire to say that no body of men ever yet exceeded this convention of miners in their desire to make peace with their enemies and to cement friendship with them. [Great applause.]

I find every man in this convention animated by the same purpose that under God, I believe I have and feel, namely, to do all in our power to aid the miners of this State, and to once more pour forth from the mountains of the Golden State that we all love, the millions of dollars that shall aid the commerce, aid the people, and aid, if need be, in the thrice of battle, the Government of the United States. [Great applause.]

In pursuit of an industry which at one time was the sole pursuit in California, which at one time when you spoke of a Californian you meant a miner and nothing else, and in the pursuit of that industry through the creation of your scientific and improved processes of mining, injury was done to the people of the valley, injury was done to the navigable streams of California, and the people of California did that which you would have done: They raised in their might to protect themselves. The courts have decided upon that question, and to the will of the people you as good citizens bow. [Applause.]

The point still remained that the gold was there. The gold should be dug from the mountains. How can it be dug? I have respect for engineers. I have faith in engineers. I have faith in scientific men, and when the Government of the United States appointed a commission of men so skilled in their business as was the committee appointed to investigate the mining debris, I had faith in them, and when they reported, I read their report and had faith in their report. Having faith in their report, I am willing, for one, and I believe I speak the sentiments of all true lovers of the valley, we are willing to endorse the report and give the miners the opportunity to once again work their mines, to once again wrest from the unwilling soil the money that will make themselves and their families happy, that will once again fill the schoolhouses and the churches and will make the hum of industry again resound through all the mountains of the mining counties of California. [Great applause.]

I have heard it stated that it is impossible to impound the mining debris. I have heard it stated that scientific men have erred upon this question. For one, I have faith in the inventive genius of mankind. [Applause.] I remember, and I am not so old a man, the institution of the telegraph of this nation, and although but a hoy, I remember the speeches of men then in regard to that invention as they speak now in reference to these dams; but the telegraph wires are a success and Samuel B. Morse won undying fame by carrying to success his invention. I remember, and I was one of those who crossed the plains in early days before the railroad was built, that I, like other men, said: "It is utterly impossible to build a railroad across the deserts and over the Sierra Nevada mountains," and I thought the engineers were mistaken. I laughed them to scorn, but the engineers were right, and the headlight of the locomotive starts from the Atlantic, in this country, and speeds its way for 3500 miles across a common country until it shines upon the waters of the harbor of San Francisco. [Applause.]

I believe to-day that there are engineers able, competent and willing to solve this question and to properly construct these dams in such a manner as, in the language of the resolutions, to impound the mining debris and prevent injury to the navigable waters of the State. And that is all we ask; that is all any man ought to ask. That is what the people desire; and when you are with the people you are right; and we are all right upon this question, because it is for the benefit of one and all. [Applause.] I congratulate you upon the harmony that has marked your deliberations so far. I congratulate you upon the resolutions. I believe we are going to enter upon a new era of prosperity in this State. I believe that the general Government is responsible for this condition of affairs, and I believe [applause] if a united delegation goes to the national representative hall in Washington and the farmer hand in hand with the miner of California [applause] knocks upon the door of the Treasury of the Nation, it will be open to us to carry out these works that we have projected and that we have endorsed.

They tell us in the "good book" that when the Prophet Moses struck upon the rock the waters gushed forth and the thirsting Israelites were made happy and content. So we to-day knock with the iron and the pick of the miner and the plow and harrow of the farmer upon the rock of the national credit, and streams of prosperity will flow forth to benefit not only our State but our whole Nation. [Applause.] All that is necessary is to be united. [Applause.] All that is necessary is to be harmonious. Let the dead past bury the dead. [Applause.] Let all animosities be drawn and buried in the slinkens that you have deposited in the bed of the river. [Laughter and applause and cries of "hurrah, hurrah."] Let us clasp hands across not the bloody but the yellow chasm that separated us in the past, and as the two sections of this Nation are now standing shoulder to shoulder in defense of the national honor at Washington, and are laboring only to see who can do the most for America, let the farmer and the miner of California only be envious to exceed the other in doing good to our common State. Then the blessing of the Almighty will rest upon this favored land; and we will be prouder than ever of our State, and ready to transmit it to our children better than we found it. [Great applause.]

The CHAIRMAN: "Gentlemen, the question is on the adoption of the report of your committee on resolutions. Are you ready for the question?" [Cries of "question, question."] Motion is carried.

The CHAIRMAN: "They are united with a hurrah." [Great applause.]

COMMITTEE ON MEMORIAL.

"The next business in order is the report of your committee on memorial. You will now hear from that committee.

"It affords me very great pleasure to introduce to you Charles G. Yale, editor of the MINING AND SCIENTIFIC PRESS, a gentleman who has, perhaps, given more thought and as much labor to this important question as any man in the State of California, and from him you will get a lucid statement in this memorial." [Applause.] Mr. Yale spoke as follows:

Gentlemen, after having been so pleasantly introduced I think the best way for me to reciprocate is to refrain from making a speech. The fact of the matter is I have talked about eleven miles of talk in the last three weeks, and whatever ideas I may have had have been expended on the gentlemen who have no ideas upon this subject. It would be entirely unnecessary for me to talk to all of you who know more about it than I do, but as far as the talk has been in the past it has been, I hope, where it would do the most good.

The committee of which I have the honor to be the Chairman met last night, and this subject of memorial was carefully discussed. It met again this morning, and the work it has accomplished is best shown by what I have to read. It is very short.

On motion of W. W. Kellogg of Plumas, seconded by J. B. Hobson of Placer, consideration of the committee's report was made the first order of business after recess. Mr. Kellogg said that from the reading, as he understood it, there were some words in the interests of the miners of California that should be inserted in the memorial.

The Afternoon Session.

As soon as the convention was called to order the Chair stated that the Committee on Memorial had discovered that in one particular their report did not agree with the resolutions already adopted by the convention, and they asked leave to temporarily withdraw the report for amendment. This was granted.

While the committee were absent a number of resolutions were introduced and referred to the Committee on Resolutions. Among them was one by James H. Law-

rence of Merced, relating to mineral lands in the Yosemite Park, including portions of Mariposa and Fresno counties, and asking Congress to exclude said mineral lands from the park boundaries. One was introduced by C. McTarnahan of Butte, relating to dams and flumes; one by Mr. Tulloch, proxy of C. D. Lane of Calaveras; one by Hobson of Placer, requesting Boards of Supervisors of Counties to appropriate money to pay expenses of a delegation to Washington; also the appointment of a committee of three to formulate an address to be circulated among the people of the State, together with a copy of the Report of the U. S. Board of Engineers.

The following was offered by V. S. McClatchy:

Resolved, That Congress be requested by this convention, in passing any laws providing for methods of continuing hydraulic mining without injury to other interests, to embody in all such laws a proviso that no Chinese shall be employed on any work constructed to furtherance of the Government policy or on any mines which may be operated under protection of such work.

This was seconded by Walrath and passed under suspension of the rules.

E. B. Price of Butte introduced a resolution, suggested by the Butte delegation, thanking Thos. B. Everett of Placer for his efforts in originating the plan of the State Convention, and his labors in carrying on the work. This was adopted amid great applause, under a suspension of the rules.

On invitation, Hon. Patrick Reddy of Inyo addressed the convention briefly, saying he was pleased indeed to find the proper spirit prevailing in the convention, since in this spirit, we can accomplish everything.

MR. CLUNIE'S REMARKS

Mr. President and Gentlemen of the Convention: I came down here to see the lion and the lamb lie down together, and I believe from all of the reports of this convention that they are getting along very nicely.

Of course we are all interested in every industry of this State. We are all interested in the mining industry. There is no calling in this or any other State of so much importance as the digging of gold out of the earth, because it adds that much to the material wealth of the country. It is not made by swapping jack-knives among ourselves, but it is that much added to the circulating medium of the country.

I believe, as I always have believed, that it is the duty of Congress to take hold of these important matters. I believe that not only the valley men but the mining men are proceeding in a way that will show good results for the miners of this State, and when you show good results for them you show good results for the entire State of California. You and I know, my friends, that if it had not been for the money dug from the State of California, from your soil, that the chances are we would have no country to-day. [Applause.] It was the gold of California that preserved the credit of the nation in its darkest hours [applause], and if there ever was an industry that ought to be fostered and encouraged it is the great industry of mining; but no honest miner that has justice in his composition can find any fault with the valley man or with the agriculturist, when he says that that great industry must not be prosecuted as to interfere with the industry of their neighbors. [Applause.] We have all come to that conclusion. We have joined hands together, and I feel confident that at this or at a future session of Congress, means will be afforded you to pursue this great industry, and in such a manner that in place of injuring the valleys, they will be greatly benefited. [Applause.]

In the days, my friends, when the lamented Abraham Lincoln was President [applause] of the United States, he called upon the State of California to furnish money and supplies and we did it without a murmur, the miners, God bless them, standing by him; and when he called upon us we furnished to the nation several millions of dollars, and from that day to this California never has received one single dollar of it. [Applause.] And yet, my friends, all of the States of this Union, except the Pacific Coast States, have been repaid. I say to you, could not the General Government put up a portion of this indebtedness in solving this problem? California would readily agree to this. Would it be asking too much? The General Government owes this money to us. It admits it. It is there in the treasury and it justly belongs to the people of the State of California. I say for one, as a citizen of this great State, that when we go there, backed up as we are by these facts and figures, we are bound to succeed.

In looking over the list of appropriations for the last 40 years—50 years, I might say, I found that 97 per cent of the appropriations have been given to the Atlantic States, while we have had to be content with only three per cent, and yet when you go to the archives of the Government to find out how much this great State of yours has contributed annually, you find its citizens paying into the National Treasury sixteen millions of dollars every year [applause] taken from the pockets of the people of California, who have already added to the wealth of the country \$1,200,000,000 in gold and silver. I say in the name of justice, we are not asking too much of the Congress of the United States when we say to them: "You sold the mine to the miner, you sold the land to the farmer; and these great industries, in order to have our State flourish, must go on hand in hand, and it is your duty to take such steps as are necessary to point out that way." I know that your appeal will be heard. I know

that you will be successful, and every man who has taken part in this grand convention will feel that he has rendered the State service.

Gentlemen, I had no idea of making a speech to you. I was told that I had the distinguished honor of being elected one of your Vice-Presidents, and I want you to understand that I esteem it an honor, because when I represented in part the people of this State in the State Senate, I opposed a bill to build dams by everybody who wanted to mine. I knew that there would be no responsibility attached to it. I knew that when we got through with our mining, that so far as the individual owners of those mines were concerned, the dams would be abandoned. They would have no more use for dams. The ground would be worked out, and I said it would not do for us to begin that sort of business; but when I suggested, as I did two years ago in Congress—I believe I was the first man to make a speech on this subject there—that it was the duty of the General Government to take hold of it, and when I found the miners all over the State recognizing that proposition, and desiring to fight for it, I felt that it was my duty as a citizen of this State to do all that I could to protect and to preserve and to foster that interest, and I want to say to you now, that with the Government at our back, that any plan suggested by them will meet my approval, and you will find me walking hand in hand with all of the miners of the State to bring about legislation that will foster both of these interests.

I was proud, my friends, when I saw my friend of many years, young Val. McClatchy, get upon the stand here and make the speech that he did. It showed that he was a noble son of a worthy sire, representing as he does the great and populous city of Sacramento, the capital of our State. He came here to join hands with the miners, and so did all of the delegations from those valley counties, to work together for a common end. I know and feel in my heart that you will be successful. I know in my judgment, with equities on our side, with the general Government in our debt millions of dollars, and interest for a quarter of a century, that they can not refuse the just requests of this convention. Gentlemen, I thank you, and will now give way to my friend, Gov. Johnson. [Great applause.]

Ex-Lieut. Governor J. A. Johnson then addressed the convention briefly.

THE MEMORIAL AGAIN.

The Chair announced that the Committee on Memorial was ready to report.

Chas. G. Yale of San Francisco said: "The very limited time at the disposal of the two committees, gentlemen, led to a slight conflict. The report of the Committee on Resolutions having been adopted by this convention, it was found that one of the paragraphs in the memorial did not agree with that report. Therefore, with your permission, the Committee on Memorial has changed that. I will read you the original paragraph and then the substitute. I wish to state, gentlemen, that this meets the objections of Mr. Kellogg of Plumas and others." [The slight changes made, with the amendment offered by J. M. Fulweiler of Placer, are incorporated in the copy herewith given.—ED. PRESS.]

Mr. Hobson of Placer wanted to specify the number and location of dams, so as to cover other districts than those mentioned in the Government reports. Mr. McTarnahan of Tuolumne also wanted this point covered.

Mr. Devlin of Sacramento thought Mr. Hobson misconceived the scope of the memorial. The report of the Commission does not provide for the erection of any dam at any place at Government expense. The convention was called to ask Congress to erect dams wherever they can be erected with safety and wherever they will restrain debris. All we ask Congress, is to make an appropriation sufficient to carry out the report of that Commission. The memorial fully expresses the sentiments of this convention. There has been no desire on the part of any member of that Committee to limit the erection of dams at any particular place.

F. R. Dray of Sacramento thought the wording of the memorial covered the entire mining districts of the State. On request, the Secretary again read the memorial. Mr. Tulloch spoke at some length. Mr. McClatchy, after the memorial had been read, said that it was general in its terms. It embraces every county in the State. That nowhere is any river or tributary specified with regard to hydraulic mining, and that everywhere does it say that the Government shall take care of hydraulic tailings so that they shall not injure the lands below, without specifying in any way, the locality.

Mr. Fulweiler's amendment (incorporated in the memorial) was introduced. Mr. McClatchy thought it unwise to patch the document. He was satisfied that every line and word in the amendment, with the exception of the last half dozen words, was already embodied in the memorial. Mr. Fulweiler said he had presented the amendment in the interest of harmony. There are always in a body of this nature and character men of different minds; men who

cannot see as clearly as my friend McClatchy can; who cannot take a few words and make sense of them. What difference does it make to us if by adding a few words and with the aid of a dictionary before us we harmonize matters. It is for this purpose alone I present it for your consideration; and I do not think the Committee on Memorial desires to employ any more time on a thing of that character, which only reiterates a little more particularly the language which the memorial contains anyway.

J. M. Walling of Nevada said: "It seems to me that the misapprehensions relative to this memorial grew out of this fact: All our proceedings and resolutions seem to have as a basis the report of the Briggs Commission, and consequently some of the mine owners feel that that report is local in its character, and that some general word which may be construed fairly to include the whole State ought to be put in. I think that is the only matter of dispute between us. It can be arranged in a few words, and I think it is wise to do it, rather than have any friends of the movement going away feeling that they have not been properly recognized." [Applause.]

THE MEMORIAL TO CONGRESS.

To the Honorable the Senate and the House of Representatives, in Congress Assembled: Your memorialists, representing the people of the State of California, in convention assembled at San Francisco for the purpose of considering the question of hydraulic mining and the improvement of the waterways of the State, respectfully represent:

That for many years there has been a conflict between the farming and hydraulic mining interests of California by reason of the debris from said mines injuring the navigable rivers and lands bordering thereon. By decisions of the federal courts injunctions were issued against these mines and they were closed down, throwing many persons out of employment and causing great loss of capital invested in mines, ditches, etc., and a great industry paralyzed. The legislature of the State of California, realizing that a rehabilitation of this mining industry would benefit the people of the whole State and nation if it could be accomplished by joint resolution, brought the matter to the attention of Congress.

In accordance with this resolution, Congress passed an Act appointing a commission of engineers for the purpose of ascertaining if some plan could be devised to adjust the conflict between the mining and farming sections and the mining industry rehabilitated, and for examining the navigable rivers and their tributaries with a view to improvement and rectification of the rivers.

That, whereas, this Board of Engineers Officers constituted, under the provisions of this Act of Congress entitled "An Act for the investigation of the mining debris question in the State of California," approved Oct. 1, 1888, have made an examination and investigation of the mining debris question in the State of California for the purpose of ascertaining whether some plan could be devised whereby the present conflict between the mining and farming sections might be adjusted and the mining industry rehabilitated, and have made an examination of the injured navigable river channels, and their tributaries and lands adjacent thereto, with a view to the improvement and rectification of said rivers;

That it appears from said report that there are many hundreds of millions of dollars of gold in the auriferous gravel deposits of California which can be extracted by the hydraulic process, filling the arteries of commerce and stimulating to increased energy all the industries of this State and of the nation, and that wise statesmanship demands that this vast amount of gold should be added to the wealth of the country, if it can be done without material injury to the navigable rivers of the State and the adjacent lands;

That it appears by said report that dams and other restraining works may be erected in many of the canyons, which will not only restrain the material producing the damage complained of in the past, but will also restrain the debris now dislodged, but still remaining in the canyons.

We respectfully ask that your honorable body accept and adopt the report of the commission appointed by you for the purpose stated, and that Congress at once take steps to put into practical and effective operation the means suggested by the engineers in order that mining may be again resumed in the manner indicated without the injury complained of in the past.

Your memorialists further suggest that Congress, having appointed this commission to determine the question, should accept and act upon its conclusions, which are of a nature to be acceptable to both parties to the controversy, in that they provide that mining can be again carried on under the conditions named, and also that the debris will be restrained from the rivers and farming lands.

It is proper to represent also, that at four different sessions of the legislature of the State of California resolutions have been adopted calling the attention of Congress to this hydraulic mining question in California. At the last session the Governor, in his inaugural address, brought the matter again to the attention of the representatives of the people, and the legislature on March, 18th, 1891, again passed resolutions which were forwarded to Congress, setting forth the facts and asking for relief.

We recognize the fact that until Congress takes proper action for the erection of suitable works for the restraining of mining debris, hydraulic mining is absolutely restrained by the

courts, and as law-abiding citizens, we recognize that the laws must be obeyed and the decrees of the courts respected; and inasmuch as the complete cessation of hydraulic mining until congressional action is had will be a great hardship to the mining regions and may result in their depopulation, we earnestly request you to take immediate action, in order that there may be an end of conflict and that no complaint may exist of enjoined mines refusing to obey the orders of courts.

We earnestly request you to make sufficient appropriations for the erection of dams or other restraining works in accordance with the report of said commission under such restrictions as to locality, size and extent of dams as may by law be provided for that purpose, in order that the debris resulting from hydraulic mining may be restrained as contemplated in said reports; and that said restraining dams shall be built in such rivers and streams and at such places therein as the needs of the mining industries and for the protection and preservation of farming and other interests of the State may require, as may be recommended by the Government engineers, and that all such dams shall be built and maintained at Government appropriation and expense.

That we recommend the appropriations recommended by the Government engineers for the improvement of the Sacramento, Feather and San Joaquin rivers and Petaluma creek. The commercial interests of the State of California and of the whole nation imperatively demand that these appropriations should be made.

Your memorialists above respectfully represent that the miners of the United States are dissatisfied with many of the rulings of the departments, which put unnecessary burdens upon them and prevent them from readily obtaining lands to the detriment of the mining interest. We respectfully ask that prompt Congressional action be taken upon the resolutions on the subject of the mining laws and department rulings, which were adopted at the California State Mining Convention, held in San Francisco, January 20, 1892.

Mr. Kellogg of Plumas wanted the amendment adopted, as it specified the Government must build the dams. Wm. Young, of San Francisco, also urged this point. Mr. Fulweiler's amendment was then read. The individual members of the Committee rose in their places and endorsed the amendment, including the Chairman, Mr. Yale, who stated that he very heartily endorsed it.

On motion then, the report of the Committee on Memorial, as amended, was unanimously adopted, amid tremendous applause.

THE STATE ORGANIZATION.

Dr. Schnabel, of Placer, suggested the immediate organization of a State Miners' Convention, but it was found that the resolutions already provided for that.

Grove L. Johnson, of Sacramento, in a neat speech, nominated Jacob H. Neff of Placer, for President of the Miners' State Association. He was seconded by E. M. Hull of Alameda, and Kellogg of Plumas.

Recess was taken for three minutes to allow the delegates from each county to select a Vice President from each county, except San Francisco, which is to have five Vice Presidents in accordance with the resolution adopted by the convention. The names are given elsewhere.

W. C. Ralston was nominated for Secretary and was unanimously elected. He said: "Gentlemen, I thank you. I have been working very hard for the last three or four days. I thank you for your kindness in electing me Secretary of the State Miners' Association. I have been a miner for a number of years, although still quite a youngster. My sympathies have always been with the miners and the industry, and I hope they will always so continue. I will try and fulfill the duties to the best of my ability."

THOS. B. EVERETT.

Mr. T. L. Ford of Sierra presented for the position of Assistant Secretary the name of a young man who had the honor of originating the movement whereby this convention is now held—Thos. B. Everett, of Placer county.

Mr. Neff said: "At the inception of this movement, Mr. Everett was in Auburn, and in conversation with a gentleman who published a paper there, suggested the idea, why not have the miners come together, organize an association and ask the good people of the valley to come and consult together. The gentleman of the press (Mr. Filcher) said it was an excellent idea. 'You write out a little bit of a note calling for a meeting and we will notify the mining men of the county to hold a caucus.' I was in Auburn at the time serving as a grand jurymen, and, walking in to the meeting, was made chairman of the caucus. The meeting was attended by the best elements of the county, regardless of calling, some farmers, some miners."

"We noticed we struck a popular chord. We called the county convention and they called this State convention. Mr. Everett acted as secretary. He has labored well and industriously, been at his post almost

(Concluded on page 88.)

SHEET
IRON
PIPE

ALL SIZES, FOR GAS, STEAM AND WATER.
— WE MANUFACTURE —

SHEET IRON AND STEEL PIPE, ALL SIZES.

For Water Supply, Mining, Irrigating Purposes, Stock
Ranches, Etc.

Made in Lengths Desired from 16 to 30 feet.

The Cut shows a Section of Three Joints

DOUBLE RIVETED SHEET IRON PIPE.

In the manufacture of this Pipe, we use only a high grade of annealed
Charcoal Iron of great tensile strength.
The weight or thickness of metal used, is graded according to service
required, and pressure to which the Pipe will be subjected.

FOR ALL UNDERGROUND PURPOSES, we immerse the Pipe
in a bath containing a special mixture of ASPHALTUM, BITCH and
PETROLEUM, at a Temperature of 300° Fahrenheit. It thus
receives a thorough coating, both inside and outside, rendering it impervious
to the alkalies of the earth, rust, etc., and is practically indestructible.

CORRUGATED IRON,

Black, Painted and Galvanized, for Roof and Sides of
HAY BARNs, DRY HOUSES, STABLES, ETC.

RISDON IRON WORKS,

Cor. Beale and Howard Sts., San Francisco.

COMMON SENSE PULVERIZER AND CONCENTRATOR.

This is the Most Successful Machine yet discovered for working gravel, cement, clay, etc. It avoids crushing the rocks, which are washed clean, while at the same time it pulverizes the CEMENT or CLAY, and

SAVES THE GOLD ALTHOUGH IT IS AS FINE AS FLOUR.

It is only necessary to have from four to six inches of water to work 100 tons or more every 24 hours.

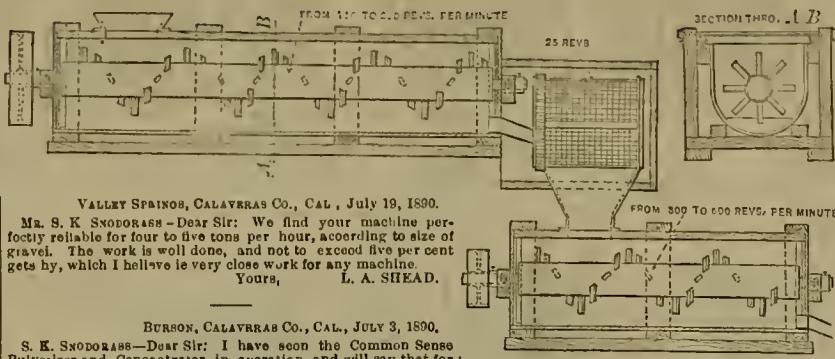

The machinery consists of two iron troughs or "concaves," each 26 inches in diameter, one of which is about 18 and the other 12 feet long.

In these troughs are strong revolving shafts with projecting teeth, made of steel, two inches wide by three-quarters of an inch thick, placed in spiral form around the shaft, about two inches apart, forming a conveyor.

The first shaft is arranged to revolve from 150 to 250 revolutions per minute, and the second one from 300 to 500.

There is a revolving screen between the two troughs that takes out the coarser rocks after being washed, and only the finer material runs into the second trough, and is there worked thoroughly.

There is a space of about four inches in the bottom of each trough, or "concave," that fills up with gravel and sand. When the gold is freed it settles into this, and as the teeth do not disturb the bottom, the gold remains there until a cleanup is made.

VALLEY SPRINGS, CALAVERAS Co., CAL., July 19, 1890.

Mr. S. K. SNODGRASS—Dear Sir: We find your machine perfectly reliable for four to five tons per hour, according to size of gravel. The work is well done, and not to exceed five per cent gets by, which I believe is very close work for any machine.

Yours, L. A. SHEAR.

BURSON, CALAVERAS Co., CAL., JULY 3, 1890.

S. K. SNODGRASS—Dear Sir: I have seen the Common Sense Pulverizer and Concentrator in operation, and will say that for all kinds of gravel and clay it is the best machine I have ever seen.

Yours respectfully, A. J. KNAPP, Miner for 25 years.

PLACERVILLE, CAL., July 15, 1890.

S. K. SNODGRASS—Dear Sir: I have worked with your machine in two counties, and have never seen the equal of it for washing gravel or saving fine gold. I have helped to clean up and found fine flour gold. I have put through it at the rate of 100 tons and over per day, and have also prospected the tailings thoroughly and found no gold in them. I have talked with other parties who have worked with them and say they are a good machine. Have been mining over 25 years.

Very respectfully, D. G. HUOHES.

VALLEY SPRINGS, OAL., June 30, 1890.

S. K. SNODGRASS—Dear Sir: I have seen the working of the Common Sense Pulverizer and Concentrator in clay and all kinds of cement, and have examined the tailings, and will state that I have never seen work done by any machine that compares with it. I have seen it when working from 100 to 150 tons per day, and been present when cleanings were made, and seen gold as fine as flour. I would recommend it for using in any kind of placer mining. I have been mining for 20 years.

Yours, J. D. COOK.

SAN FRANCISCO, March 25, 1891.

S. K. SNODGRASS, Esq.—Dear Sir: In regard to the work done by your machine, which we have had in operation for the past three months, I can say that it has handled successfully all material as taken out of our ground, the only cement which was not perfectly broken up being an exceedingly hard cemented material approaching rock in its hardness.

For all free wash and moderately hard cement it will do very good work, and must effect a great saving in working such gravels and cements, owing to the small heat of water required; and furthermore, its great gold-saving qualities, as I am satisfied that fully 95 to 98 per cent of the gold freed in the machine is saved, even to flour gold, and that too without the use of quicksilver.

The automatic rejection of all rocks and material by the revolving screens make the handling of the gravel cheaper, as all hand culling of the material is rendered unnecessary.

Yours truly, W. W. B. STEVENS.

CHILI GULCH, CALAVERAS Co., CAL., July 16, 1891.

Mr. SNODGRASS—Dear Sir: I was down to Spring Valley looking at the machine and it runs very nice and a great deal better than I expected. If you can make them work as well as that one it is the finest machine in the country, and I examined it thoroughly. I have been around gravel mines for the last 30 years. Yours respectfully, STEPHEN M. HUOHES.

State Miners' Convention.

(Continued from page 83.)

continually, and I think sent out about 25,000 copies of the address prepared for the occasion. He should be honored at least with the position of Assistant Secretary of the Miners' Association. I simply make this statement in justice to Mr. Everett."

Mr. Everett was unanimously elected Assistant Secretary. Henry Pichoir, of San Francisco, was chosen as Treasurer, on nomination of C. W. Cross.

A motion made by J. M. Fulweiler was carried, that each man accredited to the convention, and acted on favorably by the Committee on Credentials, should be a member of the State Association.

By a rising vote, the thanks of the convention was tendered to the San Francisco delegation, for the magnanimous manner in which they treated the convention.

An adjournment was then taken until 8 P. M., the meeting to be held at that hour in Pioneer hall.

The Evening Session.

As soon as the convention was called to order, Mr. Cross of the Committee on Resolutions said that the various resolutions referred to his committee had been acted on as far as possible in the limited time, and he reported that all the resolutions offered had been reported to the Executive Committee for proper action.

Mr. Huhn of Plumas addressed the convention briefly, suggesting that Sutter and Yuba and other counties that have enjoined the Plumas miners might dismiss the suits, and that will be a great starter on this great work of harmonizing the interests.

A delegate from Butte, a resident of Oroville, also spoke in favor of this action, and spoke of the dam across the main Feather river, above Oroville, built by Col. Frank McLaughlin, which has stood so well.

The thanks of the convention were returned to the permanent officers. Mr. Luttrell heartily concurred. He thought this the most important convention that ever assembled in the State. "It is one of the most intelligent bodies of men I ever had the pleasure of meeting with. You have accomplished a great work, and I look forward to great results. Owing to the unanimity of feeling which has been expressed here, I say let by-gones be by-gones. Let us pull shoulder to shoulder for the common cause and prosperity."

HON. C. P. BERRY'S SPEECH.

D. T. Cole of Sierra thought the convention would be very much pleased to hear from Hon. C. P. Berry of Sutter.

That gentleman, on request, went upon the platform, amid great applause, and said:

Mr. Chairman and Gentlemen of the Convention: I am not in the habit of speaking in public, and I feel, especially at this moment, somewhat paralyzed by the remarks of my warm and personal friend from Plumas in regard to Sutter county and our prisoners. As I have been so kindly invited to say a few words, I want to make a statement, and I will make it, because I am one of those people, and my people have been heavy sufferers in the valley, and I realize that at this moment my little county and the valley portion of Yuba county are located in the hotbed of the antining sentiment. I want to say to you here to-night, whatever may be your opinion of us, that we have felt in the fight that we made that we were fighting for self-preservation, and we had no personal enmity to the miner, and to-night, I, as an individual, rejoice at the turn that affairs have taken in this convention. I believe it forholds good. I believe that nothing but good results can follow from our action here. We have never contended for anything except that we should not be materially injured. You gentlemen here have pledged yourselves, since we have been forced into the courts to vindicate our rights, to accept the situation and the law as it stands; you have agreed with us here that you will recognize the law, and that you will obey its edicts until you can find a way out. Since you have done that, we join heart and hand with you, and we will say that our efforts that have been put forth before for our self-preservation shall now be put forth in your behalf, and look to the General Government to devise means by which the mining industry can be rehabilitated and by which the prosperity of the State may be advanced. (Applause.)

I wish to disabuse the miners here present of a feeling that perhaps prevails among them, and that is, that we are antagonistic to the mining interests. Such is not the case. We in the valley recognize the great importance of the output of gold. We are as anxious for your gold as you yourselves dare be, and we are willing to shovel mud and build levees, and drink muddy water, to the extent that we can, and yet exist, in order to get your gold. (Laughter and applause.)

We are not cranks. We don't wish to suppress any industry that tends to build up this great State. We look forward to the time when there will be means devised by which all the industries of this State can be prosecuted, and by which all its industries can be carried to the highest point. We look to the time when the hills will be full of industry, when we expect to see not only the mining operations in full blast, but the overflowed foothills protected by dams and other improvements, and we will have vineyards and orchards and water rights, and have industries and manufactures all over the foothills; and our great valleys will also be preserved and protected, and our rivers—those are perhaps

more important to California than every other industry—we must have our rivers, and while we have acted for self-preservation, it has also been for patriotism.

We wish this great State preserved. We wish that our rivers and our harbors should be preserved in their greatest efficiency, and we want our State and every industry in it developed, and to-night we are with you to join hands and to devise means by which our highest efficiency can be obtained.

Miners, we have accepted the pledge you have given, that is that you will obey the laws, and that we will not be compelled hereafter to send spies into the mountains to see whether you are invading the law or not; and therefore, accepting the pledge that you have given to us, now we are willing to second any effort that you will make so that the mining industry will be rehabilitated. (Applause.) It is because of this pledge that you find Sacramento county and Yuba county and Colusa county and the other counties of the valley helping you; otherwise, if we did not think you were sincere in this, we would still be compelled to throw ourselves upon our rights and contend for them.

Hoping that the results of this convention will result in your highest expectation and in ours, I thank you for your attention. (Applause.)

Mr. George Ohleyer was invited by the chairman to address the meeting, but did not respond.

THE MINERS NOT LAWLESS.

Mr. C. W. Cross, of San Francisco, desired to make a few remarks in reply to those of Rev. C. T. Berry. Mr. Cross said:

Mr. President, as one who has had occasion to be very familiar with the matters to which Mr. Berry mainly addressed himself, by reason of connection with litigation that has been carried on between the farmers and miners over the hydraulic mining question, I desire to say that the facts will bear out the statement that the miners of this State have shown themselves truer and better adherents to the laws of this State and of the commonwealth than did any other class of men under such trying circumstances ever show in the world. (Applause.) I will prove it to you. Mr. Berry, in his remarks, alluded to the matter of the Anti-Debris Association having sent spies into the mining region. Not only has the Anti-Debris Association sent spies into the mining region, but the United States Government has sent its spies into the mining region. For the period of five years and more, aye for the period of seven years, the spies spoken of by Mr. Berry have been constantly in the mountains roaming up and down the hydraulic mining regions continuously and in large numbers for the very purpose of ascertaining whether there had been any violation of the injunctions of the courts. The injunctions of the courts have destroyed property of the value of not less than one hundred millions of dollars. They ruined the means of livelihood of nearly one hundred thousand people; they utterly wrecked one of the most prosperous industries that ever existed in the history of the world. It was an industry which, owing to its peculiar location, could be carried on surreptitiously. The result of these spies roaming up and down the mining regions for seven years has resulted in but sixteen charges of disobeying the laws. Any other class of men would have done something to resist those decrees, and the only reason why the miners did not was because they were a law-abiding people and wise counsels prevailed. It was well understood that the day would come when to the law-abiding citizen would come a favorable law, and the results of the deliberations of this convention indicate that that time is close at hand. These spies sent to the mining regions were sent there for the very purpose of seeing that the gold product of that entire region, so far as it resulted from hydraulic mining, should be cut off, and that product was of the value of from ten to twelve millions of dollars a year. Those spies frequently were men of excellent demeanor. Sometimes, unfortunately, and I believe without the knowledge of their employers, they were not, and yet with all those men roaming through these mountains by night and by day, in the daylight upon the hills and at night in the canyons, there was never a hand raised against any of those men by any of the men connected with the mining industry. (Applause.)

Let me point you to a case in my own county, and I do it in no spirit of hostility. When the decrees of the courts were rendered with regard to shutting off the water from the valley counties of this State, armed men organized and went en masse and prevented the carrying out of the decrees of the court. If there is a parallel to be drawn between those engaged in different pursuits, there can be no question but what the miners have shown themselves men among men and the peers of any people in obedience to the law.

I said that only sixteen charges for the violation of these decrees had ever been made, and many of those when they came to the court could not be proven even by the evidence of these spies. I do not say this in any spirit of animosity. I want those of the farming people who have called us vandals, who have spoken of us as carrying on a barbarian business, to understand that there has never been a law against this kind of thing except the decrees of the court; that is, there have been no statutory provisions against these things. It has been only the decrees of the court, which this convention is not disposed to question. There is nothing in the conduct of those people to indicate that they are vandals or are not law-abiding.

THE SAN FRANCISCO DELEGATION.

There is another thing that is worthy of consideration by this convention, and I think it would be well worth while to mention the fact when you go home and let the newspapers state the fact that this convention has been the largest representative convention that ever assembled in the State of California; that this convention in its constancy has represented a larger amount of wealth in the State than has ever any convention that ever assembled in this State, and we have been making some figures. Take the San Francisco delegation, and there never went into any political or other convention in the State a delegation from San Francisco representing the wealth and influence that that delegation in this convention represents; and if you will figure up the money interests of the San Francisco delegation in this convention, you will find that it represents wealth enough to buy the county of Yuba and the

county of Sutter and the county of Colusa and three times as many counties of just the same wealth. (Applause.)

I have been requested by some of the members of the San Francisco delegation to say just a few words on their behalf about delegates from other counties. The San Francisco delegation, as soon as it was regularly appointed, had a meeting and appointed a committee on reception of the members of the convention. It has done all that it could find an opportunity to do. The convention has been short. You came just about as the convention was about to assemble. We had but little opportunity to either receive or entertain you. We have been sitting in convention with you during its business hours, and have been busy much of the time out of the convention hours. It has been in no spirit of unbecomely if you have not received every attention that you could have desired, and it is the regret of this delegation that you go away so soon, before we have an opportunity to entertain more of you at our homes. We do not find in this convention one man that we could not decently and gladly entertain in any home in San Francisco. On the other hand we send to you the thanks of the San Francisco delegation for the pleasant manner in which you have greeted us on every hand.

THE FEELING IN THE METROPOLIS.

I will give you a pointer on the strength of this movement in San Francisco. When it was proposed to appoint delegates to this convention the leading business men of San Francisco, and representing the strong financial interests, came forward and requested the privilege of being delegates to this convention. If we had been allowed three or four or five times as many delegates, the places would have been all claimed. The difficulty has not been to get a full delegation of members representing the very best interests of San Francisco, but it has been how to keep out the large number of bankers and others who wanted to come into this convention; and after the delegation had been appointed, and as soon as this convention met, good, able and influential men of San Francisco have been rushing about the streets to see if they could not get some proxies to get into this convention and help along this work. (Applause.)

The business interests of the metropolis are largely involved in regard to the action of this convention and Congress with regard to the matters here proposed, and the San Francisco business men, the more intelligent and financial class, desire the very thing that this convention desires. They want the gold to come here and they want it to go into the banks; they want it invested in real estate, and they want to make further improvements, and gold is necessary in order to do it. They understand that the markets of the mining counties in this State are the best markets that any city ever had for manufactured and agricultural products.

Gentlemen, I did not mean to speak so long when I rise, and yet I have not said all I wanted to say. It is a matter of utmost importance, that when the delegates return in their homes, that they make haste in form in each county a compact organization to help forward the purposes of this convention. Do not come down here and resolve and go home and do nothing. Make your organizations go to work like some of the counties have already done.

Assist the State Miners' Association and its executive committee, and give to it every element of strength that you at home can give. But a small number have come from the country, but at home there are a large number who can help this movement and will do so. Arouse the influence at home. Do you understand what this Anti-Debris Association has accomplished? I want to see on the miners' side some of the spirit and movement that has been shown on the other side. I want to see them make a vigorous and earnest struggle, because we shall need it before we get through with this work. I thank you. (Great applause.)

A WORD FROM SACRAMENTO.

O. HARVEY, of Sacramento: I want to say one word in response to the numerous compliments that have been paid to the members of the Sacramento county delegation. I feel a good deal as Mr. Berry expressed himself—paralyzed, or more than paralyzed, at the unanimity that has resulted in the acts of this convention. At one time I had made up my mind it was not worth while to come down with that delegation to this convention, for the feeling that had formerly existed among the miners and the anti-debris people was so decided that I thought we could not obtain results; but I want now to say, in my judgment there never has been a time since this conflict commenced between the miners and the farmers (and we were all miners once) but what, in parliamentary language, it was in order at any time since this conflict commenced to do the very same thing we have done here to-day.

It has taken a long time to bring about this result, but I want to say for Sacramento county, which has been so complimented here, that we have acted in good faith, and we joined this convention heartily and hope it will reach its highest expectations.

M. H. MEADE, of Sierra: I rise for the purpose of requesting the members of this convention from the country to extend to the delegation of San Francisco a rising vote of thanks for the manner in which they have entertained the country delegates, and for their noble liberality in defraying all the expenses of this convention; and I therefore move that we extend a rising vote of thanks to the San Francisco delegation. (Motion seconded and carried unanimously.)

THE NEVADA COUNTY ORGANIZATION.

A. TREGIDGO, of Nevada: There was a gentleman, I think from Siskiyou county, wished to know something about our organization. As I have the honor to be the President of the Nevada county organiza-

tion, I think it is my duty to tell him what I know about it.

Gentlemen of the Convention:—I am not a speech maker, but simply a plain, ordinary miner, and when any person wants something that is hard to be done they always ask me to do it. We of Nevada were the first to respond to the call of our sister county Placer, and since that county started the ball rolling and we fell in line, I am delighted to see that every county in the glorious State of California is in line. We have organized and passed resolutions. We have an organization whereby we will allow everybody in Nevada county to come into that organization by paying one dollar, and he receives a certificate. We had 5000 certificates printed, and my secretary tells me he thinks it is better to have a few more printed before I get home. Everybody is coming into line.

Gentlemen, I hope that every county in the State of California will follow our steps in organizing and taking everybody into line, because those who are not directly interested in mining are indirectly interested, and they are all to reap the benefit of it. Then these county organizations will be under the State organization, will be subservient to the State organization and do what the State organization calls us to do, and furnish them with money. When our delegates go to Congress and say, "We are the representatives of 200,000 or 250,000 people," we have a voice and we will be heard. That is the way I think about it. Gentlemen, I thank you. (Applause.)

On motion of J. K. Thornton of San Francisco the convention adjourned sine die.

A band was in attendance and escorted Chairman Neff and the members of the convention to the Palace Hotel.

Assessment Notices.

GOULD & CURRY SILVER MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees, held on the 5th day of January, 1892, an assessment (No. 68) of Thirty (30) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room 69 Nevada Block, 309 Montgomery Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 8th day of February, 1892, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on TUESDAY, the 8th day of March, 1892, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

ALFRED K. DUNN, Secretary. Office, Room 69 Nevada Block, 309 Montgomery Street, San Francisco, Cal.

SAN FRANCISCO MILLING AND MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, West Point, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 12th day of January, 1892, an assessment, No. 1, of Two (2) Cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States gold coin to the Secretary, at the office of the Company, Room 56 Nevada Block, 309 Montgomery Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 16th day of February, 1892, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on TUESDAY, the 8th day of March, 1892, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

CHAS. H. OSBORN, Secretary. Office, Room 56 Nevada Block, 309 Montgomery Street, San Francisco, California.

GRAY EAGLE MINING COMPANY.—LOCATION OF principal place of business, San Francisco, California. Location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of January, 1892, an assessment, No. 27, of Six (6) Cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room 11, No. 303 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of February, 1892, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 7th day of March, 1892, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

A. W. BARROWS, Secretary. Office, Room 11, No. 303 California Street, San Francisco, California.

DELINQUENT SALE NOTICE.

CALIFORNIA CREAMERY COMPANY.—LOCATION OF principal place of business, San Francisco, California, No. 111 Front Street. Location of works, Novato, Marin County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the second day of November, 1891, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No.	Cert.	Shares.	Amt.
Kaupf, Julius	3	80	\$24.00
Kaupf, Frank M.	4	80	24.00

Did in accordance with law, and an order of the Board of Directors, made on the 24 day of November, 1891, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at the office of the Company, 111 Front Street, San Francisco, on MONDAY, the 11th day of January, 1892, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with cost of advertising and expenses of sale. CHAS. MERSEFELDER, Secretary.

Office, No. 111 Front Street, San Francisco, California.

At a meeting of the Directors of the California Creamery Company, held to-day, the day of sale of the above delinquent assessment was postponed to MONDAY, February 1st, 1892, at two o'clock P. M., at the office of the Company 111 Front Street, San Francisco, California.

CHAS. MERSEFELDER, Secretary. San Francisco, Jan. 11, 1892.

RUPTURE, FILES and all Rectal Diseases POSITIVELY CURED, in from 30 to 60 days, WITHOUT OPERATION OR DETENTION FROM BUSINESS. Also ALL NERVOUS, SKIN, BLOOD, PRIVATE AND CHRONIC DISEASES OF BOTH SEXES. STRICTURE AND URINARY TROUBLES CURED. No charge unless cure is effected. Consultation free. Cal. or address for pamphlet, DR. PORTERFIELD & LOBEY, 839 Market St., San Francisco, Cal.

FRUE ORE CONCENTRATOR

OVER 8000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

Manufactured under Patents of April 27, 1880;

September 18, 1883; July 24, 1888;

and March 31, 1891.

Price of Plain Belt Frue Vanner, \$575, f. o. b.

Price of Improved Belt Frue Vanner, \$825, f. o. b.

Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

Advertisement for Proposals!
TUNNEL.

SEALED PROPOSALS WILL BE RECEIVED BY THE
Directors of the Bear Valley Irrigation Company at
Redlands, California, until March 1st, 1892, for the con-
struction of a Tunnel about 6800 feet in length through
rock, in accordance with the plans and specifications on
file in the office of the undersigned. Bidders may propose
to furnish their own plant, or to use a complete power-
drilling, hauling and ventilating plant to be furnished by
the Company. Each bid must be accompanied by a
certified check for not less than 2% of the amount of the
proposal. The Directors reserve the right to reject any
or all proposals. EDWARD M. BOGGS, Engineer,
Banning, California.

PELTON WATER MOTORS. Varying from the fraction of 1 up to 40 and 50-horse power, unequalled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. Address as above.

**THE GATES ORE AND ROCK BREAKER.**

UNLIMITED IN CAPACITY. UNEQUALLED IN EFFICIENCY. UPWARD OF 3,000 NOW IN USE. Will do more than twice the work of any other with the same cost in wear. Gives a fineness of product that increases the capacity of any mill from 25 to 40 per cent without any additional expense. THE BEST AND ONLY CRUSHER ADAPTED TO MACADAM ROAD WORK. Send for Circular.

THE PELTON WATER WHEEL CO. 121-123 Main Street San Francisco, General Western Agents.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Concentrating Belt manufactured in San Francisco; we can therefore fill all orders on short notice. The length and width of these belts are the same as is used on the Frue or Triumph Concentrating Machines, but can be made of any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inrolling toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth.

Mining Insulator and Clamping Ear.

The requirements of electrical appliances for use in mines has necessitated the production of a type varying considerably from those employed above ground, the condition in the former case being much more severe than in the latter.

The insulator and ear shown in the accompanying cut was designed for the use of the Thomson-Van Depoele Electric Mining Company, and is particularly suited to the purpose for which it was made.

The insulator body is of iron, thoroughly painted with Graphite paint, to withstand the action of the sulphuric acid in the mines, the insulator itself being made of pieces of porcelain, rubber or other suitable material, strong and large to withstand severe strains. Its construction is such that the insulation is entirely protected from blows of the trolley, should it leave the trolley wire, and at the same time little opportunity occurs for grounding, as the head of the hanger-bolt is embedded in the porcelain or rubber, and the only joint in the insulation filled by a soft rubber washer firmly forced into position when the trolley wire is screwed into place.

The only opportunity for surface leakage is on the under side of the insulator along the surface of the cone, and as this has been corrugated the liability of a leakage is reduced to a minimum.

The clamping trolley ear was designed by Mr. J. P. B. Fiske of the Thomson-Houston Electric Company, and is very easy to install as no soldering is necessary. Its security is greater than any soldered ear, as the wire cannot come down until the phosphor bronze clamp is worn through. Its life is almost indefinite, as the clamp is .032 inch thick and eight inches long.

As the clamp can be loosened in a moment's time, the slack in the wire can be taken up at a little expense of time and trouble, a feature not possessed by the soldered ear.

The excessive sparking which occurs with the other types of clamping ear is obviated by making the bronze very thin, so that it can be easily reduced to a knife edge at the end where the trolley runs on. The clamping devices being located at the end where the trolley runs on the phosphor bronze, the latter is sure to be pulled tight against the wire at this point, thereby securing a good fit and preventing sparking.

The clamping devices are positively locked by means of a stout German silver lock wire. It is not possible for the screw to hack out even the fraction of a turn, without shearing off this wire, which is quite improbable, as the shearing force is practically nothing. There can be no corrosion or rusting of the clamp-

INSULATOR FOR USE IN MINES.

THE IMPROVED KNIGHT WATER WHEEL.—See page 101.

ing ear, as in its construction iron and steel have been entirely eliminated. Should the bronze clamping strip wear out, a new one can be substituted at a moment's notice.

A Digester for Cleansing Ramie.

The accompanying cut represents an improved apparatus, invented by Mr. Walter T. Forbes, for the purpose of treating the ramie fiber, and preparing it ready for the spinner. The process employed by Mr. Forbes is a chemical one; the apparatus shown is employed to aid in carrying out his system of work.

The crude ramie is placed in the digester and subjected to the action of a chemical solution under heat. The pump forces the solution through the heater into the digester, thus diffusing it through the mass of material. This action dissolves the epidermis (or outer bark) and at the same time dissolves the resinous gums in which the fibre is incased.

After this treatment of the fibre, it is allowed to dry, and is ready for the market in its unbleached condition.

Mr. Forbes also has a chemical method for instantaneously bleaching the ramie fibre. He is now having this apparatus manufactured at the Union Iron Works in this city, and will in a few weeks have it in active operation.

When completed, tests will be made, and those interested in this industry in California will be invited to witness the operation of the process.

This apparatus is the first of the kind, of any size, ever made in the United States, and is intended to demonstrate, on a proper scale, the utility of the method. The process is not unlike that of the making of chemical pulp in a paper mill. The fiber is not injured while the ramie is degummed and the outer scale removed at the same operation.

DIGESTER FOR CLEANING RAMIE, HEMP AND JUTE.

THE IOWA HILL MINERAL CONTEST. — Some years ago, John B. Hohson filed a mineral claim in the U. S. Land Office at Sacramento, covering a portion of the town site of Iowa Hill, Placer county. His claim was rejected by the Land Office on the testimony of citizens of the town that the land claimed was more valuable for agricultural than mining purposes. After a long contest, it was taken to the Secretary of the Interior, who has finally decided that the testimony as to the agricultural character of the land has not been established, but on the contrary, it was shown to have value as to its mineral, and that Hohson was entitled to file upon the land for the purposes of mining.

A RICH LEDGE has been discovered on the head of Sardine creek, near Gold Hill, Oregon.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—ED.

The Glacial Period.

A Discussion of Mr. Manson's Theory. SAN FRANCISCO, Jan. 27, 1892.

TO THE EDITOR:—Mr. Marsden Manson has recently (Sept., 1891) published a paper in the proceedings of the Technical Society of the Pacific Coast, presenting a new theory to account for the quaternary ice age. His results are, in a few words, that the earth must necessarily pass through a glacial period just before the waning influence of the earth heat is succeeded by the influence of solar heat previously shut off by the heavy fogs and clouds generated by the warm oceans. The climate of earlier geological periods was solely determined by the terrestrial heat, only light rays—not heat rays—being able to penetrate the deep mantle of clouds and vapors surrounding the globe. The gradual cooling of the earth finally exhausted the internal source of heat, the oceans keeping warmer longer than the continents on account of the higher specific heat of water. Finally in the language of the author, the isothermal shell of 32° F. shrank to the surface of the earth and the moisture of the atmosphere began to condense and accumulated on the continents as snow and ice. When the oceans could no longer give off enough vapors, on account of being too cold, the sunlight burst through and the present climatic conditions were inaugurated.

I shall not attempt to discuss the theory; my intention is simply to show how contrary the results of the theory are to certain well established geological facts.

The conclusion to which the author arrives is that the whole globe has at one time been glaciated. He states so explicitly, and proceeds to affirm that this is in unison with geological results. If the testimony from certain parts of the world is not conclusive it is simply because of imperfect exploration and knowledge.

Now nothing could be further from the facts. It is well known that during the ice age of the quaternary era certain parts of Europe and North America were covered by a thick ice cap, just as Greenland still is at the present time. It is further perfectly well known that Southern Europe and a very large part of North America were not glaciated. In the Rocky Mountain region and the Great Basin the old glaciers did not extend lower than an elevation of about 8000 feet. In California the glaciers at a quite recent time reached down to about 4000 feet in the Sierra Nevada, but their extent was small compared to the not glaciated part of the State. Besides, the age of these glaciers compared to that of the great northeastern ice sheet is a question open to debate. Probably they were much later. The Southern States, Mexico, Central and South America, all these were not glaciated. A possible exception is Patagonia and the higher Andes, which probably at one time were covered with ice.

Southern India and Ceylon were not glaciated. Only in the Himalayas, as in the Sierras, the glaciers at one time reached down to 3000 or 4000 feet above the sea.

The Karroo plateaux of South Africa, Central and North Africa have not been glaciated in recent geological times, nor has Australia. New Zealand had, indeed, at one time much more extensive ice fields than at present; but a late authority argues on excellent evidence that the glacial period there was of earlier age than that of Europe, and that the climate did not materially differ from that of the present time.

The geological evidence is in favor of a former cooler climate of many parts of the globe, a former larger extension of glaciers in certain regions of high elevations, the existence of an ice cap on certain parts of the Northern Hemisphere; but it is most decidedly and positively against a universal quaternary glaciation of the globe. Nor is it at all certain that the glacial phenomena, where observed on the Southern Hemisphere, are contemporaneous with those on the Northern.

It has been remarked that the "interglacial periods" afford an excellent criterion for glacial theories. They certainly are in this case, the offhand explanation of them given by the author being utterly inefficient.

I would further like to call the attention of the author to the rapidly accumulating proofs of earlier glacial periods. In Great Britain and in Central Europe, in South Africa, India and Australia, and only very recently in Norway, there have been found abundant evidences of a *Permian or carboniferous* glaciation.*

*See, for instance, "American Geologist," May, '89, W. LINDGREN, U. S. Geol. Sur.

Locating Mining Claims.

LINCOLN, N. M., Jan. 22, 1892.

TO THE EDITOR:—I noted some time since in your journal a clipping from, I think, a Montana local paper purporting to contain the advice of an old prospector to a tenderfoot on the location of a claim. Having been a miner, and also engaged in the practice of mining law for many years, I feel authorized to criticize the scree. In one particular the advice was sound. A hard leadpencil and a soft board are the best materials out of which to construct a location notice for posting. The rest of the advice, including the form of location given, is entirely unsound. So far from making a location notice purposely as indefinite as possible, every reasonable effort should be made to make it as definite as the case admits of. The law requires that the notice contain "such a description of the claim * * * located, by reference to some natural object or permanent monument, as will identify the claim."

The last utterance of the U. S. Supreme Court on this point, in *Hammer vs. Garfield M. and M. Co.*, decided April 8, 1889 (9, Sup. Ct. Rep's., 548), gives this provision a liberal construction in the interest of the ordinary prospector, but by no means authorizes a disregard of the positive requirement of law, and a notice in which no description with reference to a natural object or permanent monument (liberally construed) is attempted, may safely be treated as void.

Any practitioner with experience in mining litigation is aware that a very large percentage of that litigation arises from the absence of such references and the indefiniteness of notices in other respects. In the records of my own county are several thousand notices of location, certainly one-half of which furnish no certain guide to the locality of the claim. Many of them supply no definite information further than that the claim is within a so-called mining district of indefinite boundaries and the size of an Eastern county; and a very large percentage of the most worthless of these are the production of "old prospectors." The tenderfoot, in some cases at least, seeks competent advice on the subject.

This subject is of more importance to the prospector than to anybody else, whether he be an old hand or one just entering the business. The prospector is always poor; under no circumstances does he ever get out of his prospect, however valuable, its real value. After a lifetime of hard work and hard fare, he usually "goes over the range" as poor as ever. If a dispute arises over his claim, leading to litigation, it is usually with an individual or corporation having over him every advantage which learning and wealth combined can give; and in too many cases he has himself laid the foundation and given away his case by proceedings precisely similar to those recommended by the "Old Prospector" quoted by the Montana paper and recopied in the PRESS. X. X. X. X.

A National Miners' Organization.

LINCOLN, N. M., Jan. 18, 1892.

TO THE EDITOR: I am glad to note the miners' movement in California, looking to a permanent State organization.

In this age of huge combinations, unorganized interests count for little. Now, when your State organization is perfected, why not propose a national miners' organization? The proposition will come with a better grace from California than from any other State or Territory, perhaps. Such a proposition emanating from a powerful and compact organization of the miners of California will receive prompt attention throughout the mining regions. The demands of a compact national organization will receive prompt attention from political parties and Congress. Such an organization, while of necessity strictly nonpolitical, will as necessarily foster a spirit of political independence. If the mining interests can be made thus independent; if the miners of the country can by organization be invigorated up to the point of declining to vote steadily against their own interests (as they have mostly done in the past), the great parties of the country will enter into a prompt competition in concessions to the interests of the mining industry. In the presence of such an organization, silver will not heg in vain as in the past for equal recognition as a money metal; nor will the hydraulic miner ask in vain for national recognition, and if necessary for national removal of obstacles to the prosecution of his industry. In the presence of such an organization courts and departments would not be swift as now to transfer the mineral domain of the United States to great corporations, or to so-called "agricultural claimants," usually in such cases work-

ing in the interests of corporations and monopolists behind the scenes. Let us have a national organization by all means. J.

Rolling Mill Development.

London *Iron*, under the above head, and in the article hereto appended, gives an interesting resume of this great industry, and in closing takes occasion to pay a very handsome compliment to American iron workers, acknowledging that they turn out much more work, in a given time, both in the rolling mill and in furnace work, than do the English:

"Necessity is the mother of invention" is a good old proverb, and like other proverbs it has a foundation of truth. But while many inventions have been suggested by some pressing need, others, and we should say the majority, have resulted from other causes. In one case it has been possibly a question of nothing more than rivalry, and in another case only a man's desire to approach perfection as nearly as he could. Out of something good he has been moved to endeavor to evolve something better. Indeed, we might almost say that, if every invention could be traced back to its origin, there is scarcely a phase in man's complex character which has not at one time or another been the source from which some invention has sprung. But science is not particular to inquire into original motives, and, given that the idea is good, does not trouble about the parentage. While, however, science, arts and industries do not neglect any invention that promises well, the latter-day public knows very little about the great majority of new discoveries.

The truth is that the brain of man is now so active, constantly scheming and contriving, and one invention succeeds another with so much rapidity that people grow blasé and cease to wonder. They have grown so accustomed to marvels of mechanical skill and power, and to intricate pieces of mechanism, that it requires the discoveries of an Edison, breaking comparatively new soil, to attract much attention. The public has been well schooled in the great fundamental—what we may call the classic—discoveries and inventions of the past, such as the law of gravitation, the steam engine, the stocking loom, the electric telegraph, and others; but it knows very little of the multitude of new contrivances and adaptations in which the last quarter of a century has been so prolific. Some of these, if they stood alone, would awaken as much admiration and wonder as any of the great discoveries of previous times; but we are fast losing our sense of wonder now, under the continual succession of fresh novelties.

It is not necessary to go beyond the range of the iron and steel industries to find many illustrations of what we have said. Sir Henry Bessemer's invention, of course, enjoys a world-wide fame, but there are many others of great utility and beauty which are comparatively unknown outside the circle of the trade. A paper by Mr. Hunt of Chicago, recently published, gives a rapid survey of what has been accomplished in one department, and will enable even a lay mind to comprehend the great extent to which mechanical means are employed nowadays, and made to do work which appears to require almost intelligence for its accomplishment. It is a far cry, for instance, from the early two-high nonreversing rolling mill to the three-high mill of the present day, with its automatic tables and contrivances, by which upward of 1500 tons of rails can be rolled in 24 hours. But it is the old story again of patient labor and gradual development, first one improvement being introduced and then another, until almost everything is done mechanically.

When we read that the number of men required to operate a rail mill has already been reduced from 15 or 17 to five, it does not appear altogether beyond the range of possibility that Holley's dream may one day come true, "when we would start a rail mill on Monday morning, and then go home after locking the doors, only returning each morning to count the rails that had been made during the preceding 24 hours, no other manual labor being necessary."

But the record of the development of the rolling mill and the manufacture of steel rails is not one of unimpeded progress. Prejudice and even ignorance have often striven to prevent the adoption of improvements even after they had been practically proved successful. Nowadays it seems incredible that the method of reducing the steel ingot into what is technically called a "bloom," by the slow and laborious process of hammering, should have held its ground for any length of time against the now universally adopted plan of reduction by roll-

ing. Not only was it so, however, but no little prejudice both in England and in America had to be overcome before the latter process was fully recognized.

The economy effected by doing away with the casting of the iron into pigs, which had afterward to be broken up and melted in the Bessemer converter, by the simple device of carrying the iron in a molten condition direct from the blast furnace to the converter, even now continues to meet with a certain amount of opposition, although it may be said to be almost universally adopted. In certain quarters a preference is professed for the old method involving the remelting, and certain engineers continue to stipulate for it in their specifications. All which only proves that no amount of opposition and prejudice can really stop an improvement being adopted, if it prove to be effective; although one man, prejudiced or ignorant, and placed in a certain position of power, may do much to retard the march of progress.

The question naturally arises—how do the results attained in the rolling mills of England compare with those accomplished in America? So far as we know, nothing has been done in this country at all approaching the "records" described by Mr. Hunt. An average English mill will turn out, according to circumstances, 1500 tons to 2000 tons weekly, and even more may on occasion be accomplished. But at the South Chicago works the great total of 8152 tons in one week has been reached.* Even making allowances for this being exceptional, and the result of a special effort, and a desire to "lick creation," there is no doubt that our American cousins get much more out of their rolling mills than our steel makers do out of theirs; just in the same way as Americans beat us in their blast furnace practice. What is just the precise reason for this, whether it is the result of the more extensive adoption of mechanical appliances, or because their plant is generally better than English plant, our technical readers must judge for themselves; but we trust they will not approach a consideration of the matter with the idea that nothing is to be learned from Cousin Jonathan. The condition of the iron trade in this country is not such that our manufacturers can afford to leave any stone unturned.

*From an item in the adjoining column, it will be noticed that at a recent special trial at the Edgar Thomson Steel Works, 1907 tons of rails were turned out in 24 hours.

The Mountain and Valley Committees.

The Conference at Sacramento.

The River Improvement Convention at its recent meeting authorized its executive committee to confer with the executive committee of the Miners' Convention if occasion offered, and the Miners' Convention duly authorized its committee to take similar action.

The following account of the conference is taken from the Sacramento *Record Union* of Jan. 29: On Tuesday of this week the miners' committee requested a conference, and one was held in the parlors of the Capital Hotel yesterday afternoon.

The miners were represented by J. H. Neff of San Francisco, R. G. Hart of Redding, J. B. Hohson of Auburn, J. K. Luttrell of Glen Ellen, and William Irelan and S. K. Thornton of San Francisco. The River Convention's committee was represented by Dr. G. M. Dixon, R. T. Devlin and E. J. Gregory of Sacramento, A. C. Bingham and Dr. C. E. Stone of Marysville, S. D. Woods of Stockton and William P. Edwards of Petaluma.

The meeting organized by electing Dr. G. M. Dixon, chairman and J. B. Hobson, secretary.

The avowed object of the conference was to fully harmonize the interests of the miners and valley people. Earnest addresses were made to this end by Messrs. Neff, Hobson, Luttrell, Thornton, Bingham, Woods and Stone.

The discussion resulted in the adoption of the following resolution, which was introduced by Mr. Devlin:

Resolved, That in all legislation before Congress for the improvement of rivers and creeks, and for the erection of dams and other restraining works, whereby hydraulic mining may be resumed, the committees sent by the River Improvement Convention and by the Miners' Convention, be requested to consult and confer with each other, in order that there may be unity of action, and that both committees will use their best efforts to secure favorable legislation for each appropriation recommended for the rivers and creeks, and for the objects recommended by the Biggs Commission.

The following resolution, introduced by Mr. Irelan, was also unanimously adopted:

Resolved, That all hydraulic miners be and they are hereby requested to obey the decrees of the courts, and cease all hydraulic mining wherever the same is calculated to do injury to the navigable

streams or valley lands, or wherever the debris shall be carried into the navigable streams.

The miners' delegation agreed that their executive committee would immediately issue a public address to the hydraulic miners of the State, requesting that that class of mining be immediately discontinued, and not be resumed until the Government has so far progressed with the works, according to the plans of the War Department engineers, as to insure the navigable streams and tributaries against further damage from mining debris, the understanding being that if any person shall undertake to prosecute hydraulic mining within the period indicated he will have no help or support from the body of miners whom the convention represented.

The result of this conference makes it almost certain that the various sums of money recommended by the Government engineers for the improvement of the rivers and the restraining of mining debris in the mountains will be appropriated by the present Congress, as now the delegations from both conventions will go to Washington on a common footing, to work for a common interest. As there is power in unity they should succeed.

The conference adjourned amid the mutual exchange of warm and hearty personal congratulations between the mining and valley representatives.

Niagara Falls and the World's Fair.

From a recent issue of the Chicago Herald we make the following quotation:

"A. P. Brayton Jr. Vice-President and Manager of the Pelton Water Wheel Co. of San Francisco, has presented a scheme to the World's Fair Managers which for boldness of conception is a surprise even to the progressive people of Chicago. It is nothing less than to harness the power of Niagara to Pelton wheels and send it over the wires to run the great Machinery Hall of the Exposition.

Mr. Brayton has been for some days in consultation with several of our most prominent electricians as well as the World's Fair Managers with reference to the suggestion above named. There is a substantial agreement among electricians—that in view of the great advance recently made in long distance transmission of power—the project is at least within the bounds of possibility. At a potential of 100,000 volts, it is claimed that 3000 h. p. can be delivered from Niagara to Chicago—500 miles—at a cost for wire of about \$500,000, the loss in transit being not more than 25 per cent.

If successfully accomplished, it is conceded that this would be the drawing card of the Exposition and the wonder of the century.

Mr. Brayton has another scheme on hand of equal importance and magnitude. Ferranti, the great English Electrician and Engineer, has a concession from the Canadian authorities for utilizing the power of Niagara on the Canadian side, which admits of the power station being located directly opposite the Falls, making unnecessary the long drain tunnel now under construction on the American side, by which means a plant of a given capacity can be installed for less than one-half the outlay required in the case above mentioned.

This enterprise has dragged somewhat on account of the disturbed condition of English finances during the past year from which source, capital was to be furnished to carry it through. Mr. Brayton has succeeded in enlisting the interest of some of our most prominent capitalists in this undertaking and he leaves with them to-night for a trip to Niagara to make a survey of the proposed site as also to confer, by appointment, with some of the Canadian authorities with reference to the matter. This enterprise is regarded as the most promising power scheme the country affords, considering the large developments that can be made with a comparatively small outlay.

The power will be furnished by Pelton wheels located in an underground station, 140 feet below the surface, water being carried to them by lateral canals and from thence to the station by vertical steel tubes. After having passed over the wheels, it is then discharged into the river below the Falls. The wheels will be of capacity of 4000 to 5000 h. p. each and will be attached to the shafts of the generators direct without gearing. In addition to supplying local demands for power, it is proposed to run wires to Buffalo and transmit 20,000 h. p. to that city.

EARTH CURRENTS.—The earth currents consequent upon operating the electric railroads in the southern portion of London seriously affect the working of the magnetic instruments in the Greenwich Observatory, although that institution is miles away from the lines of those railroads.

The California Miners' Association.

Officers, Committees and Constitution and By-Laws of the State Organization.

As the natural outgrowth of the State Mining Convention, and in accordance with the resolutions of that body, the California Miners' Association has been organized. The officers of the Association are as follows:

HON. J. H. NEFF..... President.
W. C. RALSTON..... Secretary.
THOS. B. EVERETT..... Asst. Secretary.
H. PICHOR..... Treasurer.

VICE-PRESIDENTS.

NAME.	COUNTY.
R. F. Grigsby.....	Napa
Henry Martin.....	Trinity
Geo. W. Thomas.....	Marin
Frank R. Wehe.....	Sierra
Woolston Baughart.....	San Mateo
R. H. Campbell.....	Siskiyou
A. B. Brien.....	Yuba
Frank Fitzgerald.....	Yuba
A. B. Call.....	Amador
Dixon Brabban.....	Plumas
J. F. Ryan.....	Humboldt
Aaron Bell.....	Shasta
H. O. Harvey.....	Sacramento
D. K. Perkins.....	Butte
A. M. Hurdle.....	San Luis Obispo
A. Tregidgo.....	Nevada
Ex-Gov. H. G. Blaisdell.....	Alameda
T. B. Morse.....	Calaveras
Hon. A. M. Clark.....	Fresno
J. K. Luttrell.....	Sonoma
J. Crawford.....	El Dorado
R. M. Folger.....	Mono
Geo. F. Hoyte.....	Orange
R. McMurray.....	San Francisco
H. S. Chapman.....	San Francisco
I. C. Stump.....	San Francisco
B. T. Lacy.....	San Francisco
A. J. Ralston.....	San Francisco
John W. Maxwell.....	Tuolumne
Hon. R. Clark.....	Colusa
C. F. Reed.....	Placer
Chas. Bogan.....	Mariposa
James H. Lawrence.....	Merced

EXECUTIVE COMMITTEE.

Hon. J. H. Neff, Placer.	H. A. McCrany, Lake.
Louis Glass, San Francisco.	Jas. Tunstead, Marin.
Col. Dan M. Burns, S. F.	A. M. Bryant, Mono.
Col. F. McLaughlin, Butte.	W. K. Alderley, Napa.
S. K. Thornton, S. F.	Chas. Bogan, Mariposa.
Wm. Irelan Jr., S. F.	Jas. H. Lawrence, Merced.
Hon. O. W. Cross, Nevada.	Hon. J. M. Walling, Nevada.
Chas. O. Yale, San Francisco.	D. C. Pixley, Orange.
J. B. Hobson, Placer.	Myron Angel, S. L. Obispo.
Hon. Edw. Coleman, Nevada.	W. W. Kellogg, Plumas.
Hon. A. Walrath, S. F.	M. M. Drew, Sacramento.
Hon. J. K. Luttrell, Sonoma.	Thos. R. Church, S. F.
Ex-Gov. H. G. Blaisdell, Ala.	John Hays Hammond, S. F.
Hon. Jno. Daggett, Siskiyou.	Myron Angel, S. L. Obispo.
Hon. E. O. Voorheis, Amador.	N. J. Brittan, San Mateo.
E. W. Fogg, Butte.	George M. Pincey, Sierra.
Hon. F. Davis, Calaveras.	R. G. Hart, Shasta.
S. B. Boggs, Colusa.	A. W. Dana, Sonoma.
Hon. Thos. Fraser, El Dorado.	A. Howell, Stanislaus.
Mr. McDonald, Fresno.	C. P. Berry, Sutter.
W. H. Pratt, Humboldt.	C. McNamara, Tuolumne.
Hon. Patrick Eaddy, Inyo.	G. O. Kimball, Tehama.
J. O. Miller, Kern.	John McMurray, Trinity.
	O. G. Mayo, Yuba.

FINANCE COMMITTEE.

Louis Glass, San Francisco	Edward Coleman, Grass Valley.
Wm. Irelan Jr., S. F.	S. K. Thornton, S. F.
N. J. Brittan, San Mateo.	John Hays Hammond S. F.

COMMITTEE TO FORMULATE AND PROMOTE THE ADOPTION OF AMENDMENTS TO MINING STATUTES.

Hon. Niles Searles, of Nevada.	J. M. Fulweller, Placer.
Hon. O. W. Cross, S. F.	H. I. Thornton, S. F.
	Hon. J. K. Luttrell, Sonoma.

COMMITTEE OF CONFERENCE WITH RIVER AND HARBOR CONVENTION COMMITTEE.

R. G. Hart, Shasta.	Wm. Irelan Jr., S. F.
Frank McLaughlin, Butte.	J. B. Hobson, Placer.
Hon. J. K. Luttrell, Sonoma.	

DELEGATES TO WASHINGTON.

Hon. Niles Searles, of Nevada County.
Hon. J. K. Luttrell, of Sonoma County.
Robert McMurray, of Nevada County.
J. B. Hobson, of Placer County.

The headquarters of the California Miners' Association have been established at room 23, No. 331 Pine St., S. F. Stock Exchange Building.

THE CONSTITUTION.

ARTICLE I.

SECTION 1. This organization shall be known as the California Miners' Association.

SEC. 2. The objects of this Association shall be to protect, develop and foster the mining industry of the State of California in all its branches.

ARTICLE II.

SECTION 1. The officers of this organization shall be a President, Vice-President, Secretary, Assistant Secretary, Treasurer, and an Executive Committee, consisting of eleven members selected at large, and one additional from each county represented in the Association, to be selected by the President of this Association.

SEC. 2. All officers to serve for the period of one year, or until their successors are elected or appointed.

SEC. 3. The President and Secretary of the Association shall be *ex officio* President and Secretary of the Executive Committee.

SEC. 4. There shall be an annual meeting of this Association held in San Francisco on the second Monday in October in each year.

ARTICLE III.

SECTION 1. The Executive Committee of this Association shall have full power to transact all business of the Association, except such as may be transacted at any General Meeting of the Association.

SEC. 2. The President shall preside at all meetings of the Association, sign all drafts and checks authorized to be drawn on the Treasurer, and perform such other duties as are herein prescribed, as usually pertain to that office. In the absence of the President, a Vice-President shall perform the duties of that office, taking precedence in the order of their appointment, unless otherwise ordered by the Association.

SEC. 3. It shall be the duty of the Secretary to keep full and correct minutes of all meetings of this Association, and of the Executive Committee, and shall render annually to the Association a full report of all the transactions of his office; receive all moneys of the Association, paying the same to the Treasurer and taking his receipts therefor, and perform such other duties as may be required of him; either by the Association or the Executive Committee thereof. The Secretary shall give bonds in such sum as the Executive Committee may determine, for the faithful performance of his duties, such bond to be approved by the President.

SEC. 4. It shall be the duty of the Treasurer to receive all moneys of the Association, and safely keep the same, and pay the same only upon orders drawn by the Presi-

dent and countersigned by the Secretary. He shall render an annual report to the Association, and upon the request of the President of the Executive Committee, shall, at any time, furnish to said committee, a statement of the condition of the funds of the Association. The Treasurer shall give bonds in such sum as the Executive Committee may determine, for the faithful performance of his duties, such bond to be approved by the President.

ARTICLE IV.

SECTION 1. The headquarters of this Association shall be at the city and county of San Francisco.

SEC. 2. It shall be the duty of the Vice-Presidents of this Association to act once upon the formation of a County Organization in their respective counties. Such County Organizations shall be recognized as branches of this Association.

SEC. 3. All persons friendly to the mining interests are eligible to become members of this Association. In the event that there is no County Organization, such person may unite with the State Association by forwarding his name to the Secretary, therefor, and paying a membership fee of one dollar (\$1.00), upon which he shall be furnished by the Secretary with a certificate of membership. But this shall not constitute him a delegate to the meetings of the Association. County Organizations may admit nonresidents as members.

SEC. 4. Each County Organization shall be entitled to one delegate to the State Conventions for each ten members, to be selected by such County Organization may determine.

This Constitution may be amended at any General Meeting of the Association upon a vote of the majority of delegates present.

Adopted by the Executive Committee, Jan. 22, 1892.

BY-LAWS.

SECTION I.—The Executive Committee shall be authorized to appoint from among themselves such subcommittees as they may determine. They shall fill all vacancies of the officers of the Association or members of any committee. The Executive Committee shall have power to remove any officer of this Association who is derelict in his duty, upon a two-thirds vote of all the members present at such meeting, provided that no officer shall be removed until he shall have been notified of the intended action of the committee, and afforded an opportunity to be heard.

SEC. II.—The Executive Committee may, from time to time, levy such assessments upon county organizations as the necessities of this Association may require. Any county organization delinquent at the time of the annual meeting, on account of any assessments levied 90 days preceding such date, may be deprived of representation.

SEC. III.—All parliamentary questions shall be determined in accordance with Cushing's Manual, unless otherwise ordered by the Association.

SEC. IV.—Unless otherwise ordered, the President shall appoint all committees of this Association.

SEC. V.—The meetings of the Executive Committee shall be held at such times as they may determine. Special meetings of said committee may be called by the President whenever deemed advisable, and upon the written request of any five members of the Executive Committee the President shall call a meeting thereof.

SEC. VI.—At all meetings of the Executive Committee seven members shall constitute a quorum for the transaction of business. Whenever practicable, each member of the committee shall be notified personally or by mail of each intended meeting.

SEC. VII.—The Secretary and Treasurer shall receive such compensation for their services as the Executive Committee may from time to time determine.

These by-laws may be amended at any annual meeting of the Association, upon a vote of the majority of delegates present.

Adopted by the Executive Committee Jan. 22d, 1892.

Mineral on a Government Reservation.

The Mining Ground in the Yosemite National Park.

The following is the resolution introduced in the State Mining Convention by James H. Lawrence, of Merced county, and referred by the Committee on Resolutions to the Executive Committee of the California Miners' Association:

By an act of Congress, approved October 1, 1890, a reservation of a tract of land embracing within its limits 42 townships was set apart for park purposes. It is known in official reports and on the maps as the Yosemite National Park, and its territory extends from and including township 2 north, range 19 east, southerly to the south west corner of township 4 south, Mount Diablo base and meridian, and from that point runs easterly to and including townships 3 and 4 in range 26. Altogether in round numbers its area amounts to 1512 square miles or 967,000 acres, less 36,111 acres known as the Yosemite grant, which is owned by the State of California. It is located within the boundaries of the counties of Fresno, Mariposa and Tuolumne. The southwest corner of this park is within five miles of the town of Mariposa, the county seat of that county.

Without taking into account the fact that it includes within its scope mountain ranches which have been occupied and cultivated for more than 40 years, and is a barrier against projected public highways and other improvements, it may be safely asserted that more than one-third of this vast area is known to be mineral in character. Of this over five townships, aggregating more than 100,000 acres, are located within Mariposa county, in the gold mining belt of the foothills, and embrace many mines which in years past yielded immense returns, and whose prospective value can only be approximately estimated.

That portion of the park located within the limits of Fresno county includes the Minarets and North Fork district, tributary to the San Joaquin, a rich mineral country only partially developed. Under cover of a pretended purpose of protecting the timber and watersheds of the streams tributary to Yosemite valley, and through the misstatements of irresponsible parties who represented that the entire territory was

unoccupied, uninhabitable and valueless a grievous wrong was inflicted upon the people of the counties named and a damaging blow struck at the mining industry of the State.

Wherefore do we who represent the mining interests of the State of California in convention assembled urge upon our Representatives and Senators in Congress the necessity of an amendment to the act in question, changing the boundaries of the Yosemite National Park, excluding from its territorial jurisdiction all lands known to be mineral in character, to the end that mining may be carried on in conformity with the laws and usages of mining districts, the statutes of the United States and the settled policy of our Federal Government.

Desist from Illegal Mining!

The Request of the State Association.

The Executive Committee of the California Miners' Association has adopted the following resolutions, which will be sent, in circular form, throughout the hydraulic mining regions of the State:

Resolved, That all hydraulic miners in California who may have been at work contrary to the decrees of the courts, if such there be, are hereby urgently requested by the California Miners' Association to desist at once from such operations and wait patiently until Congress is enabled to act upon the report of the Government Commission, which was appointed to inquire into the debris question in California.

Resolved, That it is the desire of the California Miners' Association, as far as hydraulic mining is concerned, to use every effort toward rehabilitating that industry on a legal basis; but that these efforts will be hadly hampered and the former contest be apt to be resumed if individual miners do not accept the policy of the Association.

Resolved, That it is the sense of the California Miners' Association that such persons as may start their monitors in the spring, at places where damage is likely to result to streams or adjacent lands, shall receive no aid or countenance in the future from this Association.

Resolved, That copies of the memorial and resolutions adopted by the State Miners' Convention be distributed throughout the mining regions of California, and that the miners be requested to read them carefully in order that they may fully understand the pledges of the Convention and the Association. Said miners are thereupon urgently requested to respect the opinions therein expressed, and to otherwise aid this Association in rehabilitating the hydraulic mining industry in this State.

Resolved, That we emphatically endorse the resolution adopted at the joint conference on Jan. 28th of representatives of the River Improvement Convention and the Miners' Convention, as follows:

Resolved, That all hydraulic miners be, and they are hereby requested to obey the decrees of the courts, and cease all hydraulic mining wherever the same is calculated to do injury to the navigable streams or valley lands, or wherever the debris shall be carried into the navigable streams.

The Mining Bureau Museum.

Recent additions to the collections of the State Mining Bureau are as follows:

Fossils, donated by Miss M. Hearn, Yreka, Cal.
Stannolite, Switzerland, Williamsburgh Scientific Society.
Manganese ore of good quality, from a large body at the Radovich mine, Stanislaus Co., L. Radovich.
Agate, cut and polished, Suisun, Solano Co., Geo. H. Suhren.
Selenite (French chalk), Hazel Creek, Shasta Co., Thos. N. Jones.
Rutile in granite, Humboldt Co., Cal. First time this mineral has been collected in California. F. McGowan.
Gold in crystallized quartz, Delhi mine, Nevada Co., Cal., R. McMurray.
Cinnabar in Pyrolusite, Stony Ford, Colusa Co., T. O. Schuch.
Fifteen specimens crystallized minerals from Europe. Exchange.
Nine specimens from New Jersey. Exchange.
Five specimens from Mexico. Exchange.
Thirteen specimens silver, tin and other ores from Peru and Bolivia. Exchange.
Selenite "phantom crystals," Ohio, and fragment of melonite, N. Y., Mr. Brayerman.
Fluorite. The first good specimen noted in California. Felix mine, Los Angeles Co. W. H. Adams, Jr.
Lead ore, Orange Co., gold quartz and silver ore, Alaska, Thos. Donland.
Fine ammonites and other fossils, R. Petersen, Sites, Colusa Co., Cal.
Fossils from Tuscan Springs and the Marysville Buttes.
Fine specimens of gold, cinnabar, copper, argonite, etc., etc., Sulphur Creek, Colusa Co. Presented by the Colusa Horticultural Society.
Twenty-five specimens of gold quartz from as many mines, representing Ophir district, Placer Co., Dr. M. Schuch.
Sandstone of excellent quality from quarry near Sites, Colusa Co.
Garnets from near California City, Marin Co.
Gypsum of excellent quality from a large deposit 12 miles east from Mojave, Kern Co., Cal., S. P. Maslin.

THE LONG POLAR NIGHT is to be made glorious day hereafter in Hammerfest, Norway, the most northern settlement of Europe, a village of some two or three thousand inhabitants, by the use of the electric light, which has recently been introduced into every house in the town. Three swiftly running streams, in the near vicinity, furnish the power through which the light is produced. The streams are simply torrents, the waters of which run so swiftly that they never freeze even in that arctic winter. Outdoor work there can be very readily performed by the reflected light of the sun, which sinks but a few degrees below the horizon. Artificial light is needed within doors only.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Butte.

JOURDAN HILL.—Oroville Register, Jan. 28: From parties down to-day from the Jourdan Hill mines we learn that seven men are employed on the Rainbow mine. They are engaged in cleaning and pumping out the incline which is about 150 feet deep. When this is finished, additional men will be employed and a tunnel will be run so as to take out a few tons of quartz, which will be crushed. If the rock pays satisfactorily, then it is stated a tunnel will be run from the East Branch side of the hill so as to strike the lode at a distance of 300 feet from the surface. There is a five stamp mill now on the mine and this will be increased if the ore proves as rich as is anticipated. There are some 15 or 16 men now at Jourdan Hill prospecting and looking for quartz.

OREGON CITY MINES.—Many years ago, when quartz mining was in its pristine glory in Butte, the Oregon City mines were among the richest in the State. Fabulous sums were taken from them and it was confidently asserted that if better and stronger pumping machinery had been placed upon them, so as to keep down the water, these mines would have been worked for many years. Now they are being opened by a large company, and it is thought they will pay excellently. On Saturday, the following parties, who are interested in these mines, came up from Woodland: H. C. Gable, J. F. Fink, A. Barney and Wm. Goeggel, and on Sunday, in company with E. McGrath, A. T. Graner, J. N. Friesleben and E. P. Farnham, all of whom are stockholders in the mines, visited Oregon City and inspected the work that has been done. It is reported that they were highly pleased with the work so far, and believe they have a bonanza in the property they own at that place.

El Dorado.

GRAVEL.—El Dorado Republican, Jan. 30: A fine bed of gravel from three to four feet deep has been developed in the Blair mine from which good prospects are obtained. A cannon-ball mill is now being set up on the ground to work the gravel, which is hard enough to require a milling process of some kind.

ELECTRIC PUMPS.—The Idlewild Co., operating the Taylor mine near Garden Valley, is putting in electrical pumps, lights and drills. This mine appears to be worked very successfully, and some recent reports announce very profitable results from the mill.

SHAW.—The mining outlook is good. The owners of the Shaw mine have just put in some new concentrators. The little mill has been running steadily for the past month or six weeks. The proceeds have been ample to pay all expenses, put in the new concentrators, etc.

CHURCH.—The success of the Church mine is an assured and permanent industry, and a standing evidence of the vast wealth of our quartz leads in this locality. Mr. Wm. Shaw, Sr., and Fred Hamill are running a drift in their mine, situated on Dry creek, immediately west of town. The rock in their drift is exceedingly hard, but they pan out good wages nevertheless.

Humboldt.

WILLOW CREEK GOLD.—Cor. Arcata Union, Jan. 23: But few people are aware of the change on Willow creek during 1891. Six months ago but one man was mining on the creek and few had any idea that gold was present in paying quantities. To-day about 40 claims are located on the creek. Many of these claims have good substantial cabins, and good prospects have been found on all. The gold is coarse and heavy and the water is abundant at every period of the year, and can be easily and cheaply carried wherever desired. Wonders have been done in a few months, when we consider the difficulties to be overcome. New trails have been made, cabins have been built, lumber for boxes carried in by hand or split from cedar, which is found here in abundance. Gold has already been sold from the following mines: The Bagley, Golden Dawn, Deer Lick, Helen, Soule, Curran and the Rebecca, some of the sales running up into the hundreds. Work on the Cora, the Eliza Jane and Larinia will begin at once. The Leland and the Golden Chance prospect finely and work will soon begin on them. As soon as spring opens the creek will be a scene of busy activity for nearly 15 miles. The climate is mild; timber of all kinds is abundant. The indications for gold and silver bearing quartz are unmistakable. The sale of the Willow creek mines on the Trinity is now an accomplished fact, and the mines on Willow creek itself will be the next objective point for mining capitalists. The mines are easily accessible, many of them being within one or two miles of the county road. Next summer will undoubtedly see a large number of men here.

Napa.

PALISADE SILVER MINE.—Calistogan, Jan. 27: The shaft of the Palisade silver mine is completed to its full depth—275 feet, with a 25-foot sump in addition, or 300 feet in all. Two weeks or more will be required to put the shaft in order for the running of the cage, and then drifting from the bottom of the shaft toward the ore vein will begin. The drift will have to be 100 feet in length through very hard rock, and considerable time will be necessary to complete it. The shaft has been deepened with the aid of three shifts of miners working eight hours each, but the drift will be made with only day and night shifts.

KNAPP CONS.—The lower tunnel of the Knapp Consolidated silver mine in Horn canyon was extended only 3½ feet with steady work, night and day, the whole of last week, which is the slowest progress we have known to be made in the district. This was true on account of the extreme hardness of the rock. The tunnel has been advanced to a distance of about 270 feet. The cost per foot last week was fully \$22, which is very costly for tunnel work. The blasting done there lately has been very heavy, and though 260 feet from the mouth of the tunnel, under ground and almost three miles from town, windows here have been slightly shaken, as we noticed particularly Saturday evening last.

QUICKSILVER.—The tunnel of the quicksilver claim owned by Jas. Teale and Jas. Simmons, in

the hills north of town, has been advanced a distance of 63 feet. Twenty feet more will have to be run before reaching the point where it is expected cinnabar will be found. The prospects are remarkably good for finding it. If the 20 feet develops cinnabar, as is expected, parties are ready to purchase the claim and engage in work there extensively. Some very rich cinnabar has been taken out of the claim. Labor in the tunnel of the Sunnyside silver claim, easterly from town, has been suspended the past ten days on account of sickness of miners engaged in the work. Work in the Black Bear mine, Pine Flat district, has been suspended, but only temporarily. The Chinese working force at the Napa Consolidated quicksilver mine has been greatly reduced since the destruction of their camp there a week ago. The Chinamen have scattered here and there, a majority of them going to San Francisco. The camp is to be rebuilt as soon as possible, and its location changed to the "new mine." The present output at the furnaces will not be reduced, as there is reserve ore sufficient to keep them going for a month. By that time the camp will be rebuilt probably, and the miners will have returned. Fifteen tons of machinery, received at Calistoga by rail, are being delivered at the Great Western quicksilver mine this week by Spiers' freight teams. The shipment embraced an engine, boiler, air-compressor, etc.

HUNT'S HILL MINES.—Nevada Transcript, Jan. 27: The Eastern and Maine mine, owned by A. G. Turner, is located at Hunt's Hill, on Greenhorn creek, six miles southeast of Nevada City. It lies in the great blue lead channel, and for years prior to the antidebris decision was a paying mine. It yielded during those years over \$600,000 and large dividends; to-day it lies idle because the motive power of capital is lacking. Acres of good paying drift gravel are there and have never been disturbed, save by a few prospecting tunnels, which have shown good prospects. A small part of the ground was drifted in the early mining days, but people were not content then with small profits, as nothing but extraordinary rich deposits were desired. The mine adjoining Mr. Turner's claim is owned by a gang of Chinamen, who are drifting it on an extensive scale. From good authority it is known that the mine has yielded about \$100,000 since 1883. Adjoining the Eastern and Maine mine on the south is the Jenny Lind, owned by M. L. Marsb of Nevada City. This mine has been idle for a number of years, but should hydraulic mining be resorted to it would probably be worked on an extensive scale.

Nevada.

THE ODIN.—Transcript, Jan. 30: One of the most important mining enterprises in this district is the Odin, a mile north of the city. The claim embraces the old Nebraska ground which was patented by the Woodville Company. In the fifties and sixties a small portion of the ground was drifted and yielded close to \$700,000. Last year Captain Harry Seymour, one of the oldest and best gravel miners in the State and formerly superintendent of this mine, organized a strong company of Nevada City and San Francisco men, and being elected president and general manager, commenced on September 7th the task of opening the claim in a systematic manner. Two inclines were started within 12 feet of each other—one in an easterly direction to tap the main channel at a distance of 465 feet, the other going southerly toward a branch channel or ravine 264 feet distant. The perpendicular depth of the main channel from the surface is 197 feet, of the branch 175 feet, as shown by former workings. The long incline is ten feet wide, and has three compartments, the other eight feet with two compartments. These inclines were put down 70 feet by hand and then the inflow of water stopped farther sinking. Subsequently a drain tunnel has been run 350 feet and passes under the present bottom of the inclines at a perpendicular depth from the surface of 70 feet. Under the capable supervision of Captain George A. Nibell, a building has been erected over the mounds of the inclines and supplied with a first-class plant of machinery, which includes a powerful hoist and a pump for each incline. The motive power is a five-foot Pelton wheel, run by water brought in by the Central House ditch, with 1200 feet of pipe and having 400 feet of fall. The incline leading to the branch channel will be put down first, nine men in eight hour shifts being employed. It will take about 40 days to reach bedrock and then sinking for the main deposit will begin. Captain Seymour calculates that the total expense of opening up both parts of the mine will be less than \$12,000. The Odin stockholders are not at all unreasonable in figuring upon a clear profit of at least \$75,000 from their investment, as there is, in the opinion of many familiar with the ground, a strong probability that they will reap a much larger sum.

THE FEDERAL LOAN.—At the Federal Loan work is being prosecuted vigorously on the 100, 300 and 400 levels, and much good ore is being taken out. Next spring, as soon as the road is open to heavy wagons, a powerful new pump will be put in and the sinking of the shaft will be resumed.

BONDED ANOTHER CLAIM.—The Knickerbocker gravel claim, just west of the Hirsman diggings continues to pay well and the owners have bonded the Grover & Murphy claim, which adjoins the Knickerbocker on the east.

WILL REOPEN THE DRAIN TUNNEL.—This week will be commenced the work of reopening the drain tunnel that was run some years ago to drain the Nevada City mine. It is about a mile in length and extends from the Wyoming mill to the western end of the Nevada City mine, and taps the ledge of the Nevada City at a depth of 500 feet. The tunnel has not been in use for some time, and is caved together in places.

CRUSHING FROM THE MERRIMAC.—Grass Valley Union, Feb. 2: A crushing of quartz from the Merrimac mine, just made at the Peabody mill, gave a return of \$21 a'load. This was taken from the vein through the drain tunnel, which is being reopened. This vein is showing a width of over 12 inches, and the quartz all looks as of a fair quality for milling. The prospects are considered very encouraging, and give strong hopes for the future of the mine when the old shaft is reopened down to the bottom of the former workings.

THE PROVIDENCE.—Nevada Transcript, Feb. 1: This morning the mill of the Providence mine was started up with 15 stamps. This will be good news to our people. The mill will now be run continuously, and as the ore taken out increases, more of the stamps will be utilized. As soon as possible,

the force of men will be increased, and, it is believed, in a few weeks as large a gang of men will be employed under ground as at any previous time. Carl Davis, one of the best mining men in the county, is the superintendent and has plenty of capital at his back to open up the Old Reliable in good shape. Mr. Davis is of the opinion that in a few months the mine will again be the leading one in this district.

IDAHO DIVIDEND.—Grass Valley Telegraph, Feb. 2: On Monday evening the directors of the Idaho Mining Co. declared a dividend of \$1 per share on the capital stock. This makes 260 dividends declared by the company. The mine is looking well throughout and is destined for a long life yet.

BLUE BELL.—The Blue Bell quartz mine, near Washington, in the upper part of this county, is now looking exceptionally well. Mr. Tregidgo received a letter to-day from his parties in charge at the mine, and the letter stated that they are drifting south on the 300 level and that the 100 and 200 levels are all being worked and are showing well. The 300 level is expected to show out some fine quartz before many days.

THE VULCAN.—The Vulcan mine has been leased by John Riley and company. The claim is leased for one year and work on the bottom ledge is now being done.

LIVELY PROSPECTING.—Grass Valley Telegraph, Jan. 27: Just now about as lively a prospecting camp as can be found is in and about Rough and Ready. There are innumerable quartz ledges around that place and it is a true saying that "you can hardly strike a pick anywhere there but that you find gold." Since the bonding of the Osceola and the recent rich rock which has been taken therefrom a spirit of energy has reached the populace, and now prospecting for quartz is going on actively. There is no reason why a good mine should not be found down there as well as anywhere else. The surface diggings around Rough and Ready were exceptionally rich in the early days, and much "quartz-gold" was found in those claims.

THE CHAMPION.—Grass Valley Telegraph, Jan. 28: W. S. May, the millwright, is just now figuring on improvements soon to be made at the Champion mine at Nevada City. New mortars will be put in, the machinery will receive a general overhauling and in all probability a new mill will be built. The mill now on the property is 15 stamps and is doing excellent work, but the recent developments at the mine are so flattering that a larger and better mill will be required. The ore from the Champion is very rich and there is plenty of it.

Plumas.

BRIGHTER OUTLOOK.—Plumas Co. Bulletin, Jan. 28: A brighter day is dawning for Plumas. In many parts of the county are evidences of renewed activity in business circles. The Genesee, Greenville and Crescent mines are attracting much attention, and the quartz interests west of Quincy are brightening the hopes of the people in this part of the country. About La Porte and Gibsonville, the outlook is much improved, while the country about Johnsonville will be the theatre of much activity next spring. The country in the vicinity of Buck's ranch and Granite Basin also is coming into notice. On the whole, the business situation is much improved.

MINE SOLD.—A. G. Swan, of Indian Valley, and Mr. Waldon of Granite Basin, were in Quincy Tuesday, completing the transfer of the mining property known as the Homestake and Siebert mine, situated in Granite Basin. Messrs. Waldron & Hubbard are the purchasers. During the past few months, they have had a bond of the property, with the privilege of doing such prospect and development work as they desired. The ore vein is small, being only a foot wide, but fully 200 feet of a chimney has been opened up, more than enough in sight to yield the purchase price of the mine. The ore is of high grade. The purchasers have thoroughly tested it by different processes of working, and we are assured by the former owner that it will yield between \$30 to \$40 per ton.

LA PORTE.—Plumas Co. Bulletin, Jan. 28: From J. D. McLaughlin, who is over from La Porte, we learn that there is considerable mining activity at Brown's Hill about four miles from Cascade and just inside the limits of Plumas county. Several Butte county parties have been prosecuting work on a quartz vein there, and lately they made a rich development. They now have a lode four feet wide, and it is said to be rich. It can be tapped about 600 feet deep.

PAYING.—In the same vicinity as the Brown's Hill quartz mine, is the McLaughlin drift mine, which is reported to be quite rich; now paying, under adverse circumstances in the method of operating it, \$75 per day to the man.

SAMPLE.—Development work on the Sample drift mine, at Yankee Hill, continues. This property is situated in Plumas, between St. Louis and La Porte. It is considered a good claim, and the owners are supposed to be obtaining good results from their labor.

THISTLE.—At Thistle shaft, about 80 men are employed, in and about the mine. The drift from the shaft is now in the mountain 1400 feet, and the gravel is reputed to be very rich, paying \$5-50 to the car load. It is claimed that the miners can see gold in the gravel. C. B. Wingate is superintendent of the mine, and F. A. Courley, foreman. There is some talk of starting a tunnel, next spring, in Wallace's Ravine. This would have to be run about one mile. By it, all of the Gibsonville ridge above Thistle Shaft, could be opened up. A rich Scotch company owns the Thistle mine. The presumption is that it will operate on a large scale in the near future.

A LONG TUNNEL.—The Claybank drift mine, just above La Porte, is owned by a Chicago company, which has been prosecuting development work during the past four years. The tunnel is in about one mile. A short time since a contract was let to drive another thousand feet of tunnel, which, it is thought, will tap the channel of the Gibsonville ridge lower down than Thistle Shaft.

The Riffe company is operating its mine, which is situated between St. Louis and Port Wine. They employ 12 men and are taking out money.

Several hydraulic mines in the vicinity of La Porte will operate as soon as the water season permits. They are so located that they can take care of their debris.

CRESCENT.—Plumas National, Jan. 30: Supt. Whitney of the Crescent mine, says drifts are being run at the bottom of the 400-foot shaft, north and

south, to strike the Pet and Horseshoe veins. The rock is very hard. From the 200-foot level a tunnel is being driven ahead to tap the Crescent lode. They are in some 70 feet at the bottom of the 400-foot shaft each way.

San Diego.

HELYETIA.—Julian Sentinel, Jan. 28: During the past month little has been said of the Helyetia, but this valuable property has been steadily improving and is now considered one of the best in camp. A visit to this mine one day last week, disclosed some facts not heretofore known to the outside world. How to get a sufficient water supply at first seemed a difficulty; but one that was easily overcome, and the mill is running day and night. A tank was placed just outside the mill and the water is caught and forced back into the tanks above and used again. In this manner a plentiful supply is always on hand. Not long ago the old workings of this mine were reached and a valuable body of ore of considerable extent encountered. Some 20 men are working day and night and the ore is coming up the shaft as fast as the mill can crush it. The ore averages from \$17 to \$40 per ton, most of it coming from the stopes. Among other improvements is a new 70 horse power boiler now on the road, which will furnish steam enough to run the mill and pumps, independent of the other boiler.

BANNER.—The Banner Mining and Milling Co. is working in some nice rock in the new tunnel that is being drifted into the hill from the mouth of the working shaft. This mine proves to be a veritable store house of rich ores, the extent and richness of which increase as development work is done.

CHAPARRAL.—The Chaparral is steadily pushing ahead, and a four-foot ledge of pay rock has been discovered.

Shasta.

GLADSTONE.—Shasta Courier, Jan. 30: The Gladstone Co. tied up pro tem, but is in full blast again, and its product was one 92 pound brick, and another of similar weight since.

TRAMWAY.—Redding Free Press: James Barron is engaged in putting in a tramway from the old Carson & Snyder mine to the mill.

THE CALUMET CO. intend bringing their capacity for working the new process (cyanide) up to 50 tons a day as soon as it can be done. The Calumet mill, which has been for some time altering for working the cyanide process on a large scale, will be completed in part, and will start running the coming week. Some very rich ore has been taken from the Poorman mine, belonging to the Calumet Company, and hauled to the mill, to be worked by the cyanide process.

NEW MACHINERY.—The proprietors of the Lost Confidence mine at Iron Mountain are preparing to put in about \$20,000 in additional machinery and in overhauling and repairing the plant. Twenty stamps will be added, thus making 40 stamps in all, and a new roaster will be put in. J. M. Gleaves has been installed as Superintendent of the Little Nellie mining property on Iron Mountain, and is making arrangements for active mining. Men will be put to work on the mine, and the ore will be sorted, a portion shipped for reduction and a portion worked in the mill.

IGO.—Alexander Ludwig of Igo informs us that the outlook for Igo is splendid, and it is the mines that are doing the business. Five mines are shipping ore to Selby with good results. John Wright recently shipped 12 sacks of 130 pounds each, and received in return \$203 in solid coin. These mines are all silver, with a percentage of gold in the ore. Wright shipped 25 sacks Thursday. W. D. Bull has about three tons sorted and ready for shipment. Eubanks has made a shipment and is taking out more rich ore. H. W. Hutton, a lawyer of San Francisco, has the Crystal mine bonded, and is shipping ore. Robinson & Son are also getting good returns from ore shipments. Fritz Groner and Bill Richter recently discovered a silver mine about a half mile from Mr. Ludwig's house. The ledge showed three inches of Chloride silver on the surface and assayed \$34 to the ton. A big and rich ledge is expected upon sinking.

NEW COMPANY.—The Cross Bow Gold Mining Company, whose mine is located near Middle Creek, has incorporated with a capital stock of \$500,000. The directors are Alexander R. Becker, Arnold Becker, Henry D. Walker, J. F. Leicester and L. A. Washburne. A ten stamp mill will soon be erected.

Sierra.

AROUND SIERRA CITY.—Mt. Messenger, Jan. 30: Water is rather limited at the Young America, necessitating stoppage of some of the stamps. Cleanup for past month to 15th inst, \$7000.

ARTIC PLACER M. Co., at Howard Creek, is driving a bedrock drain tunnel night and day, with all possible vigor, to open an extensive gravel bed, a mile in length and a depth of 50 feet. Surface gravel paid Portuguese \$1 a day, and when the tunnel is completed the owners think the ground ought to yield \$100, daily, with only four men employed.

Siskiyou.

QUARTZ.—Yreka Journal, Jan. 27: Myron Canrick and K. McPherson, who have a good ledge of quartz on Greenhorn, had seven tons crushed lately at the quartz mill on Humboldt, which realized \$40 a ton. Owing to the deep snow at their claim, they postponed further prospecting until spring, and should it continue to prove as extensive as present indications predict, will put up a mill at the mine.

FAVORABLE.—The cold dry weather lately has not been very favorable for mining, as it keeps the streams frozen, and water is not turned into ditches for fear of choking up with ice. There is just enough frost every night to freeze the snow, so that the hot sun during the day has but little effect upon it in the shady gulches and timbered forests covering most of the mountainous sections.

THE ENGLISH COMPANY.—When the English Co. which has recently purchased the Campbell hydraulic mines in Quartz Valley, commences operations, we may anticipate lively times in that locality, to create a boom in mining, and at the same time be of great benefit to the farming community and business men in the way of furnishing supplies for the large number of men to be employed.

Trinity.

RAIN.—Trinity Journal, Jan. 30: The miners in this county are joyful over the present prospect of a good mining season. The snow is being trans-

formed into water on the lower hills and every little storm deposits more snow on the high mountains. The fall during the past week measured 1.46 inches. Total to date, 18.23. This is more than the average fall for this time in the season. In 1891 only 8.69 inches had fallen and still the miners had a good season, as the fall came in such amounts as to be easily handled.

NOT SO BAD.—The damage to the Chloride quartz mill on Canon creek is not so great as was first reported. The building is a total wreck but more of the machinery is left than was expected. Probably \$1000 may repair the damages.

Tuolumne.

BONDED.—Tuolumne Independent, Jan. 30: The Engelke mine, on Experimental gulch, was recently bonded by a company consisting of T. B. Valentine, W. G. Whorf, and others. The mill has been idle for some time because no water could be had. The water reached the mill last Saturday evening, and work was commenced at once. The vein is several feet in width, with limestone hanging wall and slate foot wall. The quartz is full of iron, which looks like it had been melted and fused. The vein is only about 40 feet from the surface. Tunnels have been driven a little over 100 feet north and south and stopes raised in each. The mine has never been worked in a way that would demonstrate its value. Whorf is now superintending the work. He has put in a Woodbury concentrator, and will mine and mill enough of the ore to demonstrate to a certainty its average value. Assays have shown that some of the ore goes into the hundreds per ton. Mr. Whorf trusts nothing, however, but a milling test.

UNDER THE LAVA.—Gus Weidekind has been tunneling under a deposit of lava in Experimental gulch, above Columbia, over six years. No one knows whether his work has been profitable except himself, and he is very reticent in regard to the matter. Experimental gulch, however, was very rich in placer gold, both above and below Weidekind's claim. It was probably one of the richest in the world. At the time it was mined nothing was known of dynamite, and the cemented lava was too hard for picks or black powder to have any effect upon it. Several miners attempted to find the channel before Weidekind secured the property. They drifted into the mass from the east side, and found numerous nuggets of pure gold, from 50 cents up to over \$100 each. But no bed of gravel was found. Mr. Weidekind recently drifted in near the upper side of the knoll, and last Saturday found a streak of gravel. He prospecting it as soon as he got into it a few inches, and got 40 cents in coarse gold in the first pan. It now looks like he had found the main channel he has so long been searching for; and if he has he will probably be richly repaid for his work.

NEVADA.

Washoe District.

CON. CALIFORNIA & VIRGINIA.—Virginia Enterprise, Jan. 23: 1100 level.—The crosscut, No. 2, running west from the main south drift, 40 feet south from east crosscut No. 4, has been advanced 45 feet; total length, 145 feet in a porphyry formation. 1500 level.—At a point in the old south drift, 155 feet south from the old shaft station, a west crosscut was started and has been advanced 36 feet. From the end of this crosscut an upraise has been carried up 10 feet. 1600 level.—Have been retimbering and repairing the main south drift on this level, and are continuing the work of prospecting upward from the sill floor. 1650 level.—Have continued to extract ore of fair quality, and from the drift run west from the top of the upraise carried up 50 feet above the southwest drift. 1750 level.—In working out and upward from the bottom of winze No. 2, sunk from the 1650 level, we continue to extract ore of fair quality. There has been extracted from all parts of the mine during the past week 1,017 1510-2000 tons of ore, which was shipped to the Morgan mill. The average assay value of the ore worked at the mill during the week (980 tons) was \$32.48 per ton. Bullion shipped to Carson Mint, assay value, \$28,317.59.

OPHIR.—1465 level.—From the drift run west from the winze 122 feet below the sill floor of the 1300 level, 80 feet west from the mouth of the drift, a north drift was started and has been advanced 20 feet in porphyry and quartz formation, which carries a low assay value.

MEXICAN.—On the 1465 level the crosscut started west from the bottom of the winze sunk 101 feet down from the end of the crosscut run west from the main north lateral drift near the south boundary line of the mine, has been advanced 9 feet; total length, 48 feet; face in very hard porphyry. From the bottom of the above mentioned winze, opposite the west crosscut, an east crosscut has been advanced 18 feet, and is in a favorable looking formation.

UNION CON.—On the 900 level the joint Sierra Nevada and Union Con. south lateral drift from the main west drift, at a point 1570 feet in, has been extended during the week 23 feet; total length southward, 102 feet; face in quartz giving low assays.

GOULD & CURRY.—200 level.—East crosscut No. 4 from southeast drift No. 2 has been advanced 24 feet through porphyry; total length, 106 feet. 65 feet above 200 level.—West crosscut No. 3, 165 feet north from upraise No. 2, has been advanced 22 feet; total length, 87 feet; face in porphyry, clay and quartz. 350 level.—West crosscut No. 1, from top of upraise No. 2 from 400 level, has been extended 20 feet through soft porphyry and stringers of quartz. Opposite west crosscut No. 1, started east crosscut and advanced same 20 feet in porphyry and quartz. On the Sutor tunnel level the joint north drift with the Savage is advanced a distance of 135 feet, the drift having been extended 95 feet previous to resuming work there; face in porphyry.

BEST & BELCHER.—900 level.—At a point in north drift, 1000 feet from top of upraise from 1000 level, started a west crosscut No. 1 and advanced same 30 feet through soft porphyry and stringers of quartz.

Tuscarora District.

NAVAJO.—Times-Review, Jan. 29: South intermediate drift below the 350-foot level has been extended 7 feet; the vein continues small. South intermediate drift extended 6 feet; ore not so high grade.

COMMONWEALTH.—Fourth level.—Joint raise from No. 2 south intermediate drift has reached 2d level, distance 105 feet in the vein, exposing ore about 12 inches wide, some of which is good grade, assays from \$18 to \$160 per ton.

NORTH COMMONWEALTH.—Hoisted 52 cars of 2d class ore; car sample assay \$56 per ton.

BELLE ISLE.—No. 1 winze, No. 3 vein, extended 10 feet, showing good ore in the bottom. Have started a winze on No. 1 vein, 250-foot level, which is showing some very fine ruby ore.

NORTH BELLE ISLE.—A crosscut has been extended 14 feet westerly from the north end of No. 3 drift, 400-foot level, through vein matter, cutting a seam of good ore on the hanging wall. No. 3 upraise, on same level, extended 8 feet, still in good ore.

DEL MONTE.—Second level.—No. 1 raise from west drift reached the ore at 30 feet; it is good ore, assays \$79.13 per ton. Started drift under the ore to connect with the line stopes; face of drift is in 19 feet, with some ore in top, distance through to stopes is about 50 feet. Extracted 61 cars of ore.

NEVADA QUEEN.—Second level.—No. 1 south drift has been extended 20 feet in hard porphyry. No. 1 raise from No. 1 south drift has reached the hanging wall, the vein being 21 feet between the walls, all of which give low assays of \$3.65 to \$30 per ton.

ARIZONA.

PROBABLE ACTIVITY.—Arizona Journal-Miner, Jan. 30: The year 1892 promises to be the most prosperous in regard to mining of any year in the history of this country. One of the best evidences to base this prediction on is the fact that during the past year a very much greater number of affidavits of assessment work has been filed for record than in any single year previously. A larger number of claims are also being patented than at any time in previous years, no less than 37 plats of mining claims having been filed in the United States Land Office this month, preparatory to the claimants making their applications for patents, while several other surveys of mining claims have been made. One or two mining sales of considerable importance have already been made this year, while there are a number of others under negotiation, with prospects favorable for their consummation. That the prospect for building the S. F. & P. Railroad has been largely instrumental in causing this activity there can be no question, and with active work now commenced, a still greater activity will result from it. There are very many claims contiguous to the line of this road which could not be worked heretofore on account of the exorbitant rates of transportation that can be made to yield large profits with the construction of the road, and which will also contribute largely to the traffic of the road.

SILVER.—Tombstone Epitaph, Jan. 29: With free silver, the Comet mine in this district will prove to be one of the most valuable. Its ore body is almost inexhaustible, and an additional 55 per ton value given it by a free coinage bill would place a profit of \$15,000 per month into the coffers of the owners on a basis of what it can do at present.

LYNX CREEK.—Prescott Courier, Jan. 30: The Lynx Creek Gold and Land Company, under the management of Messrs. Barlow-Massicks and Pedley, have expended a great deal of money in their Lynx Creek enterprises, and are now only in need of water to commence operations on a paying and extensive scale. It is authoritatively stated, also, that the Lynx Creek dam will be rebuilt.

SHELTON.—Sam Dennis came in last evening from the Shelton mining group, says 100 tons of ore from those mines have been successfully run through the Clark & Adams quartz mill in the last 12 days, and that work has been temporarily suspended on the mines, owing to trouble in packing ore over the snowy divide and the great difficulty in keeping sufficient hay at the mines for horses to live upon.

BRITISH COLUMBIA.

SLOCAN CLAIMS CHANGE OWNERS.—Nelson Miner, Jan. 30: During the week a number of Transfers of claims situate in Slocan district have been placed on record at Nelson, all the purchasers being Americans. Price McDonald realized \$2500 by selling the Eagle and Seattle, getting \$1500 for the former and \$1000 for the latter. H. G. Bond of Seattle took all of the Seattle and two-thirds of the Eagle, the other third of the Eagle going to G. B. Wright of Tacoma. Mr. Bond also purchased the Lucetta from E. E. Fletcher, paying \$1500 therefor. Thos. Trenery cleaned up \$1000 for his interests in the Wellington, Jay Gould, Eureka and Perhaps, being an eighth in the first three named and a half in the last named. The man who paid the money was L. C. Dillman, the well-known Spokane real estate dealer. This goes to show that men with money believe the reports of the wondrous richness of the discoveries made in Slocan, for neither of the purchasers have seen more of their properties than a picked specimen or two of ore.

THE FACE OF A DRIFT IN SOLID ORE.—Superintendent Robertson reports the south crosscut from the Grizzly tunnel in 20 feet, with indications that the ledge is not far distant. He also reports that the face of the south drift from the Dandy crosscut tunnel is in solid ore, and that the property never looked better. The average progress was made during the week in the Silver King tunnel, and it is now in a total of 760 feet.

THE SILVER QUEEN STOCKED.—J. E. Boss has returned to Spokane from Montreal, where he succeeded in placing the Silver Queen, the south extension of the Kootenay Bonanza, on Toad Mountain. The new company is known as the Silver Queen M. Co., and its stockholders are among the solid men of Canada's greatest commercial city.

COLORADO.

THE MINING OUTLOOK.—Denver Republican, Jan. 28: The year 1892 has opened with a very promising outlook for mining in this State. There are indications that there will be more work done in the mines than in any previous year, and that prospecting will be more active than it has been since the decline of the excitement which grew out of the discoveries at Leadville. The old camps like those in Clear Creek and Gilpin counties, and like Leadville, Aspen and the towns of the San Juan, will in all probability make as good a showing as they did last year. In some cases, the output will probably be greater. There is plenty of mineral in the Aspen district to admit of the enlargement of the output of that camp, and there may be considerable growth in the Red Mountain district near Ouray. What

makes the outlook exceptionally bright is the discovery of ore at Creede and Cripple Creek. These two camps are of themselves capable of making this an exciting year in mining. They are booming now, and yet they were hardly talked about by the general public when the Silver Convention met here last November. People are going into each place at the rate of about one hundred per day, and this is likely to keep up until the first snow comes next fall. There is less definite information about Cripple Creek than Creede, for there has been more development at the latter. Besides, it has a railroad, and this makes it easy to reach the camp, as well as to ship ore out; but if the result of work at Cripple Creek shall justify it, the Midland will soon build a branch from its main line to that place. The Cripple Creek prospects seem to be chiefly gold claims, and the other day a strike was reported to have been made there in wonderfully rich ore. It is a railroad ride of only about six hours from Denver to Florissant, where the stage starts for Cripple Creek. The stage ride occupies about six hours more; so that one can go from Denver to Cripple Creek in a day. Some of the enthusiastic believers in Creede think it will indeed be a second Leadville, and there seems to be a good deal to justify their hope. It is certainly a wonderful place, and it is in the midst of a district which is enormously rich. It is rapidly advertising itself, and its fame is likely to extend all over the Union in the course of a few months. It is already a heavy shipper of ore, and long before the summer is over, the shipments will probably be doubled. Creede seems to present opportunities for making money very similar to those that were seen in Leadville in the early days.

IDAHO.

TRADE DOLLAR.—DeLamar Nugget, Jan. 25: They are whooping things up at the Trade Dollar on Florida mountain. The air drills are doing rapid work in enlarging the Blaine tunnel and fans, and a new 15-horse power engine to drive them is now on the way in, so that work on that tunnel, which will take six or eight months to push under the Trade Dollar ore shoots, may be pushed as rapidly as possible. The track has been laid into the new ore house at tunnel No. 3, and the first carload of ore dumped into it on Saturday.

BULLION.—Eight bars of bullion were shipped out by the DeLamar Mining Co. on the 20th inst, and six more followed to-day, making, with the shipment previously reported by the Nugget, this month, 22 bars averaging slightly over \$2000 each in value.

SNAKE RIVER FINE GOLD.—Idaho Falls Times, Jan. 25: For a great number of years placer mining has been conducted along the Snake river, and probably in no place in the world is there another as great a deposit of fine flour gold as there is in the valley of this stream. Mining has been successfully carried on from Idaho Falls down to a few miles below the high bridge of the Oregon Short Line, a distance by stream of nearly 400 miles. Above the bridge for about 70 miles there are only a few inches fall to the mile, and while the bars on each side are rich in gold, the difficulty of getting water on them is such a great obstacle that comparatively little mining has yet been done. At all points where water can be secured in abundance there is undoubtedly good pay in store for judicious mining. Glenn's ferry is at the upper end of the sluggish portion of the river, about 100 miles from the Oregon Short Line bridge. Above the ferry the stream has a heavy fall most of the way from its source. Several machines are kept in operation in the season at the ferry and are said to pay handsomely. Between Shoshone Falls and American Falls various parties have placed in large wheels and are taking the water from the river, and are realizing large profits. With all the canals that will soon be taken out of Snake river, the water will be lowered so that miners can work the center bars at great profit. It is not unreasonable to expect a return of the California days of '49. The bed of Snake river is lined with gold, and all that is needed to successfully operate it is to reduce the flow of water from the stream by means of canals. Idaho will yet take the lead as the gold producing State of the Union.

LOWER CALIFORNIA.

SILVER MINES.—Lower Californian, Jan. 26: On the last trip of the Emma down the coast, her skipper again made a journey across the Peninsula to the San Juan silver mines, and from him we learn that the mines situated on Los Angeles bay are turning out very rich ore, and at present the company owning them has seven mines located—the San Juan, Coronado, Consuelo, Picacho, San Pedro, Ventura and Creston. The six last named are only small workings as yet, but the San Juan is now 267 feet deep, having two tunnels and four shafts. This entire group of mines is located on the San Juan mountain, and the company is now running a tunnel through the base of the mountain, commencing at both sides. This tunnel will crosscut the different ledges at a depth of 600 feet or more, and when completed will have a total length of 2400 feet. The company is daily expecting a large vessel from San Francisco, with material for the tramway to be constructed from the summit of the San Juan mountain (5000 feet above the sea) to Las Flores valley, where the reduction works are located. It is expected that the capacity of the mills will be increased upon the completion of the tramway, which will be two and a half miles long and of the Hallidie system. Las Flores, where the mills are located, is becoming quite a thriving little town, and already contains 300 persons, while at the mines 100 men are employed.

ALAMO ITEMS.—The Princess is well started in drifting on the new vein at the 200-foot level. The work is done with the Burley air drill and full shifts of men. The San David boiler, the largest in the camp, has been moved over to the Princess mill, and as soon as arranged the mill will start running night and day. It is the new vein will supply enough rock to keep the mill running constantly. The Aurora is working as usual, although the output of quartz is not very large. The mill runs 15 hours and would run night and day if water could be obtained. The tributaries on Aurora ground have a good thing on some rich stringers. The Sheldon mill runs the whole 24 hours on La Flor rock, and the French company is doing well. The Manzanita mill has been running continuously on custom rock, mainly from Mexican mines and prospectors

have very good luck in finding small lots of rich quartz.

MONTANA.

DULL.—Phillipsburg Mail, Jan. 28: While it is evident that the mining industry is being pursued with the usual vigor in the Flint Creek district this winter, the matter of gleaming live mining news is dull as usual at this season of the year. The hills and gulches are heavily covered with snow, making it impossible for the prospector to make new discoveries. Work on the larger prospects, such as the Bi-Metallic Extension, Fanny Parnell and others, is pushed on energetically with every hope for ultimate success, and of the numerous claims worked under a lease many of the operators are taking out and shipping ore right along.

THE BI-METALLIC.—It is now evident that the Bi-Metallic mill will be shut down entirely until the new reel shaft arrives and is put in position at the mine. About half the mill hands have already been laid off, and before the close of the present week several more will be given a rest until operations are again under way at the mine. It is thought that the shaft will arrive some time next week, and within 15 days all the works will be under way as usual, therefore the effect of the shutdown will scarcely be noticed. In the meantime the mill will be given a thorough overhauling and repairing, so that when the hoist can run again the reduction works will be in first-class trim.

NEW MEXICO.

DEVELOPMENT WORK.—Silver City Enterprise, Jan. 27: A contract has been let for 400 feet of development work on the Ann Arbor on Silver creek. The old Custom mill at Gold Hill will be started up on ore from the Reservation next week. The Grand Central of Central district is now showing seven feet of solid ore, two and one-half feet of which is said to average \$500 per ton. Mayor A. J. Spaulding and Col. R. S. Allen, who have been doing some very hard work on their mine in the north-west corner of Central district, are being well rewarded for their labor. They are now down about 40 feet, and have a two-inch streak of almost "pure truck," as the Colonel expresses it. It is one of the most promising prospects now working in this section.

OREGON.

SILVER BRICKS.—Bsdrock Democrat, Jan. 27: The First National bank was visited by a large number of people yesterday, drawn thither by the exhibition of the large silver bricks from the Morris mine at Greenhorn, the result of 25 tons of ore reduced at the Monumental mill. Gold bricks are of frequent occurrence here and usually create no special interest, but silver bricks are a rarity. The output is the first from the Greenhorn section, a new camp. The success attending the working of the Greenhorn ores in the Monumental mill, superintended by Mr. C. S. Miller, is important and gives assurance of great results the coming season, or as soon as the snow disappears, allowing the mine owners of Greenhorn to transport their ores to the mill. Not alone will the Morris mine contribute ore to the mill, but there are many other properties undergoing extensive development this winter.

PROBABLE LITIGATION.—The past few days have developed the report that there is liable to be trouble over the ownership of the celebrated White Swan property, and that the courts will be appealed to by one or more persons in the attempt to gain possession of the property, or make it an object to the parties now in possession of the mine to recognize the rights of the contestants.

RICH STRIKE.—Within the past few days since the water in the Virtue mine has been lowered below the first level, admitting an examination of the ore vein exposed, Superintendent Oliver has been prospecting the body of ore and finds it to be exceedingly rich. Last Saturday, in knocking down a few pieces from the ledge the quartz was literally covered with gold and several specimens were brought to this city by Mr. Oliver. From present indications there is every assurance that the new company operating the mine has a bonanza and it is almost a certainty that it will be justified in working the property on a more extensive scale than ever before known, even in its palmiest days.

UTAH.

NOT CLOSED DOWN.—Park Record, Jan. 30: It transpires that the Record's information concerning the closing down of the Morning Star mine until spring was an error, for the property is now being worked with greater activity than ever, with increasing prospects of becoming a large and rich shipper early next summer. It seems the mine only suspended operations for about ten days during the holidays, and as soon as the boys employed at the mine got through celebrating, work was again resumed with redoubled energy and is being prosecuted without interruption.

AT THE LUCKY BILL.—Matters at the Lucky Bill are assuming a very encouraging appearance, and the indications are that the property will show up a fine body of shipping ore before the snow is gone in the spring. Early this week, while cutting a station on the 300 level, a seam of fine vein matter was encountered, in fact it was ore, and shows that the shaft is getting very close to the big chute of ore in the old shaft.

WASHINGTON.

STRIKE IN THE ST. CLAIR.—Okanogan Outlook, Jan. 27: Dudley and Hanway made a very promising strike in the St. Clair yesterday. They were sinking an incline shaft on what they supposed was the foot wall of the ledge, but which proved to be only a seam in the formation. They discovered their mistake yesterday and demonstrated that instead of being on the foot wall they were gradually approaching the hanging wall, and were working right on top of their ore chute. Yesterday afternoon while showing some visitors over the property, and prying about with a pick in the bottom of the shaft, they dug out some handsome pieces of brittle silver and black sulphure ore. They investigated the discovery enough to satisfy themselves that they were working above the ore chute, and will change the dip of their incline shaft so as to prospect the chute and eventually drop back onto the foot wall.

SCIENTIFIC PROGRESS.

Dynamite to Give Place to Electricity.

Edison would not be the wizard that he is said to be if he did not announce something new every few days. He now proposes as a means of defense or attack in war to devise a way by which electricity may be poured out from a hose upon an enemy as water is thus thrown out under great pressure. He says that with 25 men in a fort, he could make any fort absolutely impregnable, so far as an assault is concerned. This is not guesswork, but a matter of scientific certainty.

WATER AS A CONDUCTOR.

"Some years ago," he said, "when the wires loaded with heavy electric charges began to go underground, I predicted that there would be danger of the firemen receiving a deadly shock by the electricity running down the streams of water which might cross the wires. In each fort I would put an alternating machine of 20,000 volts capacity. One wire would be grounded. A man would govern a stream of water of about 400 pounds pressure to the square inch with which the 20,000-volt alternating current would be connected. The man would simply move this stream of water back and forth with his hand, playing on an enemy as they advanced and mowing them down with absolute precision. Every man touched by the water would complete the circuit, get the full force of the alternating current and never know what happened to him. The men trying to take a fort by assault, though they may come by tens of thousands against a handful, would be cut to the ground beyond any hope of escape.

MIGHT MERELY STUN THEM.

"Foreign soldiers undertaking to whip America could walk around such a fort, but they never could get through it. It would not be necessary to deal out absolute death unless the operator felt like it. He could modify the current so as simply to stun everybody, and might then walk outside his fort, pick up the stunned Generals and others worth keeping for ransom or exchange. He could also make prisoners of the others if he chose to do so."

FAULTY LANDSCAPE PHOTOGRAPHS.—It is well known to those informed in such matters that very few landscape photographs are correct in perspective. It is laid down as a rule by those well skilled in such kind of photography, that any photograph taken with a lens of less than about a foot focal length must exaggerate all the distances, or make objects in the picture look smaller than they should. The only remedy for this is to enlarge the picture until the right distance to view it from becomes also the convenient distance. Even if this be done, however, there is a tendency still to view the picture too far off; for few lenses, except those for portraits, embrace an angle so small as to be taken in a single glance, and people are naturally inclined to stand far enough from a picture to see the whole of it at once; still, a proper amount of enlargement offers the best means of making a photograph give a true idea of the scene which it represents, this being especially true of the small pictures taken by the so-called detective cameras, having lenses varying from four to six inches in focal length, and for which the enlarging process would be particularly useful.

A PECULIAR CHARACTERISTIC OF GOLD consists in its strong cohesive properties. If we take a sheet of gold foil and let it fall upon another it will be so firmly fixed that it cannot be removed. The pressure of the atmosphere upon the upper surface and the approximate vacuum between the two surfaces have some effect; but other experiments show that there is something beyond that—that the two pieces by thus coming easily together are actually welded. No other metallic surfaces thus brought together manifest any such cohesive powers. It is this peculiar property that makes gold so much preferable to any other metal for dentist's use. But for this peculiarity of gold, silver would no doubt be much used in dentistry as a cheaper material. But its adherence is quite limited, while the gold used in filling a tooth is actually welded together and fills the cavity just as completely as though it was melted and run into it. Two comparatively thin pieces of gold, with even surfaces, may be welded together by a very little pressure, applied by running the pieces between two rollers. Gold is thus welded to sheets of silver for the manufacture of cheap jewelry.

THE MICROSCOPIC STRUCTURE OF STEEL was recently discussed at a meeting of the

Amsterdam Royal Academy of Sciences. M. Bebrans stated that under high powers of the microscope, the network in hardened steel may be made visible on polished slices without etching or annealing—the dark, sinuous lines answering to the bright ones shown by Sorby and Wedding on etched slices. It is proved that hardened steel contains hard granules bound up in a matrix of soft iron. Some varieties of gray iron from small castings may be hardened like steel, most of the graphite disappearing. After annealing the metal at a red heat, however, the slices were dusted with a dark-colored dust and the graphite seemed to have reappeared.

INDUCTIVE LIGHTS.—At the meeting of the American Institute of Electrical Engineers Mr. Tesla employed a machine having 400 poles, which, when run at full speed, enabled him to obtain 20,000 alternations per second. He believes that electro-magnetic waves cannot produce luminous effects unless they have the frequency of true light waves; but this is not the case with electrostatic waves or thrusts, as these can excite luminous radiation no matter what their frequency may be. He made many experiments with Geissler tubes, and also with lamps in which only one terminal was used. The filament consisted of a single rod, which was in a nonstriking vacuum. The energy was transferred entirely by condenser action through the coatings in the base of the lamp. He also showed how exhausted tubes could be made to glow in an electrostatic field, so that if such tubes were merely hung up in a room in which such a field was produced they would be lighted up, and could be moved about at will. These experiments created the most intense interest, and point to methods of producing light which may be used in the future.

CHEMICAL HEAT.—The North of France Railway Co. is about to experiment upon a method of warming its cars by chemical heat. The heat is to be derived from acetate of soda. That chemical will be placed in boxes in a solid state and then immersed in water at 100° F., thus liquefying the soda. The heat will be obtained by the process of the subsequent solidification of the chemical, which will gradually take place after the boxes have been taken from the water. This process can be repeated continuously, each immersion requiring from five to six hours' time to solidify. If such results are possible of attainment, why would it not be a convenient, cheap and safe way of warming conservatories during the winter months, especially in the comparatively warm climate where but little artificial heat of California, is required, and that seldom needed during sunny days?

A NEW SOLVENT OF CAMPHOR.—From the frequency with which the indications for the subcutaneous injections are met with, it is evident that a good and reliable solvent for this substance is a great desideratum. Ethereal solutions rapidly evaporate. Alcoholic solutions also evaporate, and the camphor becomes precipitated, so that injections of such solutions produce severe pain or even abscess. Solutions of camphor in oil are difficult to employ, while besides possessing the disadvantage of the liability of becoming rancid. In the *Zeitschrift für Therapie* for September 1, 1891, Dr. Karl Rosner recommends in the highest terms a solution of camphor in liquid paraffine, which, when slightly warmed, forms a perfectly clear and limpid solution. He states that he has kept this solution for more than five years without its properties becoming changed.

AN IMPORTANT ANNIVERSARY.—An impressive ceremony took place at Bordentown, N. J., on Nov. 12th last, on the occasion of the completion of a monument erected to mark the spot where, 60 years ago, the first piece of track was laid on the road built to connect New York and Philadelphia with the iron rail. This work was the real inauguration of the present great railway system of the United States. The English locomotive, John Bull, the first regular locomotive ever put upon a rail in this country, was put together at this place and first placed under steam on this road.

THE KEYNOTE OF AN AUDITORIUM.—In rooms of poor hearing qualities Dr. Ephraim Cutter says: "Every hall or church has its keynote, and the audience will bear better if the speaker's voice is pitched and held to the keynote of the room. To find the keynote sing the natural scale slowly, evenly and smoothly, or play this scale on piano or organ. The note which is most prominent is the keynote."

IN AUSTRIA, experiments are being made with the view of replacing steam by electricity for rapid, long-distance railroad travel.

MECHANICAL PROGRESS.

DON'T MAKE A MISTAKE.—Some engine makers are turning their attention to the manufacture of dynamos. One who is thoroughly acquainted with the latter, offers to such the following words of caution: "This is a work which requires most careful consideration, and no doubt those who have taken the step have given it such. Dynamo making does not simply consist in winding various sized iron bars with wire. There are many important considerations beyond those which appear on the surface, before an efficient dynamo can be made. Firms like Crompton & Co., Siemens Bros. & Co., The Brush Co., and others, have been for years studying the construction of dynamos in every detail, and the best machines of the present day are showing an efficiency of 94 and 96 per cent. Engine makers who wish to extend their business by introducing dynamo making should at least take the precaution of employing only competent workmen, with managers who have had years of experience in practical dynamo building."

FLEXIBLE METALLIC TUBING.—A new flexible tubing, which is made entirely of metal, disposed in a very ingenious manner, is being introduced by a London firm. The tubes are produced by a machine from strips of metal of the required length, width and thickness. These strips, in passing through the machine, are corrugated longitudinally with a large and a small corrugation side by side. The tube is formed by the corrugated strip being coiled spirally round a mandrel in such a way that the small corrugation enters and interlocks with the large one, and forms what is known as a piston joint. Formerly, this kind of flexible tubing was made steam and water tight by means of a strip of india rubber inserted in the interlocking corrugations. This tubing, it is said, answered well for many purposes, but in some cases the substances passed through, caused the india rubber to deteriorate.

A SIMPLE, HIGH SPEED, STEAM MOTOR not requiring the constant care of an expert hand, is a great desideratum which it is thought has been quite fully realized in an apparatus described as follows: The cylinder is contained in a cylindrical casing, which rotates in the short arc of a circle as the crank turns, and by so doing opens and closes the ports, thus practically dispensing with the services of valves. A rigid piston rod is, of course, utilized, and the bottom of the casing in which the machine is enclosed is filled with water, floating a layer of oil, into which the crank is dipped at every revolution. These engines are made in sizes ranging from two to 15-horse power, and some of the smaller ones can be run at 2000 revolutions per minute. The engine can be suspended from a beam like the hanger of a shaft.

ELECTRIC WELDING OF IRON WHEELS. Electric welding is now applied to the work of manufacturing iron wheels. The process of welding the hub, spokes and tire of a wheel is accomplished in 30 seconds. First the tire is laid on the machine, then half of the hub, which contains notches in which the spokes fit. The latter are laid in the hub and inserted in the tire, and then the other half of the hub is laid on top of the lower half. These are held together by hydraulic pressure. The electricity is turned on, the iron becomes heated to the proper degree and welds. The pressure is removed, the now compact wheel taken from its resting place, rolled aside and allowed to cool. The work is done in very much less time than it took by the old process.

A HIGH RECORD.—What is thought to be the highest record in the rolling of steel rails was recently accomplished at the Edgar Thomson Steel Works, Pa. During 24 hours, 1907 tons of rails were turned out, beating the record of the South Chicago rolling mills by 232 tons. The manager started out with the intention of turning out 1800 tons.

GUN METAL FOR STEAM WORK.—It has been demonstrated that gun metal is the best for steam. It is therefore a superior article for valves, as by simply regrinding the disk, or in any case by having the disk replaced, it can be made as good as new. Such is the opinion of one of our most experienced steam engine manufacturers.

SOLDERING ALUMINUM.—It is asserted that pieces of aluminum may be successfully soldered to each other and to other metals by using silver chloride as a flux in conjunction with ordinary solder. The metals, one or both of which are aluminum, are placed in the relative position required

in the joint, finely powdered fused silver chloride spread along the line of junction, and solder melted on with a blow pipe or other device. It is claimed that joints are thus easily and rapidly obtained, and become hard and perfectly sound in setting.

FINE MECHANICAL WORK.—Prof. Rowland of the Johns Hopkins University has recently manufactured a screw for his dividing engine, which is said to be more nearly perfect than any other of the kind that was ever produced. It is made of the best of Jessop's steel. It is 1½ inches in diameter and 17 inches long, and has 20 threads per inch. It was first cut in a lathe in the ordinary manner, and then ground by using a nut equal to it in length, which was placed on it with washed emery, and the screw revolved under a bath of water and oil maintained at a constant temperature. The grinding required about three weeks. It is to be used mainly in ruling gratings for spectroscopes, and it is thought will be capable of ruling a million lines to an inch! There are a thousand notches in the head attached to the screw, so that the movement of a notch advances the thread one-twenty-thousandth of an inch.

TO MAKE A BLACKSMITH'S FIRE WITHOUT SMOKE.—A correspondent of the *Blacksmith and Wheelwright* says: "Very often during the day a blacksmith's fire will go out several times, and in using wood to build it again the shop will become filled with smoke, thereby causing a loss of time. In such emergencies I pursue the following method: I have a quart bottle of kerosene oil always handy. I remove some of the coal, pour out a little oil, light it, work the bellows, put on coal, and in a surprisingly short time the fire is ready to work, with no smoke and very little time lost."

ALUMINUM is to be substituted for cast iron in the towers of some new public buildings at Philadelphia. There will thus be a saving of some 400 tons in weight, and the constant expense of painting will be avoided.

THE WOOD WORKER.

The Demand for Timber for Pulping.

The pulping process of treating wood it is thought will soon be found valuable for economizing scarce and valuable timber. The rapid disappearance of the large and slow-growing white pine in particular has become a well-known and solid fact. The pulp process is now employed as a means by which the smaller trees which it may be desirable to cut out, in order to insure a more vigorous growth for the larger, may be utilized by being reduced to pulp and pressed in molds into the sizes and shapes desired. At the present time such economy may appear ridiculous; but with the rapidly increasing rate of consumption of our valuable forest trees, and the increasing character and means for utilizing waste products, the above suggestion will soon become a matter of no inconsiderable importance.

A few years since poplar was in chief demand for the pulping process; but now only spruce is used to any extent. In the forests of New York the cutting of spruce is going on at a rapid rate. Very few have any idea of the immense amount of timber required by the pulping industry. It is claimed that in the Adirondacks three-fourths of the timber is spruce, the remaining one-fourth being hemlock and pine. The largest wood pulp mills in the world are on the Hudson river. One concern produces 55 tons of pulp a day all the year round. This is consumed largely by the New York daily papers. Another mill of the same capacity is being erected. The second largest mill has a daily capacity of 45 tons. The great pulp manufacturers of the Hudson require about 125,000 standard logs annually. A standard log is 19 inches in diameter and 13 feet in length. Notwithstanding the large amount of wood pulp produced in the State of New York, much more is turned out in Maine, where the industry first had its birth. Pulp mills are now being established in Washington, and a new draft will soon be made upon timber regions of the Pacific Coast.

In this connection a word may be said about the timber of Alaska. The *Post* of this city recently published an interview with a saw-mill man who is personally acquainted with that distant part of the country. He said: "I once ran a saw-mill there, and therefore know something about the timber. There are no large belts of timber there. The timber is in the gulches and lowlands. The land in Alaska rises up to a great height abruptly from the water, and the higher the land the sparser the timber. The hemlock is faulty and 'shaky' and not of large size. Then there is some spruce.

The most valuable timber there is the red and yellow cedar. This latter is by far the most valuable. I think it would pay to ship logs of it to Seattle, San Francisco and the East. It makes the finest kind of finishing for the interior of houses, and would make splendid desks and furniture. It has a beautiful color, works well, and has an aromatic odor."

A NEW WOOD PULP PROCESS.—Attention has recently been called to quite a new process for utilizing wood pulp: "The pulp is taken as it comes from the mill, and after first fully drying it or not, as circumstances may require, it is immersed in an indurating pickle, so called, with coloring if desired. This pickle is composed of any compound or solution capable of indurating the mass, and after the material is taken out of the pickle and thoroughly dried it is run through a mill and ground sufficiently fine to insure a mixture of the particles which have not absorbed the indurating substance with the particles which are fully hardened. The powdered pulp is then compressed with the application of heat in a mold or die, with the result of producing an article of manufacture composed of a homogeneous and cohesive mass of thoroughly indurated particles, and the objects thus produced may, if desired, be polished or japanned to improve the appearance of the same." Many useful and ornamental articles are manufactured from pulp so prepared.

COMPRESSED TIMBER.—Much attention is being given of late to compressing timber. It is compressed for various uses and purposes. Compression is now largely used instead of carving, and most beautiful and artistic designs are thus brought out, in many cases fully equal, if not superior, to anything which the carver can produce. Wood is thus compressed either in its natural condition or after being steamed. The hardest, well-seasoned ash timber, say four inches thick, can be pressed into about three inches without injuring the fiber. Wood can even be "upset" the same as iron. The increased tenacity of bent and compressed wood, as compared with the same in its natural state, is something surprising. Compression is now applied to spoke tenons. The work is very simple and rapid, the tenon properly tapered and ready to drive to its place. Spokes so prepared will never become loose, and an increased strength is said to be thereby added to the wheel equal to three additional spokes.

BLACK ENAMEL FOR WOOD.—The following recipe will prove of value to cabinet makers: Prime the wood with linseed oil, turpentine and white lead; then give it two or three coats of black, mixed with copal varnish and turpentine; rub it down dry with pumice stone and water; finally varnish with copal. Again rub down and polish with oil and rotten stone, to obtain a perfect smoothness.

ELECTRICITY.

Electrical Literature and Progress.

The rapid increase of electrical literature presents a remarkable and one of the most significant facts connected with the industrial progress of the day. A prominent electrical inventor recently remarked that about 20 years ago he had one of the largest electrical libraries in the United States. It consisted of five small volumes! One of the recent issues of the *Electrical Review* of New York contained a list of no less than 400 volumes of electrical books, which are now offered for sale in the bookstores of that city. Of course, all the books extant on that subject would scarcely be found in a single advertised list of such publications. Another significant fact in this connection is the great number of serial publications devoted to the subject of electricity. We have upon our table a greater number of exchanges exclusively devoted to that subject than are to be found devoted to any other industry or industrial subject known to the world.

Another significant fact is found in the large amount of attention which is now being paid to electricity by the general press throughout the country. The daily press of our leading cities, until quite recently, has, as a general thing, devoted a large share of its efforts to discouraging the growing zeal manifested by the public in regard to the practical value of this new factor in science and in industrial and commercial progress. Take, for instance, the daily press of New York City, which, until quite recently, as manifested by the character of their writings upon the subject, knew but very little or nothing upon the subject. We find that great "third estate" in influence

and power devoting all its energy in this direction to stemming the tide of the almost universal efforts of the technical and outside press to encourage the more general introduction of electricity as a substitute for gas in lighting, for a distributor of power for minor industrial enterprises, for traction on street railroads, etc.

But the solid facts of actual success, and the evident determination of the great body of the people that the wheels of progress shall not be hindered by the mouthpieces of capital and monopoly, has recently worked a wonderful change in the utterances of our metropolitan cotemporaries, and we gladly hail their present efforts to put themselves in line with the "more advanced journalism" of the technical press and of those whose eyes are never blinded with the dollars and cents of wealthy and influential patrons. Henceforward we trust that the startling headlines about the "deadly trolley" and the cartoons of exaggerated accidents will be left to the fruitful imaginations of such journals as derive their chief support from articles of a purely sensational character.

A year ago it was difficult to foresee whether our local authorities meant to undertake electric lighting in earnest or were merely dallying with the question in order to keep others from dealing with it. At the close of 1891, however, there can be but little doubt that municipal electric lighting has come to stay. In the meantime, the work of revolutionizing our various industries by the subtle agent which is just now so intensely occupying the minds of the most progressive and deep-thinking scientists and inventors among us, will still go on overcoming obstacle after obstacle until that which still appears wholly Utopian to the many will open out into the most perfect and simple reality—for of such is the destiny of progress.

ANOTHER SUBURBAN ELECTRIC RAILWAY.—The Pennsylvania Railroad Company is one of the most progressive and business-like railroad companies in the country. That company, with ample experience and capital, never undertakes any radical improvement without due study and experiment, where the latter is within reach. Soon after the application of electricity as a railroad motor became the general talk, the company applied the principle to a street railway belonging to them in Atlantic City. That road has now been in operation about three years, and that it has been fully proven practicable and economical is shown by the preparations which the company is now making to apply the system to an extensive suburban railroad between New York and Jersey City. Considering the character of the company, and its proposed application of the system in a new and more extensive quarter, the act may be regarded as one of the most suggestive innovations yet made for the electric motor. The route is level and straight, and will therefore admit of the highest speed attainable under the present condition of electric science. The system decided upon is that of dispatching cars either single or in twos at frequent intervals, as against the steam practice of making up long trains to be drawn by a single motor. This new road is to parallel their present road over the route indicated, and to relieve it of its heavy duty of short hauls, which will be vastly increased during and after the coming Chicago exposition. The necessity for this relief will be fully appreciated by the public, with the knowledge that the company proposes during the exposition to start hourly trains during the daytime from New York to Chicago. The enterprise will have an additional value from an engineering standpoint, from the fact that it will be the only road paralleling a steam road and upon the same grade, by which a perfect comparative test between steam and electricity can be made.

ELECTRICITY seems destined to invade the entire field of human activity. It has long been indispensable to the scientist. It goes without saying that the time is rapidly approaching when it will be found indispensable in all productive industries, whether in the shop, in the factory or on the farm, and in transportation, whether on land or water. It has already become fully established in the laboratory and in general medical practice. It is now moving toward "annexes" in the various specialties of medicine and surgery. Its latest move in that direction was into the field of optics, where it has come to stay, as well as into the dissimilar field of thermotics.

The slender vibrations of this wonderful agent of modern progress, to which attention of electricians is now being called, seems to be revealing the most bewildering possibilities in the way of telegraphing without wires, posts or cables, and with but a very few of the present cumbersome and costly appliances which have hitherto been re-

quired. It may be said in truth that the marvels of the future are fairly beyond any present imagination. The time appears to be really coming, which, as Dean Swift in a moment of wild imagination once observed, may be too fast for human endurance. Truly, already sufficient for this generation are the wonders thereof.

CHEAP TELEPHONES.—The day is fast approaching when it will be possible to make telephoning so cheap that the use and ownership of a telephone will be within the reach of almost everyone. A new system has already been introduced in Stockholm, by a new company, which charges only \$2.75 a year for the instrument and less than two cents for each telephonic message. In England the National Telephone Co.'s. patents having expired, many private firms have sprung up, which are installing central offices, and putting up private lines. Great strides are also being made in perfecting systems of communication. Such progress has already been made as will enable anyone to speak direct to another in the different rooms of a large house without having first to "ring up," and be "switched on," as is required by the systems heretofore in use. The cost of this system is very small, and can be put up in private houses for about the cost for placing electric bells. These instruments, it is claimed, will work at any distance within three miles. Cheap telephones will soon be available in this country as well as in Europe.

ELECTRICITY ON CANALS.—The canal boat drawn by horses did well, and was a decided improvement on horse traction over common roads, as employed 50 years ago. The canal boat propelled by steam, has shown much better results than the horse system, on the Erie canal during the last few years. But now that electricity has proven such a success on road motors, it is proposed to try it on canals also. Ex-Assemblyman Hickman, of Buffalo, has expressed his opinion on the subject as follows:—"With an 'up' wire and a 'down' wire, boats can be moved easily and cheaply. The room necessary for an electric motor is small and no fuel room is required. The weight of the motor is also small, comparatively speaking. One boat could tow another and the cost of transportation be so reduced that, even with low freights, boatmen could live. I believe this would be profitable with the present method of generating electricity, but if the Niagara Falls power scheme should prove a success, there would be a splendid return on the investment."

ELECTRIC RAILWAYS ON COUNTY ROADS, may soon accomplish a solution of the "road question." Such an idea is not so very unreasonable when we consider the progress that has been made in this direction during the last three or four years. The construction of electric roads, with their light motors and cars, is a very inexpensive affair when compared to steam road constructions over soft soil and level ground in farming districts where they are so especially needed. The conditions which are so unfavorable to the construction and maintenance of good farm roads for heavy traffic seem to invite cheap and light electric railways. It is quite within even the probabilities that before the expiration of the present decade the farmers throughout the broad prairies of the West and those occupying the great level valley near the Pacific Coast will be sending the bulk of their produce to market speedily over electric roads, at one-quarter the present cost of transporting them through rough and muddy common roads, by horse power.

AN ELECTRICAL MUTUAL FIRE INSURANCE COMPANY which has been doing quite a successful business in Boston, has turned over all its business to the N. Y. Home Insurance Co. This step has been taken in consequence of the great losses by fires during 1891, by which a large number of the minor companies have been brought to grief. The New York company with its ten millions of capital, has established a special department for losses from fires caused by electricity.

BIG FLOUR MILLS TO BE RUN BY ELECTRICITY.—Mention was made last week of the fact that what is to be one of the largest flour mills in the country is now in process of erection at St. Paul, which is to be run by electricity generated from a neighboring water power. We have since noticed that another immense mill is in process of construction at St. Louis, which is also to be run by electricity. The world keeps moving.

ELECTRICAL UTILIZATION OF WATER POWER.—A prize is offered by the Societe des Eaux et de la Dranse, in Switzerland,

for the best system for the electrical utilization of a fall of water. Particulars of the competition may be had from the Secretary of the Societe des Ingenieurs Civils, of Paris.

WOOD HEALTH.

How to Maintain Health.

It so often comes in the way of duty, as we regard it, to criticize the acts and policy pursued by the medical faculty of this city, that it is a real pleasure to offer a word of commendation, when the opportunity for so doing is presented. Such an opportunity is presented in speaking of the efforts of the managers of the Cooper Medical Institute, to impart general and valuable information in regard to health and how to preserve it, by the institution of regular annual courses of lectures at their hall on Webster street. It has been both pleasurable and profitable to the writer to attend these lectures from time to time. They are free to the public and are given monthly by the leading practitioners of this city, and are well worthy of being fully attended. Our present purpose is to make special reference to the last lecture, given by Dr. William Cushing, and reported for the *Call*, on

CIVILIZATION AS A CAUSE OF DISEASE.

The doctor maintained that to live in accord with the present idea of civilization it is impossible to conform to the laws of health; hence civilization and health are not cordial in their relations. The chief aim of study in the past has been to cure disease that has taken such fearful hold of civilization; the study of the future will be to prevent disease. The best means to that end will be to properly educate the people.

One of the greatest sources of evil in civilization is the use of stimulants; it has indeed come to be regarded as necessary. As a scientific fact, however, stimulants are not necessary.

No beverage in use is so hurtful as tea, particularly to women. It excites and shocks the nervous system and results finally in prostration. The tannin in tea is a poison that only serves to impede all the natural functions. Coffee is much less hurtful because it interferes less with nutrition.

ALCOHOL HURTFUL.

Alcohol is had in its concentrated form and the primary cause of a great many disorders. In its lighter forms it is less hurtful, and in some forms even beneficial if properly used. As it exists in malt and light wines it is an aid to nutrition and prevents the waste of tissue. The study of civilization should then be to learn the proper use of alcohol.

Tobacco has no redeeming qualities; it is had from beginning to end, and absolutely no good comes from its use. It impairs to a greater or less extent all the senses; but its chief evil is its hurtful influence on the heart and brain. It is particularly injurious when taken into the immature system. If people are determined to use it, the effect would be much less hurtful by waiting till after they are 21 years old.

Overeating is a dreadful vice of civilization. It takes into the system an excess of material that cannot be thrown off, and the inevitable consequence is the turning of that into poison, the chief agency of disease. People eat too much meat, too many varieties of food and too much trash, which moves in genteel society under the alias of "pastries." Meat once a day is usually enough for any one, and there is no better specimen of health than the ruddy German, who is glad to get it twice a week. Too much food results in fatty degeneration.

EATING TOO FAST.

An evil hardly less hurtful than overeating is fast eating. This, too, is one of the pernicious products of civilization. People not only eat too fast, but they live too fast, and the extra energy they expend is taken off the end of life.

The fast living of civilization causes riot among all the natural functions. The nervous system becomes irritated and weakened till it can no longer resist fatigue. Then disease takes hold.

Contagious diseases are peculiar to civilization. Consumption, scarlet fever, typhoid fever, cholera, smallpox and others, all contagious, are rare among the aborigines. They are in the great majority of cases the result of drinking impure water.

The cure of all this is the education of the people. Every school in the land should have one or more competent teachers of hygiene. For every dollar spent in building schools a like amount should be spent in providing proper means of physical training.

SUDDEN DEATHS.—It is claimed that eight men die suddenly to one such death among women.

Passing Events.

The Anti-Debris Association seeing that the Miners' Association has issued a request to hydraulic miners to cease illegal operations until Congress can take action, has agreed to withdraw its watchmen now in the field. This is a most important step and one which will largely prevent friction, and bring about a better feeling between miners and farmers.

At Marysville, a petition was presented to the supervisors, asking them to donate \$600 toward paying the expenses of the Miners' Association delegates to Washington. The board allowed \$300 and the rest will be raised by subscription. This action, and that of the Anti-Debris Association, shows some of the good results accomplished by the recent convention toward a settlement of the long-continued controversy.

The action of the Board of Supervisors of San Francisco, referred to in another column, is greatly to be regretted, and makes this city look very "small" indeed. The idea that this great city cannot lend finan-

cial aid to a movement of such importance to its citizens and the entire State, seems almost absurd.

The proceedings of the River Improvement Convention Committee and those of the Executive Committee of the California Miners' Association, printed elsewhere in the PRESS, should be read by all miners, as they are very important, tending as they do toward a friendly settlement of the debris question.

Not One Idea Only.

Our friend Mr. Paul favors us with a communication on the subject of "The Two Conventions," in which he compares that of Denver with the one recently held here, saying that the San Francisco, unlike the Denver, was strictly "a one idea meeting." We happen to know from the California man who sent us the account of the Denver Convention that, outside of the silver question just 58 minutes in all was devoted to consideration of other subjects, lands, railroads, hydraulic mines and everything else. Knowing this fact, and having also read the proceedings, it does not seem that the Denver Convention went much outside of one idea after all. True, it adopted a hydraulic mining resolution—for which we are grateful—but it could not well do otherwise with a California man as its chairman and a California mining delegation present.

Mr. Paul says that in our State Convention "the land question was not touched in the proper spirit; railroad claims to mineral lands was given the go-by, and the silver question was ruled out." Mr. Paul is mistaken. The land question was touched upon to suit the convention, if not individuals; the railroad and mineral land question was referred to a proper committee; no silver resolution was ruled out because none was properly introduced. Those interested in the latter subject did not come before the convention with any resolutions, although the matter was talked of outside. It was perfectly competent for any delegate to bring up this or any other subject, if he cared to do so, and it would doubtless have received consideration.

As to silver, at Denver they had prepared themselves on the subject, and presented it elaborately to Congress, much better than it could have been done by a convention composed almost wholly of gold miners.

Mr. Paul infers that we had a lash over our heads in San Francisco, and did not dare to talk emphatically. He should be informed that the railroad grant matter, the drift mine subject, that of agricultural and mineral claimants, that of paying mineral, and others relating to legal matters, were by resolution referred to a special committee for more mature deliberation. Resolutions on these subjects were all drawn up, we are sure, since the writer of these paragraphs was one of those who devoted much time to their preparation. But it was thought best to refer them all to a competent committee, with legal knowledge, rather than take up time in discussing subjects requiring more thought and time than a convention could give them.

It is true that most of the work of the convention was devoted to the hydraulic mining question. But this is the most important one we have in California to-day. Except in the Klamath region, these mines have been practically closed for years. If, as Mr. Paul says, California only produces \$10,000,000 this year from all its gold mines; and if, as the hydraulic miners claim, the hydraulic mines can turn out \$10,000,000 a year; why then measures that will start them up will double our gold product at once. No other one thing could do this, that we are aware of. The quartz men are getting on fairly well, and their grievances are now under consideration by a special committee and will be brought to the attention of Congress at once.

As to Mr. Paul's expressed views about

the miner asserting his right and independence; standing square on his own feet; not admitting valley people into the State Councils, the tirades of the granger, etc. there is this to say: A few more besides Mr. Paul, who have been 40 years among the rocks, had these same ideas. If they had been impressed upon the convention, not one single thing would have been accomplished for the benefit of the hydraulic mines; there would have been no harmony, no concert of action between formerly-contending factions; no concessions on either side, nothing but a stirring up of old controveries; opposing interests contending before Congress; no results.

But, happily, what we consider wiser measures were adopted. The farmer, standing there with the law on his side, was invited to help, to cooperate and to advance plans for the miners' and his own benefit. Conferences were held, concessions made on both sides, and an amicable course of action carried out. Within a week the miners were asked by their own backers to stop illegal mining; the antidebris spies were withdrawn from the field, two committees of farmers and miners go to Congress with a common object; money to help the cause comes on; for the first time in years there is peace and unity of action; the press and the public give their assistance to the cause to which they had formerly been opposed.

All this has been accomplished by the course of action of the convention. Some men will hang back on both sides and refuse to join the love-feast, but most of them have that 40-year rock solidity—with some little moss naturally.

There was, once upon a time, a fight by another Miners' Association on this very question, carried out on the lines indicated by Mr. Paul. How that came out is a matter of history. It is not worth while to discuss it, but the results were such that the hydraulic miners are very glad to try "a new tack." And they are trying it.

Comply with the Law.

On pages 94 and 95 of this number of the PRESS are given the resolutions adopted by the California Miners' Association and the Committees of the River Improvement and Miners' Convention, requesting hydraulic miners to desist from any illegal mining until Congress can act on the mining debris question.

These resolutions were but the natural result of the action of the recent Mining Convention. They serve to prove the good faith of the new association, and to give notice to miners that the laws must be obeyed if hydraulic mining is to be rehabilitated.

There should not be any question on the part of hydraulic miners about complying with this request. Individuals cannot afford to fight this matter. If anything is to be accomplished in Congress, only an association of miners can do it. But the delegates to Congress from such an association will be placed in a very awkward position if, after they have pledged good faith, word comes on there that faith is being broken.

Neither the Miners' Association nor the mining press of the State can afford, or has any desire, to defend any man who, under the circumstances, continues operations after having been notified to desist. There can be no half-way measures in this matter at all. The issue is a square one and must be met. If miners care to go on and do as they please, they can expect no aid or countenance from the association.

Already the adoption of these resolutions has had a good effect. On Tuesday of this week, at Marysville, the directors of the Anti-Debris Association resolved that the Miners' Association, through their Executive Committee, have issued a request to hydraulic miners to cease operations until Congress shall take action whereby that class of mining can be resumed without injury to valley lands or navigable streams, the association having confidence in their good faith, deem it no longer necessary to have their watchmen in the field, and will withdraw them so long as the rivers show no evidence of a continuation or resumption of that class of mining.

The miners are placed on their honor in this matter. It only remains for the individuals to cooperate with the association to see the whole thing settled in due time and the mines go ahead legally. The withdrawal of the "spies" is a graceful act on the part of the Anti-Debris Association and an acknowledgment that they believe the Miners' Association is acting in good faith.

Mr. Ohleyer's Position.

Mr. George Ohleyer of Sutter county, well known to the miners of this State as one of the foremost leaders of the Anti-Debris Association, went from this city to Washington immediately after the Miners' Convention adjourned and before the meeting of the Executive Committees of the River Improvement Convention and California Miners' Association. This action has occasioned some adverse comment, because it was supposed that his prejudices would lead him to perhaps undo to some extent the good work accomplished by the friendly adjustment of matters previously in controversy.

In justice to Mr. Ohleyer, and to all concerned, it should be stated that he is not a delegate to Washington for the Anti-Debris Association—that Association is not sending any delegates—and Mr. Ohleyer is no longer drawing any salary from County Supervisors. He goes as a delegate of Sutter county from the River Improvement Convention to urge appropriations for improving the rivers. His expenses are paid by his county, just as Sacramento and San Joaquin pay expenses of their respective delegates. They were anxious to be in Washington as early as possible, and it happened that Mr. Ohleyer was enabled to go first. Since his departure the other delegates have gone, and in a few days the Miners' Convention delegates will also start.

The respective committees of the Miners' and the River Improvement Conventions came to an amicable agreement at their conference, and agreed to work together on a certain basis. This fact has been communicated to Mr. Ohleyer by telegraph and it is not likely, under the circumstances, that the gentleman will take any steps contrary to the wishes of the body which sent him on his mission. There need be no uneasiness, therefore, on the miners part, because Mr. Ohleyer is first on the ground. In fact, perhaps he is fairer-minded than he has been given credit for. At the Executive Committee of the River Improvement Committee meeting, some weeks since, Mr. J. B. Hobson introduced a resolution to the effect that they were not opposed to hydraulic mining, provided it would be carried on without detriment to other interests. To his surprise, it must be confessed, Mr. Ohleyer was one of the few who favored this and called it up. It was defeated eventually, but Mr. George Ohleyer was for it. He is a man of strong prejudices, and is a battle-scarred veteran—in a hydraulic sense—but will doubtless act, like the rest of his delegation, under the agreement adopted.

A Contrast.

The supervisors of Yuba county, at a meeting at Marysville, have appropriated \$300 toward paying the expenses of the delegates to Washington appointed by the Miners' Convention, and \$300 more will be raised by subscription; they gave the same amount to the delegates of the River Improvement Convention. This is one of the happy results of the amicable agreement between farmers and miners, brought about by the Miners' Convention. It will surprise many miners to think that any money could come out of Marysville—the antidebris headquarters—for such a purpose, and the supervisors of Yuba county are to be congratulated for their good sense in furthering the object by moral and financial aid.

In strong contrast to this is the action of the San Francisco Supervisors, who were also asked to aid the Miners' Committee. At a special meeting on Monday afternoon, a communication was read from the California Miners' Association setting forth the advantages of the resumption of hydraulic mining to this city and the State, and the Supervisors voted \$1000 toward defraying the expenses of the Miners' Committee to Washington. At the evening session of the same body on the same day, they voted not to give the \$1000, and declined to give anything at all. They had already given \$200 to the River Improvement Convention Committee to Washington. Gold from the mines has been pouring into San Francisco for 40 years and more, and this is the first time the city has ever been asked to do anything for the mines. We feel so ashamed of this action that we do not care to discuss it,

Good Air-Compressor Work.

The indicator cards illustrated herewith were taken from a vertical duplex air-compressor 16 inches diameter and 20 inches stroke, having a forged steel crank shaft

Timbering in Clay and Quicksand.

If the reader will turn back in his file of the MINING AND SCIENTIFIC PRESS to pages 61 and 62, Jan. 23, 1892, some examples will there be seen of methods of

widened out, the arch was carried to 778 + 05, and the invert and side walls to + 08, or the edge of the soft ground. The extent to which it had been honey-combed by successive drifts is shown in the engravings. Fig. 1 is a section showing drift No. 3,

subject of "Heredity in its relation to the inheritance of acquired character."

The Knight Water Wheel.

Over 20 years ago Mr. Knight, in common with others, made water wheels entirely out of wood. The buckets were shaped like saw teeth, and wooden flanges covered the sides of the buckets to confine the water. A round nozzle was used, and the general results were considered at the time very satisfactory. Then the wooden wheel was given iron buckets, a curve being given to the buckets so the water would be discharged toward the center. A few years later Mr. Knight made an improvement by using a curved iron bucket and having the discharge toward the center and to one side. After continued experiments with the round nozzle he found it did not fill the general requirements; he could not cover enough bucket space along the periphery of the wheel, without covering an equal space in the width of the bucket, by increasing the diameter of the round nozzle.

This induced him to try an elliptical or oblong nozzle, and the first wheel of this character was placed in the Lamphear mine, at Mokelumne Hill; it was quickly followed by two others, so satisfactorily did they work. From these wheels sprang the present Knight Water Wheel, for here it was he conceived the idea of abandoning entirely any direct modification of the round nozzle, and the opening was made in the form of a narrow rectangular slit. The round nozzle did well enough where small quantities of water were used, but upon using considerable water the nozzle became so large that while the upper edge could be brought near the wheel the lower edge was far away, and Mr. Knight was of the opinion that this reduced the power materially, so the slit was determined upon. More than one nozzle was also tried but it did not prove satisfactory.

In 1875 the first wheel of the present style was placed in the Lincoln mine, Sutter Creek, Amador county, and from that time various improvements have been made in the size and arrangement of the slits in the nozzle and shape of the buckets, until the wheel assumed the improved form shown in the engraving. For general utility and economy its features are recognized, and it is largely in use, especially among the mining regions.

The following paragraph from a recent number of *Industry* shows the advantage of this wheel as applied to an electrical plant: "We, last month, mentioned an open turbine wheel of 100 horse power, made by Messrs. Knight & Co. of Sutter Creek, Amador county, to operate under the low head of 27 feet, for an electrical plant at Yreka, Cal. This wheel has since then been started, and the superintendent, Mr. James Quinne, writes that its performance is a surprise, claiming that Mr. Knight himself does not appreciate the advantages of the system, and sets down the power developed at 20 per cent over the estimate for capacity. We are getting ready to make a prediction before long, respecting open or tangential turbines *versus* enclosed or pressure ones, and the part they will play in the near future. It may seem like going back to old ideas, and if so, it will not be the first time we have had to do so. Imagine one of the refined Jonval or Fourneyron wheels out of its casing, throwing that away, and set the wheel up in open view, stripped of more than half its details, and after all getting more work out of it."

It may be stated, with reference to the above, that Mr. Quinne received bids from the principal wheel makers in the United States, and Mr. Knight's guarantee was 6 horse power more than the highest of the others. This guarantee was 100 horse power with 2500 cubic feet of water per minute. According to Mr. Quinne's statement, the wheel ran to 125 horse power.

CARDS FROM THE NEW 16X20 DUPLEX AIR COMPRESSOR OF THE KEYSTONE MINING COMPANY.

six inches in diameter. The cards show over 70 horse power when the compressor is making 52 revolutions per minute. The indicator spring was 40 scale. The compressor is driven by a water wheel four feet in diameter, having two nozzles each 1 64-

cribbing, drifting and timbering in the bad ground encountered on the line of the Croton aqueduct. So bad was this ground at one place that after hard work under several plans the arch reached a point 18 feet short of where the heading had been

and Fig. 2 shows the successive drifts in bad ground, shaft 13, south heading. In the next number of the PRESS will be shown the steps taken for the successful advance of the drift by the English method.

FIG. 1.—SECTION SHOWING DRIFT NO. 3.

FIG. 2.—SUCCESSIVE DRIFTS IN BAD GROUND, SHAFT 13 SOUTH HEADING.

100 inches in diameter. The water pressure was 120 pounds per square inch, equal to a head of 277 feet. The amount of water used was less than 140 miner's inches, Amador Canal Co's. measurement which is 14-10 cubic feet per miner's inch. This air-compressor was built by W. T. Garratt & Co. of this city, for the Keystone Cons. Mining Co. of Amador county.

nearly a year before. During the next four months the following drifts were run: Drift No. 3, east side at grade, nine weeks, 27 feet to + 22; drift No. 4, top center, one week, 8 feet to + 13; drift No. 5, center of grade, 6 weeks, 24 feet to + 32. These drifts are shown in the accompanying engravings. The drifts were no more successful than the others; however, they were

THE museum of the California Academy of Sciences in this city is now open daily, and it has been resolved to keep it open on Sundays from 10 o'clock till 4 o'clock, commencing on the 7th inst.

The Two Conventions.

MIDDLE CREEK, Shasta Co., Feb. 2, '92.

TO THE EDITOR:—As a delegate to the National Mining Congress held in Denver, Colo., in November last, and also to the Miners' Convention held in San Francisco, January, 1892, I feel licensed to say something in regard to both.

The San Francisco Convention, unlike the Denver, was strictly a one idea meeting, and as such it fell short of what a California State Convention should be. The land question it did not touch in the spirit it should have done. Railroad claim to mineral lands was given the go by, and what more vital question to the mass of miners is there? The silver question also was ruled out, and is not this also a vital question to the mining interest—the miner?

California miners may not be so much interested in the silver question as those of Nevada, Utah or Colorado, but is that any reason why they should not seek to help along their fellow miner who extracts the white metal?

The Denver Convention put forth and passed every line of several resolutions in the interest of hydraulic mining, as prepared by the California delegation, and they have no hydraulic mining. The land question, as it affected every mining State, received also marked attention.

Take the Denver Convention as a whole, it exceeded in broad-minded work and independence of action that of California. They had no lash over their heads and dared to talk emphatically on railroad land grants, hydraulic mining or silver coinage.

Our convention, as a one-idea one, was a grand success—a pleasing one. The lion and the lamb laid down together—in fact, jumped into the same bed—and almost caressed each other, which would have been very touching had there not been some political futures in it.

For one I am free to say that I felt somewhat disappointed in the limited line of action of our California convention, considering so many mining men, from every section, had gathered together for the first time; and I am not alone in this. A State Miners' Convention should not be a one idea affair at all. Miners are not confined to one class or kind of mining. When men expend their time and money, it should be for something more than to vote yes for sustaining a single branch.

Another objectionable feature presents itself to my mind, and it is this: As a State Miners' Association why do we organize in it every valley county? As far as the late convention and hydraulic question went this was well enough and strictly proper, but there affiliation with the granger should have stopped. They don't admit the miner into their State councils. A State Miners' Association should be composed of the mining counties only, or I will say only of miners; and this I think will be the sentiment of every mining county association organized or to be organized. I don't want to be captious, but the fact is, that having been for over 40 years so much among the rocks, I have gotten a little of their solidity ground into my bones, and I want to see the miner assert his right and independence enough to stand square on his own feet. The tirades of the granger against the hydraulic interest have seriously injured every class of business, and even crippled themselves, and for one I don't propose to jump into bed with them and hug their short-sightedness so dearly.

Last year we produced \$10,000,000. The great mining State of California producing only \$10,000,000! This is a good figure for an individual bank account, but as a gold output for California nothing so clearly illustrates the damage done to the gold mining industry. Why, the little district about Johannesburg (South Africa) produced \$13,250,000 for 1891.

As the prospects now are that this war between the farmer and hydraulic miner is over, let us hope that the incoming of capital will increase and our gold output along with it.

For one I would like to see at some future day a State Miners' Convention for the discussion of subjects pertaining to gold and silver mining, the advancement of the several branches, as electrical applications, new explosives, new mechanical devices, new systems, and new ideas generally. In such a meeting every delegate might return to his home carrying new and valuable information received from others in an exchange of ideas.

In making these criticisms I do not want to be considered an enemy to hydraulic mining. On the contrary, for I am one of those ruined by the grangers fight against it, and no one in the State has written and published more in its behalf than your humble servant.

ALMARIN B. PAUL.

Bullion Product of 1891.

We are indebted to John J. Valentine, Vice-President and General Manager of Wells, Fargo & Co.'s Express, for the following copy of his annual report of precious metals produced on the Pacific Slope:

The following is our annual report of precious metals produced in the States and Territories west of the Missouri river (including British Columbia) during 1891, which shows in the aggregate: Gold, \$31,975,994; Silver, \$60,614,004; Copper, \$13,261,663; Lead, \$12,385,780. Total gross result, \$118,237,441. The "commercial" value at which the several metals named herein have been estimated is: Silver, 98 cents per oz; Copper, 11 cents per lb; and Lead, \$4.30 per cwt.

As in former reports, allowance must be made for probable variations from exact figures, by reason of constantly increasing facilities for transporting bullion, ores and base metals from the mines outside of the express, and the difficulty of getting entirely reliable data from private sources. Especially is such the case in the reports from Montana and Colorado; in fact, we have estimated the amount credited to Montana. Statistics gathered in this way are liable to be exaggerated; but with some modifications on this account made herein the final general results reached, while only approximately correct, may be accepted as the closest approximation possible under the circumstances. No bullion or coin received by Wells, Fargo & Co.'s Express from the west coast of Mexico during 1891.

STATES AND TERRITORIES.	Gold dust and bullion by express.	Gold dust and bullion by other conveyances.	Silver bullion by express.	Ores and base bullion by freight.	Total

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING JAN. 26, 1892.

- 467,681.—MAIL BAG—C. Dickenson, Portland, Or.
 467,882.—CAR COUPLING—F. A. Fox, S. F.
 467,607.—ROTARY EXCAVATOR—W. P. Humphreys, S. F.
 467,685.—EXTENSION LADDER—E. W. Hammon, Medford, Or.
 467,687.—FRUIT GATHERER—D. B. Matlock, San Jose, Cal.
 467,620.—DISH WASHER—W. C. Nelson, Santa Rosa, Cal.
 467,612.—HYDRAULIC MOTOR—E. I. Nichols, S. F.
 467,772.—DUMP CAR—C. D. Page, Tacoma, Wash.
 467,614.—CAR COUPLING—David Stark, S. F.
 467,696.—FLASH-LIGHT BURNER—S. M. Williams, S. F.

The following brief list by telegraph, for Feb. 2d, will set more complete on receipt of mail advices: Mark Anthony, Berkeley, and W. C. Savage, Oakland, Cal., thimble and bushing for barrels, G. W. Bedbury and E. F. Badgley, San Francisco, pile armor and casing; Edgar M. Bredwell, McMinnville, Oregon, anti-friction axle-box; Henry Bryan, Modesto, Cal., grato-cleaner attachment; Columbus F. Cardwell, Bridal Veil Oregon, door securer; James A. Christy, San Francisco, Cal., telephone holder; Gilbert T. Franklin, Walla Walla, Wash., gravel-screening machine; Alexis Janin, San Francisco, Cal., amalgamating silver ores; Charles J. Koefoed, San Francisco, band-saw mill; William F. Loan, Portland, Oregon, holders for brushes and dusters; Henry C. Lynch, Sao Francisco, Cal., cable-grip adjusting device; David R. McKim, Gold Hill, Nev., valve; Dennis O. Sullivan, Spokane Falls, Wash., sling cinch; Robert W. Parker, Camp Huachuca, Ariz., rite sight; Emilio Brunetti and G. Avigdon, Sierra City, Cal., aerial tramway; Fairfax H. Wheelan, Santa Barbara, Cal., separator; Henry G. Gates, San Francisco, ball-bearing device.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraph order. American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and to the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

FRUIT GATHERER.—David B. Matlock, San Jose, No. 467,687. Dated Jan. 26, 1892. This improved device for gathering fruit consists of a case or receptacle supported above the end of a pole or standard, and having a flexible self-adjusting bottom to receive the fruit, and a device consisting of a semicircular shears mounted above the top of the receptacle in such a manner that the stems of any fruit would be sheared off between the cutting blades at any point around the circumference, with a means for supporting said blades.

EXTENSION AND STEPLADDER.—E. M. Hammon, Medford, Oregon, No. 467,685. Dated Jan. 26, 1892. This consists in the combination of parts forming a stepladder and supports therefor, and a means whereby the ladder may be converted into an extension ladder with suitable strengthening and locking devices.

AUTOMATIC CUT-OFF FOR GAS BURNERS.—James E. Hogaz, Oakland, No. 467,287. Dated Jan. 19, 1892. This electric safety attachment for gas burners is intended to provide a supplemental means for cutting off the flow of gas in case the usual key is accidentally turned or left open after the light has been extinguished.

PNEUMATIC CLUTCH.—Byron Jennings, San Jose, assignor of one-half to James Brusie, Oakland, No. 467,288. Dated Jan. 19, 1892. This improved clutch is specially designed to be used upon rotary machinery, in which one portion is to be kept constantly running, while the other portion is subject to stops, without arresting the motion of the other portion. It consists of a pneumatically expandable tube or collar fitting between the adjacent faces of the two portions of the machinery so that when in its normal condition and unexpanded, it allows one portion to turn without communicating motion to the other; but when expanded, it produces such frictional contact between these adjacent faces that motion is communicated from the constantly moving part to the other. The weight of an operative electrical motor is very considerable, and when employed to propel cars or other machinery where frequent stops are to be made, the power lost in constantly stopping and starting the motor is very considerable. For this reason, it is desirable to allow the motor when once started to run continuously and to provide an intermediate means for stopping the machinery without stopping the motor.

HOISTING APPARATUS.—Joseph Mount and Frank H. Warnock, Spokane, Washington, No. 467,289. Dated Jan. 19, 1892. The invention relates to that class of hoisting or elevating mechanism in which endless traveling ropes, chains or cables are employed, and which carry the receptacles containing the material to be hoisted. The object of the invention is to provide a simple means for hoisting material of any kind, but more particularly for elevating brick and mortar from the ground to any of the floors of a building in process of construction.

Assessment Notices.

GOULD & CURRY SILVER MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 5th day of January, 1892, an assessment (No. 68) of Thirty (30) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 69 Nevada Block, 303 Montgomery Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 5th day of February, 1892, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on TUESDAY, the first (1st) day of March, 1892, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

ALFRED K. DURBROW, Secretary. Office—Room 69 Nevada Block, 303 Montgomery Street, San Francisco, Cal.

SAN FRANCISCO MILLING AND MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, West Point, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 12th day of January, 1892, an assessment (No. 1) of Two (2) Cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States gold coin to the Secretary, at the office of the Company, Room 11, No. 303 California Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 15th day of February, 1892, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on TUESDAY, the 5th day of March, 1892, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

CHAS. H. OSBORN, Secretary. Office, Room 11, No. 303 California Street, San Francisco, California.

GRAY EAGLE MINING COMPANY.—LOCATION OF principal place of business, San Francisco, California. Location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of January, 1892, an assessment (No. 27) of Six (6) Cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room 11, No. 303 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of February, 1892, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 7th day of March, 1892, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

A. W. BARROWE, Secretary. Office, Room 11, No. 303 California Street, San Francisco, California.

CALIFORNIA VERDE ANTIQUE MARBLE COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2d day of January, 1892, an assessment (No. 2) of One (1) Cent per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin, to the Secretary, at the office of the Company, 303 Pine Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the seventh (7th) day of March, 1892, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 15th day of March, 1892, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

W. J. GURNETT, Secretary. Office, 303 Pine Street, San Francisco, California.

KEYSTONE CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, Amador City, Amador Co., Cal.

Notice is hereby given that at a meeting of the Board of Directors, held on Saturday, the 30th day of January, 1892, an assessment (No. 2) of Two Dollars and Fifty Cents (\$2.50) per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the Company, No. 310 Pine St., room 43, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of March, 1892, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 5th day of March, 1892, to pay the delinquent assessment together with costs of advertising and expenses of sale. By order of the Board of Directors.

H. H. ISHAM, Secretary. Office, No. 310 Pine St., Room 43, San Francisco, Cal.

Advertisement for Proposals!

TUNNEL.

SEALED PROPOSALS WILL BE RECEIVED BY THE Directors of the Bear Valley Irrigation Company at Redlands, California, until March 1st, 1892, for the construction of a Tunnel about 600 feet in length through rock, in accordance with the plans and specifications on file in the office of the undersigned. Bidders may propose to furnish their own plant, or to use a complete power-drilling, hauling and ventilating plant to be furnished by the Company. Each bid must be accompanied by a certified check for not less than 2% of the amount of the proposal. The Directors reserve the right to reject any or all proposals. EDWARD M. BOGOS, Engineer, Banning, California.

HORACE D. RANLETT,

Ores, Mining, and Commission,

420 Montgomery St., S. F.
 Ships under advances to smelting works in Boston New York, Baltimore and Liverpool.
 Twenty-one years' experience in Shipping Ores and Managing Mines.

Solicits Consignments of Copper Produce and Management of Mining Matters.
 All business conducted on Cash Basis.

Purchase and shipment of Mining Supplies a SPECIALTY. Sales of Developed Copper Mines undertaken. General Manager of UNION COPPER MINE, Copperopolis, Cal.; NEWTON COPPER MINE, Amador Co., Cal.

DIVIDEND NOTICE.

OFFICE OF THE PACIFIC COAST BORAX COMPANY, San Francisco, January 30, 1892. At a meeting of the Board of Directors of the above-named Company, held this day, a Dividend (No. 14) of One Dollar (\$1.00) per share was declared, payable WEDNESDAY, February 10, 1892, at the office of the Company, No. 230 Montgomery St., Rooms 11 and 12. Transfer books will close February 5, 1892, at 3 o'clock, P. M.

ALTON H. CLOUGH, Secretary.

Astronomical Society of the Pacific.

The meeting was held on January 30th, by invitation, in the lecture hall of the California Academy of Sciences, 819 Market St., San Francisco. President Pierson presided.

A list of thirty-seven members was read who had been elected at the directors' meeting. Among the presents received was a finely colored lithograph of the partially eclipsed moon, drawn by Prof. Weinek of Prague, and the secretary announced that Prof. Weinek had presented 1000 copies to the society for binding in the publications.

The following papers were presented: The Rotation of the Sun (translation from the German of Dr. Schmidt), by A. C. Behr of Chicago; Pogson's Comet and the Bielau Meteors, by W. H. S. Monk of Dublin, Ireland; The McKim Observatory, by Prof. W. V. Brown of Greencastle, Indiana; When Shall we have Another Glacial Epoch?, by Garrett P. Serviss of New York City; The Total Eclipse of the Moon, January 28, 1888, by Prof. Weinek of Prague (translated by F. R. Ziel of San Francisco).

Committees to nominate a Board of Directors and Committee on Publication, and to audit the Treasurer's accounts, were appointed, to report at the Annual Meeting, to be held March 26th.

The President announced that a branch of the Society was being organized in Pittsburgh, similar to the Chicago branch.

The room was then darkened and 75 lantern slides thrown on the screen, by Prof. W. W. Campbell, illustrating the methods employed and the results obtained in stellar photography and spectroscopy at the Lick and other observatories. The exhibit of 75 lantern slides included copies of the recent photographs of the moon, Jupiter, the Nebula of Orion, and the clusters of Perseus and Hercules, made by Profs. Holden and Campbell with the 36-inch telescope; diagrams illustrating the recent investigations of Prof. Schaeberle on the photographic atmospheric absorption; the Milky Way pictures made by Prof. Barnard; pictures of the nebulae and clusters, by Mr. Isaac Roberts; and views of the recent Mt. Hamilton forest fires by Mr. Campbell.

The second part of the lecture was devoted to a detailed explanation of the methods of spectrum analysis, illustrated by diagrams, by photographs of the principal spectroscopes, and by photographs of star spectra made at Harvard College Observatory and at Potsdam. Present spectroscopic results were reviewed, and the nature of the pending spectroscopic problems explained.

The Late Humphrey Rees.

Humphrey Rees, one of the oldest and most skillful miners on the "Mother Lode," died last week at Sutter Creek, Amador county. He was a native of North Wales, aged 70 years. Mr. Rees had been a subscriber of the MINING AND SCIENTIFIC PRESS for a great many years, and was a pioneer citizen of Sutter Creek. A correspondent of the Amador Ledger speaks of him as follows: "Humphrey Rees died at 3 o'clock Sunday afternoon, after an illness of several weeks, of the grippe, aggravated by chronic asthmatic trouble. He has been identified with the mining interests of the county since early days, and was widely known throughout Amador, his many friends testifying their appreciation of his character by deeply felt regret at his removal, and universal expressions of esteem for his honesty and integrity in all the walks of life. The funeral took place Monday, and was one of the largest attended that has been witnessed here for some time, a great many from the outside towns being present. Deceased was a member of the Odd Fellows' fraternity, and the last rites were performed in accordance with the ritual of that Order, the body finding its final resting place in the Odd Fellows' cemetery. Deceased leaves two married daughters, Mrs. Jones and Mrs. Prosser. His wife preceded him to the grave three months ago."

SOME thousands of dollars have been already collected from companies and individuals in San Francisco to help the miners' cause, and an active Finance Committee is still at work.

THE Miners' Committee to Congress consists of Niles Searles, J. K. Luttrell, Robt. McMurray and J. B. Hobson. They leave next Monday for Washington.

A STRONG COMPANY has been formed in Los Angeles to develop oil wells. It is called the Rowland & Lacy Petroleum and Land Co.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, FEBRUARY 4, 1892.

General rains the past week have created a more cheerful feeling and inspires trade in general with the belief that this year California's crops will be the largest that have been harvested at any time within her history. Not only will the crops be large but the mining season promises to be extended into the summer months, owing to heavy snow deposits on the mountain ranges.

The local money market continues to rule easy, with the rate of interest in borrower's favor. This is largely due to the heavy dividends disbursed in last month. These dividends compare as follows with the same month last year:

	1891.	1892.
Banks.....	\$577,500	\$602,500
Gas Companies.....	76,750	76,000
Water Companies.....	71,500	74,500
Insurance Companies.....	77,250	46,000
Street Railroad Companies.....	10,000	18,000
Power Companies.....	28,250	27,000
Sugar Companies.....	99,000	
Mining Companies.....	295,569	233,600
Miscellaneous Companies.....	14,730	17,500

Totals.....\$1,181,189 \$1,094,900

In addition the 10 saving banks of the city disbursed their semiannual dividends on their capital stock and deposits, amounting to over \$2,000,000.

The aggregate resources of all banks in California on January 1, 1892, under the jurisdiction of the State Board of Bank Commissioners were as follows:

Commercial.....	\$126,865,294
Private.....	3,824,196
Savings.....	133,310,349
Total.....	\$263,999,839
January 1, 1891.....	246,031,488

Increase.....\$17,968,351

MEXICAN DOLLARS.—The market is slow at 7 1/2 @ 7 3/4.

QUICKSILVER.—Receipts the past week aggregate 301 flasks. The market is lower for both home and export. We are indebted to J. B. Randol for the following statement of quicksilver produced in California during the given years, flasks containing 76 2/3 lbs net:

Mines—	1889.	1890.	1891.
New Almaden.....	13,100	12,000	8,300
Napa Con.....	4,500	2,483	4,080
Bradford.....	1,874	1,250	1,824
Sulphur Bank.....	1,283	1,608	1,375
Great Eastern.....	1,345	1,046	1,759
New Idria.....	980	977	870
Atma.....	931	931	1,049
Great Western.....	556	1,384	2,066
Redington.....	812	505	442
Various.....	924	737	1,221
Totals.....	26,464	22,926	22,886

During 1891 the lowest market price was \$39.50 per flask, and the highest was \$51, or say an average of \$45.25 for the year.

SILVER.—Still lower prices were touched the past week, but toward the close a steadier feeling manifested itself. The Mint purchase not only takes the entire production of this country, but is steadily absorbing the surplus. The market going down in the face of the above, is accepted as confirmatory of the general belief of its being under strong manipulations so as to secure some large holdings abroad at low prices. We judge from the investigation now under way by the House Committee on Coinage, Weights and Measures, that the sentiment in Europe is settling strongly in favor of bimetalism; even in such strong monometal countries as Great Britain and Germany opinion is changing.

BORAX.—The market is steady at current quotations. Exports to New York by sea the past week aggregate 10,040 cts.

LEAD.—The local market is steady at unchanged quotations. The East reports a fairly steady market, notwithstanding buyers are using "foreign importation" to keep prices down. There was shipped to New York the past week 2125 cts.

COPPER.—No further changes were reported the past week. The exports by sea aggregate as follows: 20 tons dross to Liverpool and 222 tons to New York. New York mail advices, while not of an encouraging character, yet they hold out inducements for expecting better prices later on. London cables to Iron Age, Jan. 23, are as follows: "Notwithstanding good forward buying for French account and more or less covering of short accounts by the 'bear' interest, prices for copper have receded under the weight of steady pressure realized by numerous holders who were more or less alarmed over reports of expected increase in supplies from America."

TIN.—The market begins to show signs of looking for more business in the near future, but until this sets in, quotations are more or less nominal. London cables report that for plate, American inquiries are numerous, particularly for light weights and specialties, but owing to low limits of prices, only a fair business has resulted. Makers are firm. The Trefoil Co. has restarted seven and the Gwendraeth Co. five mills.

IRON.—The market continues to rule fairly strong. Higher charters abroad are in favor of holders. Iron Age says that an Eastern and a Pittsburgh mill have closed, each for about 2000 tons of ship plates for the Pacific Coast at close figures.

COAL.—Imports the past week aggregate as follows: Newcastle, N. S. W., 9181 tons; Departure Bay, 3655; Seattle, 3828, and Nanaimo, 2940. Total, 18,944 tons. The market for spot and near by cargoes continues very weak and in buyers' favor. For shipment, there are no buyers at ships asking freight rates. Buyers in view of large crop prospects for wheat in this State, do not care to take cargoes for shipment at asking prices, believing that later on ships will lower their charter rates to this cost.

Mining Share Market.

The market has held to lower prices; yet while there has been no active demand and the market has been made to look "sick," there have been evidences of steady buying by strong parties—the stock pool, mill right or outside combinations. Continued levying of assessments and no disposition being shown (outside of the Overman Mining Co.) to conform to the law requiring car sample assays of all ores milled, are creating stronger disgust with outside operators. From a careful canvass among merchants and moneyed men who have dealt in stocks, the writer is convinced that it will take something more than "star articles" to induce them to draw in outsiders, and this being the case, who can the stock pool unload on, even if they manipulate the market to higher prices? It now looks as if the only redemption for the market, is success to crown the brokers' combination to make the mining companies conform to the laws of California under which they are incorporated. General interest continues to center in the suit of M. W. Fox against the directors of the Hale and Norcross Mining Co. and as each day's trial of the case unfolds the peculiar methods adopted to have the funds or bullion of the company misappropriated,

the stronger grows the conviction that nothing short of visiting on the perpetrators the full penalties of the law, will create a reformation in mine management in the interest of all stockholders.

W. S. Hobart testified on Tuesday, Feb. 2nd, that he gave H. M. Levy one-eighth of the profits derived from the crushing of Hale and Norcross ore. As Mr. Levy got \$19.00 in one month as his share on 4800 tons it simply shows to stockholders that the mill's charge of \$7 per ton, allow them to divide in profit about half, or nearly \$3.50 per ton.

\$4000 shipment of bullion is on the way from the Peer Mining Co. The news from the Quipotoa district is that the mill is still running on Peer ore. They have started a drift in this mine 500 feet down to tap the ore found above so as to handle it more economically. From the Tuscaroras our advices are that the work on the sampling mill is being vigorously pushed. The results of the various assays made in the district is more encouraging. From the Bodie district official letters continue to report a falling off in the assay value of the ore milled by the Standard. In Mono the work is of a favorable exploring character. In Bodie, they are taking out ore from two narrow streaks on two different levels. The Bodie Miner of Jan. 29th says that the Bulwer Con mine has shown great improvement during the past month. A large body of high-grade ore has been developed and is being extracted, and the Bodie mill is kept supplied to its full capacity. The ore in the stope is all the way from 2 feet to 10 feet in width. The mill is turning out bullion of fine quality and very liberally in quantity, all of which goes to show that the Bodie mine is a most promising one. The Silver King Mining Co. reports ore extracting and sacking, which indicates that the mill will start up before the summer months pass by.

From the Comstock mines our advices are that Belcher is still taking out ore. It is held for milling. This company has made connection with Justice that admits of their taking the \$40 to \$50 ore in both New York and Great Britain. The secret work being done in the Gold Hill mines is quite important, and unless the rich ore that is being developed to the west is to be confiscated, one or more of the mines ought to pay dividends this year. Official letters from the Middle mines report an improvement on the sutro tunnel level. In Con. Virginia they are taking out some high-grade ore from a narrow streak on the 1500 level, which is being milled for milling with low-grade ores. The different levels extending downward in this mine are being opened up for better working when the management thinks it best to extract the rich ore found to the west. The joint Sierra Nevada—Union work on the 900-foot level in Union—shows an improvement, and unless work is stopped an important find is looked for. The pumping out of the Gold Hill mine is being pushed more advantageously. It is claimed that important work is being done in one or more of the mines on the drained levels.

ELECTRICAL ENGINEERING CO.,

— MANUFACTURER OF —

Dynamos and Electric Motors

FOR THE TRANSMISSION AND DISTRIBUTION OF POWER

Manufacturer of and Contractor for the installation of all kinds of

ELECTRIC APPARATUS.

The Dynamos and Motors manufactured by this Company develop the highest mechanical efficiency; they require little or no attention, are almost noiseless, and run with an entire absence of sparks at the brushes, rendering the daily trimming of brushes unnecessary.

Electric Power Apparatus for Quartz Mills, Hoisting, Pumping, Drilling, and all Mining Work, where Long Distance Transmission is desired, a Specialty.

Office and Works, 21 & 23 SPEAR ST., San Francisco, Cal., U. S. A.

IMPROVED FORM OF HYDRAULIC GIANTS.

THE ABOVE CUT ILLUSTRATES THE IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture, and which are pronounced far superior to the SINGLE-JOINTED style. The latter, however, we furnish when requested. Prices, discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent upon application.

JOSHUA HENDY MACHINE WORKS, 39 to 51 Fremont St., San Francisco.

PLACER AMALGAMATORS

Combined with Steam Shovel or Dredge.

BUCYRUS SYSTEM.

NEW METHOD OF PLACER MINING.

Saves all the Gold. Uses very little Water. Treats large quantities at Low Cost.

— BUILT SOLELY BY THE —

BUCYRUS STEAM SHOVEL AND DREDGE COMPANY,
BUCYRUS, OHIO, U. S. A.

— MANUFACTURERS OF —

Stationary and Compound Engines, Flour, Sugar, Saw
and Quartz Mill Machinery.

AMALGAMATING MACHINES, CASTINGS AND FORGINGS Of Every Description
ALL WORK TESTED AND GUARANTEED.

IMPROVED PORTABLE HOISTING ENGINES.

NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

Send for Circulars and Price List.

F. A. HUNTINGTON.

PATENT ORE FEEDER. CENTRIFUGAL ROLLER QUARTZ MILL.

This Feeder is especially designed to feed the Huntington Roller Quartz Mills; it is simple in construction, and while in motion can be easily adjusted to feed fast or slow; it has but few wearing parts and its positive movement makes it the best Ore Feeder now in use.

The Following will Explain the Above Cut:

The ore and water being fed into the mill at the hopper A, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

F. A. HUNTINGTON,

MANUFACTURER AND DEALER IN

STEAM ENGINES AND MINING MACHINERY OF EVERY DESCRIPTION.

OFFICE AND WORKS, 213 TO 219 FIRST STREET, SAN FRANCISCO, CAL.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 2000 IN ACTUAL USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

THE PELTON WATER WHEEL CO.

121-123 MAIN STREET, SAN FRANCISCO, CAL., U. S. A.

143 LIBERTY STREET, NEW YORK, U. S. A.

PELTON WATER MOTORS, Varying from the fraction of 1 up to 40 and 50-horse power, unequalled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. Address as above.

THE GATES ORE AND ROCK BREAKER.

UNLIMITED IN CAPACITY. UNEQUALLED IN EFFICIENCY, UPWARD OF 3,000 NOW IN USE. Will do more than twice the work of any other with the same cost in wear. Gives a fineness of product that increases the capacity of any mill from 25 to 40 per cent without any additional expense. THE BEST AND ONLY CRUSHER ADAPTED TO MACADAM ROAD WORK. Send for Circular.

It having come to the notice of the undersigned that their patent rights are being infringed upon, intending purchasers are hereby warned that all such infringements will be duly prosecuted. (Signed) THE PELTON WATER WHEEL CO.

THE PELTON WATER WHEEL CO. 121-123 Main Street San Francisco, General Western Agents.

IMPORTANT TO GOLD MINERS!

SILVER-PLATED AMALGAM PLATES for SAVING GOLD

In Quartz, Gravel and Placer Mining.

PRICES GREATLY REDUCED. ONLY REFINED SILVER AND BEST COPPER USED. OVER 3000 ORDERS FILLED. FIFTEEN MEDALS AWARDED. Old Mining Plates can be Replated. Old Plates Bought, or Gold Separated. These Plates can also be purchased of JOHN TAYLOR & CO., Corner First and Mission Streets, San Francisco.

SAN FRANCISCO GOLD, SILVER AND NICKEL PLATING WORKS,

E. G. DENNISTON, Proprietor.

653 & 655 MISSION ST., SAN FRANCISCO, CAL.

Our Plates have been used for 20 years. They have proved the best. We adhere strictly to contract in weight of Silver and Copper. SEND FOR CIRCULAR.

RECEIVED EVERY MEDAL Awarded on the Pacific Coast for Silver-Plated Amalgam Plates and Best Gold, Silver and Nickel Plating.

Dewey & Co.'s Scientific Press Patent Agency

ESTABLISHED
1860

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S. F.

TUBBS CORDAGE CO.

(A Corporation.)

Constantly on hand a full assortment of Manila Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.
611 & 613 Front St., San Francisco, Cal.

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements so it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the member of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

Manufactured under Patents of April 27, 1880;
September 18, 1883; July 24, 1888;
and March 31, 1891.

Price of Plain Belt Frue Vanner, \$575, f. o. b.
Price of Improved Belt Frue Vanner, \$825, f. o. b.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frue" have improved (corrugated) belts does not militate against the superiority of the "Triumphs" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.
GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices.

DAVID McKAY, Jr.,
Supt. North Star and Original Empire Mining Co.
N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - \$650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for sale if we can be convinced.

Circulars and testimonial letters furnished on application.

WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

Was Awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891.

More than Double the Capacity
With One-Half Less Power and Occupying Less than One-Half the Space of any other Concentrator.

Built of Best Steel and Wrought Iron.
STRONG AND DURABLE.
Price - - - \$575 f. o. b.
Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. This excess in length of material effectually prevents the edges from cracking; plain edge belts have to stretch about one inch to the foot as they pass around the drums. This continuous stretch cracks the edges. The improved belt obviates that difficulty.

GEO. E. WOODBURY, Man'fr, 213 to 219 First St., San Francisco.

THE BLASDEL
CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Concentrating Belt manufactured in San Francisco; we can therefore fill all orders on short notice. The length and width of these belts are the same as is used on the Frue or Triumph Concentrating Machines, but can be made of any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight ruffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from backing on the sides and forming channels through the center. These slight ruffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

"RED FLAX CORD"
SQUARE FLAX PACKING.
MANUFACTURED FROM STRICTLY FIRST-CLASS FLAX AND PURE LUBRICANTS. HAS NO SUPERIOR for all Hydraulic Work.
CALICO WATER WORKS CO., CALICO, CAL., Dec. 16, 1890.
W. T. Y. SCHENCK—Dear Sir: We find your "Red-Cord" Square Flax Packing the "Best." Yours truly,
J. R. LANE, Secretary.
The red cord runs the entire length. Put up in boxes of 20 feet, or coils of 60 to 80 lbs. For sale by all dealers. W. T. Y. SCHENCK, Sole Manufacturer, 222 and 224 Market Street, San Francisco, Cal.

Adamantine Shoes and Dies
—AND—
CHROME CAST STEEL
Cams, Tappets, Bosses, Roll Shells and Crusher Plates.
THESE CASTINGS ARE EXTENSIVELY USED IN ALL THE MINING STATES and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to above conditions. When ordering send sketch with exact dimensions. Send for Illustrated Circular.
Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.
H. D. MORRIS, Agent, 220 Fremont St., San Francisco.

Old and New in Hydraulic Practice.

The wheel illustrated on this page is of the type commonly known as the overshot or gravity wheel, and is unquestionably the largest and most expensive water wheel ever constructed. It is located at Laxey, on the Isle of Man, a small island in the Irish sea, off the west coast of England.

This wheel is 72 feet in diameter, and is supposed to develop about 150 horse power, which is transmitted several hundred feet by means of wooden trussed rods having supports at regular intervals, to the bottom of which are attached small wheels running on iron ways, for purpose of lessening friction. The power thus transmitted operates a system of pumps in a lead mine, the duty of which is raising 250 gallons of water per minute at an elevation of 1200 feet. The water is brought some distance to the wheel in an underground conduit, and is carried up the masonry tower by pressure, flowing over the top into the buckets.

This great wheel was constructed some 40 years ago, and is said to have been running continuously during all this time, even making its monotonous rounds on the Sabbath, much to the annoyance of some of the old Scotch Dissenters who look upon it as a want of respect for the sacredness of the day. It is the great attraction of the place, hundreds of visitors making the trip to the island every year to see it.

The illustration affords a very good idea of the progress made since that time in hydraulic engineering, and is reproduced for the purpose of showing, by way of comparison, the advantages of the modern and now generally accepted method known as the Pelton system of power. The little cut in the upper corner represents a Pelton wheel of corresponding capacity (under similar conditions of head and water supply), being drawn to the same scale.

This Pelton wheel is a California invention, the result of the scientific development of the old "hurdy gurdy" wheel so commonly used in our mining regions in the early days. The Pelton wheel was used in California many years before its remarkable efficiency was recognized elsewhere, but now it is being applied all over the world. The mechanical construction is so simple and inexpensive, and the results so very satisfactory, that the use of the wheel is becoming indispensable, especially for mining, milling and electrical work.

The efficiency of the Laxey wheel, taking resistance into account, it is estimated, cannot be more than 65 per cent of the theoretical power, while the Pelton will develop fully 20 per cent more, and in size and appearance is a mere toy as compared to the ponderous piece of machinery shown, with its massive column, arches and stone foundations.

The most striking contrast, however, will be seen in the matter of cost, which is so

much less as to make a comparison almost absurd. While no data is at hand in regard to this, it is apparent that it would be at least as one to fifty in favor of the Pelton. Such an object lesson is of value in showing the wonderful progress made in engineering practice during the last half century, in bringing the forces of nature

city, who declined to give the \$1000 they at first voted, did so not because they were unwilling to give, but because the law prevented their appropriating money for such purposes. They passed suitable resolutions at their meeting favoring the miners' move.

The delegation to Washington had a long conference with the Governor of this State

A Foundry Purchase.

The Union Iron Works of this city have purchased the Pacific Iron Works, and will in future run the latter shops as a part of the Union Iron Works. The purchase includes the tools, patterns, drawings, engines, boilers, shafting, etc., and good will, but not stock manufactured or in process of manufacture, and not the accounts. The business of the Pacific will be for the present continued by the Union under the superintendency of Willis G. Dodd, so long and favorably known in connection with the foundry business of the Pacific Iron Works.

The ship-building department of the Union Iron Works at the Potrero has been brought to such proportions as to absorb a large portion of their work and space, and they have found it necessary to keep up with the mining machinery portion of the business, which is also large, to have such increased facilities as the purchase of the Pacific give. The latter shops are well equipped with good tools, and they have special facilities for manufacturing the Pacific water jacket furnaces, the improved White-Howell ore furnaces, the Dodd water wheel, etc.

This down-town branch shop of the Union Iron Works will doubtless give them also facilities for obtaining a certain class of small and repair work. It certainly will be much better for their mining-machinery department. With these two separate shops, the Union is better than ever prepared to take any class of work, large or small, that is required.

THE GOOD FEELING between the two formerly contending factions continues. At the last meeting of the Miners' Executive Committee, Senator John Boggs of Colusa addressed the committee, and said the people of the valley generally wanted hydraulic mining resumed, as it would give a home market for supplies and bring prosperity to the interior of the State. He said that he knew that the delegates appointed at the River Improvement Convention at Sacramento would work in harmony at Washington with the delegates of the Miners' Convention.

THE MAMMOTH CLAIM.—The Supreme Court of Idaho has decided the case of the Mammoth mining claim vs. the Lackawanna mine at Wardner, Idaho, in favor of the Mammoth claim, reversing the judgment rendered by Judge Sweet on the verdict of the jury in August, 1890. This suit involved land claimed by the Sullivan mine, and is adverse to the Bunker Hill and Sullivan and in favor of John M. Burke and his company, owners in the Mammoth claim.

SHASTA COUNTY will shortly have a permanent Miners' Association. A meeting will be held at Redding March 1st.

THE GREAT OVERSHOT WHEEL AT LAXEY, ISLE OF MAN, ENGLAND.

into subjection, and making them subservient to commercial and industrial purposes.

The Miners' Movement.

Everything connected with the newly formed California Miners' Association is going on well. The delegates to Washington are well on their way to join those who went from the River Improvement Convention. Several measures are under consideration in Congress looking toward appropriations for the rivers, and debris dams are also being considered.

Money is being collected to defray the necessary expenses and is coming in at a satisfactory rate. The Supervisors of this

the day before they left. He has aided them in every way, advising them as to the proper course to pursue, and giving them letters to influential men.

The House Committee on Rivers and Harbors seems to be favorably disposed, and it is only to be regretted that the miners' delegates were not in Washington a week ago to appear before them.

In several counties preparations are being made to organize permanent branches of the State Miners' Association, and in a few months doubtless there will be some thousands of members. The Executive Committee appointed is a very active one, holding frequent meetings and transacting a great deal of important business.

CORRESPONDENCE.

We admit, unadvised, opinions of correspondents.—ED.

Mining in Arizona.

Cause of Failures in Mohave County.

MINERAL PARK, MOHAVE CO., }
ARIZONA TER., Jan. 24, 1892.

TO THE EDITOR.—Perhaps some of your many readers would like to read a brief history of facts concerning mining in Mohave county, Arizona, for the past 20 years, and the mining industry as it now is. I happen to have been a resident of the county for almost that length of time, and ought to know whereof I speak, as I am one of the few that did not come to Arizona to learn my business—mining.

I will say that Mohave county, Arizona, has been cursed with more genuine frauds and hilks than ever before graced a mining camp with their presence. They come here as superintendents for mining companies, and it seems that the mining companies do not discover the mistake until their superintendent (?) has blown them in, all the way from \$5000 to \$50,000. Then they curse the country and everybody in it. Do they curse the superintendent? Oh, no! he is one of the family; he is a man of marked ability, when in fact, his ability perhaps lies in the direction of drinking, gambling, or spending the people's money on worthless propositions; the money of the people who have confided in him and thought he did know something of what he was trying to do, perhaps mining or running a mill. The first mining company which operated in this district was the Keystone Consolidated Nos. 1 and 2, which had for its superintendent, a man named Canfield. It built the Mineral Park Mill, situated in the wash west of of town, in 1875 and 76.

It run out its first bar of bullion on the 22d day of Feb. 1876, from ores which the superintendent bought from chloriders at these rates: \$50 per ton for crushing—80 per cent of the assay value—15 per cent discount on bullion, and from 2 to 8 per cent moisture, and gave his check for the amount due. He worked that ore up to only 60 per cent. Of course a millman can see he was losing money. The mill was turning out from one to two bars of bullion a day, worth from \$1000 to \$1500 per bar. Unfortunately for the county, just at that time we had no rail facilities. We got about one mail a month for about three months, so you see, the devil favored his own. Finally the checks came back endorsed and "not paid for the want of funds," the superintendent left and has not paid us a visit since. He reported to his company, no doubt, "there was nothing in the country." The merchants here, Breon & Spear who had a considerable hill against the company for supplies furnished, bought up all the claims the miners and chloriders had against the company; some for 50 cts. and some for 25 cts. on the dollar.

Finally they got a judgment; the sheriff stepped in, sold the whole business and the merchants hid it in. The firm concluded they would start it up; they knew as much about running a mill and crushing ores as a Wallipi Indian knows about a coffee mill. So they sent to Sao Francisco and hired the finest (?) millmen on the coast, in fact some of them represented themselves as Freiburgers, and they knew it all. After monkeying around and getting the mill in shape to run at an expense of \$2000, they started up and run a few weeks, with the same result—behind. The excuse was, the ore was too base; most of it chloride ores, mind you, and it was impossible to work it, consequently the mill laid idle again for about a year, and the miners were shipping most of their ore to San Francisco at a cost of \$100 per ton freight. During all this time, Messrs. Breon & Spear, having confidence that some day something or some man might possibly drop in who knew how to get the precious metals out of the ore, kept on buying some and stacking it up, and as they were furnishing some chloriders with the necessities of life, tools, etc., to work the prospects with, the ore accumulated on their hands at the mill. Old Ben. Spear made another trip to San Francisco to find a millman that might have some knowledge of metallurgy. He found one named Tyler, who was highly recommended as being "the boss." He was brought down and looked over the mill, which, by the way, was one of the best five-stamp mills on the coast. He had some alterations to make on the mill at a cost of about \$1000, got everything ready and started up. He crushed all the ores which had accumulated and more that came in during the time. Finally they made a cleanup, and old Ben found himself \$6000 behind. I never saw any man look bluer than old Ben. Spear did; his underlip

hung so low that he could have licked up the last bean in the bottom of the pot. We all felt blue. What in the name of heaven is the matter? Mr. Tyler takes his little gripsack and goes back to San Francisco, where he came from, and tells people that the ore here is so base it cannot be worked to a profit.

The mill of course lies idle for about another year; and all this time old Ben the merchant is supplying the boys with what they need, and what ore is not shipped out of the country is piled up at the mill.

About this time the Hackberry Mill and Mining Co. is organized and they are building a new 10 stamp mill on their property. They get all ready and start up and run for about 10 days. They cleaned up and made a successful run. The ore was worked up to 90 per cent of the assay value, and it was 60 per cent baser than any ores worked up to that time at the Mineral Park mill. How could that be? Simply because they had a man who understood his business. It was like the fellow in Arkansas playing the fiddle "he knew just what to do."

Old Ben got on his buckboard, went to Hackberry and interviewed the gentleman who was running the mill, who told him that he just simply wasn't chloridizing his ores. "You are not using salt enough." He came back and started up the mill again. He crushed all the ore he had about the mill; made a cleanup and found that they had worked the ore up to 90 per cent under the management of Mr. L. J. Lasalle. They then went to work and worked over all the tailings, about 1500 tons, and worked them up to 95 per cent. Of course Old Ben got all his money back and more too; he had cause to rejoice, and I will say we all did.

But just at that time an Eastern company steps in and buys the property; it put up \$25,000 as a working capital and in a short time dividends would be paid. But alas, in a few months it called for more "mud." Then the stockholders got disgusted, the property was not fairly represented, it was exaggerated, the company was not composed of mining men. They felt like they had been robbed and they wouldn't put up any more money, nor they wouldn't do anything. Finally they found themselves in a lawsuit; the lawsuit was finally settled by the party being nonsuited. The company discontinued and formed a new company, with Allen W. Thurman of Ohio as President; which is the present owner. The stockholders claim they put up \$25,000 as a working capital. They sent out a theoretical gentlemen to run the business, and in a short time the money is all gone and he makes a failure.

Will he kindly tell us where the money was expended? The mill lies idle for years again. Good responsible parties were anxious to lease it, but no, Mr. Thurman and his superintendent, Mr. Sperr do not want it leased; why, please tell us why. In a short time there is another assessment levied, they raise \$5000, and put two men to work in charge of the mill and mine to run it, who never saw a piece of ore in their lives, until they came to Mohave county, and did not know a piece of ore from a piece of granite. Of course they could learn, as this is a good school; consequently another failure resulted.

Mr. Thurman on his way to San Francisco on an electrocoring tour about four years ago, dropped in to see us. The writer of this article with some parties who were connected with him, wanted to lease the mill, oh, oo! Mr. Thurman was highly pleased with the way everything looked at the mill and mine and consequently when he got to San Francisco he was going to buy the machinery which the mill was in need of, to work his ores and all the mines' ores in the district. He did not care about leasing the mill at all, and in less than three months we would see a different camp here altogether. Mr. Thurman goes to San Francisco with his superintendent, Mr. Sperr, and there they are wine and dined by the good people of San Francisco, and after he gets to his home, in Cleveland, Ohio, a reporter of a Cleveland paper interviewed him as to his trip to the west, and Arizona in particular. In that interview the gentleman had the gratitude (?) to say that Arizona was the most God forsaken country he ever saw. He never bought a pound of machinery, and there the mill lies idle and decaying, until now it is not safe to run, and nobody wants it. It simply stands there as a monument of bad management. There is no good reason why the mill should ever remain idle one week. There are tons and tons of ore in sight—and Thurman's attention was called to it—which will pay to work here, but will not pay to ship. But no; he is like the dog in the manger.

Another heavy man drops in on us from Aspen, Colorado; his name is E. K. But-

tholf; he represents millions; he leases and bonds property, agrees to do everything or anything and finally winds up by doing nothing that he agreed to do. On some property he had under lease and bond, he agreed to do the assessment work for the year 1890; he got parties to do \$50 worth of work on the claims and then exacted a receipt for \$100. Now, that is the kind of capital that we are unfortunately cursed with.

Mohave county has been cursed with another lot of individuals which I will term middlemen. They come here and get in the good graces of the miners. They will lease and bond their claims for a small amount; some as low as \$500. They perhaps will go into California or Colorado and exaggerate to monied men, and they will want them to put up ten or fifteen thousand dollars on the same property. By the aid of an accomplice here, they sometimes win. It is only about two years ago that a man was in the East selling stock on a worthless piece of property that he or the company has not owned for 12 years. Gentlemen, let me tell you what is a fact. Arizona is getting tired of such treatment. You fellows have had your day. She is getting tired of seeing good people robbed of their good money. She is getting cursed for it.

It has got so in some localities in the East and West that if a person tries to introduce a piece of property in Arizona they will throw up their hands in holy horror, as if you wanted to take their life; even with people who never saw or never invested one dollar in the country. Now, gentlemen, why is it? There is no good reason for it. There is a world of property here lying idle at present that were it anywhere but here, it wouldn't be idle an hour. There is good property here that you can get by simply locating it—property that has produced thousands of dollars in an early day. But you must not expect to find it on top of the ground now. You will find the miners liberal to a fault. They will divide the last bean with you, if they think you are a man.

If you want to buy a piece of property, don't buy through middlemen. This camp has been self-supporting, and there is neither money nor enterprise here over and above what comes out of the ground by the aid of a windlass. There is no capital operating here, except the kind mentioned. The ledges are large, and some of them are well defined and good. The climate is excellent. If you hear anyone saying it's a "God forsaken country," simply tell them I say they lie. And if there is anyone in the camp who tells you there is nothing here and he is going to leave (but he stays, he can't be driven away), you can think what you please of him. I think he is a curse to any camp and the quicker the camp is rid of him the better. Yours, JAS. W. HAAS.

Concentrators at the Tyro Mine.

COULTERVILLE, Cal., Jan. 25, 1892.

TO THE EDITOR:—Your information gained from the Mariposa Gazette of January 16th, in regard to the Tyro (not Tyora) mine, and the three concentrators needed to handle the pulp in a satisfactory manner, was a little wide of the mark. The truth of the matter is that Mr. Sutherland, the superintendent of the Tyro mine, tried one "Tullock" concentrator, for which the manufacturers claimed a capacity of five stamps. After a trial of some three weeks, which was a failure, the man in charge (sent there by the owners) claimed that it would take at least three "Tullock" concentrators to handle the pulp from the five stamps, and was not sure that with three the results would be satisfactory.

The results being so poor, Mr. Sutherland at once bought two plain-belt Frue Vanners, and removing the "Tullock" had the Frues erected instead, and they are giving results which exceed even Mr. Sutherland's expectations.

The two plain-belt Frues are handling all the pulp from the mill, producing a grade of concentrations that are worth several hundred dollars per ton, and give the best possible results. Mr. Sutherland is highly pleased at the change and says that he will always stand by the Frues, and wants no more experimenting for him. Yours truly, H. S.

If any miner has any practical suggestions concerning proposed amendments to the mining laws, let him give them in writing to the Secretary of the Miners' Association and they will be duly considered by the Committee appointed by the Convention.

THE mining question will be pretty well ventilated during this Congress, if all the measures proposed are considered.

Geary's Mining Bill.

Congressman Geary has favored us with a copy of his mining bill introduced in Congress Jan. 5, 1892, as follows:

A BILL TO REGULATE MINING IN CALIFORNIA.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

That the Secretary of War shall assign three officers of the United States Army Engineer Corps, located in California, who shall have supervision of all operations conducted in said State of California under the operations of this act, and who shall be known as the United States Mining Commission of California.

SEC. 2. That all owners of mineral land situated in California, capable only of being mined by what is known in California as the hydraulic process, shall, before proceeding to operate such mine or mines, file with such Board of Engineers an application for a license to conduct such mine, and in such application shall designate the location of such mineral land, the number of acres and the mode of mining desired to be employed or used. On receiving such application, together with such sum of money as will defray the expenses of such commission in performing the services herein provided for, such commission shall examine such proposed mine and its surroundings, and shall determine whether such mine can be operated without doing any material damage to the navigable waters of the State of California or not. If the decision is that such mine can be operated, they shall issue a license allowing him to mine the land described in his application. If such commission shall decide that, by the erection of suitable dams or other appliances, such proposed mine can be operated without doing any material injury to the navigable waters of the State, such commission shall designate the character and kind of preventive work required before allowing such proposed mines to be operated, and the place or places where the same shall be erected or constructed, and the material to be used thereon, and the size of the same. Upon the completion of such preventive work, if constructed to the satisfaction of said commission, said commission shall issue its license permitting such mines to be operated. Any deposit made in the navigable waters of the State from mining operations not greater in degree than the deposit or wash usually deposited in rivers or streams from a like area of agricultural lands as usually plowed or worked, shall not be considered as producing any material damage to the navigable waters under the terms of this act.

SEC. 3. That the license herein provided for shall, when issued and while in force, be, in all proceedings in the courts of the United States, conclusive evidence that the work or works conducted or prosecuted in compliance therewith is not a nuisance.

SEC. 4. That the commission shall have the power at any time to revoke such license for violation of its terms, or when, in their opinion, any mine is producing any material damage to the navigable waters of the State. No change shall be made in the mode of working any licensed mine or increase made in the area worked without first obtaining the permission of said commission.

SEC. 5. That the sum of two hundred thousand dollars is hereby appropriated for the construction and erection of suitable dams at Bullard's bar and at such point on the north branch of the Feather river as shall be designated by said commission. Said commission shall make, or cause to be made, the necessary surveys, and shall prepare all plans and specifications for such dams; and the contract for erecting such dams shall be let by the Secretary of War in the manner provided for letting contracts.

SEC. 6. That all laws in conflict herewith are hereby repealed.

THE Nevada Transcript, which has been fighting for the hydraulic miners for 12 years, wants no more humbugging and says the hydraulic miners must act in good faith. It publishes the resolution requesting them to stop illegal mining, and says: "We would have continued this fight for an indefinite period had not the valley men joined hands with us to work for the common good and acted nobly and honorably toward us. A bargain has been made, and we are for the common cause and against any and every violator from this day henceforth."

THE richest county in the State—San Francisco—is so poor that it cannot afford to give a cent to further the mining interest, when other counties, in both mining and farming regions, have given both moral and financial support.

River Beds.

Some Suggestions for Removing the Sediment.

W. W. Waggoner writes to the Sacramento News as follows:

Among the most interesting of the phenomena of nature in California, either from a geological or an engineering standpoint, are the floods of the Sacramento river, and the effects due therefrom.

The Sacramento river and its tributaries have their sources in the lofty summits of the Sierras, where the annual precipitation reaches as high as 102 inches a year. This falling during the winter months, taxes the carrying capacity of the river to the utmost. During winters of heavy precipitation the banks are overflowed and great damage done.

The descending floods are nature's method of filling the valleys, leveling the earth's crust by depositing at levels the detritus of the mountains, composed of sands and vegetable mold so valuable to a fertile soil.

When nature has full sway, these descending waters, laden with their silted load, deposit the heavier matter as soon as the velocity is slackened, either in the bed of the stream or on the overflowed land, the lighter matter being carried along with the seething waters only to be dropped nearer the sea or carried in suspension to finally settle on the ocean's bed.

This continual overflow and deposition gradually raises the general level of the overflowed lands.

With the settlement of the valley, levees are constructed to confine the floods within their natural banks, usually with little avail. The waters, as if bent upon full sway, deposit the load in the bottom of the streams, forming bars, raising the bed higher to overcome the obstacles in the way.

The inhabitants, equally determined, raise their levees higher, higher; the result being that in the course of years the river rolls to the deep in a bed far above the level of the surrounding country, while the people rest uneasily at the impending danger of an overflow, with its disastrous results.

The Sacramento and its tributaries illustrate, while the river Po has been cited in the text books on geology as an example of this law.

With the settlement of the mountains, the hillsides that were covered with timber and low matted shrubbery (Nature's restraining works) are cleared away, the soil upturned, the work of erosion goes rapidly on with an increased pace. And with difficulty does the farmer prevent his soil from joining the debris of the landslides or the natural wash of the uncultivated portions.

Concerning the flow and filling of the Sacramento river, much has been written, but comparatively little has been done by way of improvement.

The problem is great on account of the annual precipitation coming in such a short period of time. In the outline of a scheme of improvement the problem may be divided into two factors.

First—Increasing the capacity of the existing streams, that the waters may be discharged into the sea as rapidly as possible, thereby preventing the flooding of the surrounding country.

Second—The prevention of the detritus from filling the watercourses, thereby diminishing their efficiency.

On the first division I will not enter, but desire to call attention to a few points that may lead to the solution of the second.

In considering the second division, it is well to note the sources of supply of the debris. Of the natural wash, much has been said concerning it in the controversy between the miners and farmers. By the latter it is stoutly denied that it is as great as is claimed for it. A little observation in the foothills, either of the Sierras or the Coast Range, will satisfy any one of the magnitude of the natural wash, and a perusal of the report of the engineers, either of the General Government or of the State, will surprise any one as to the quantity of debris annually sent down from the sections wholly agricultural.

The reason of this difference of opinion is, that it is washed off during the winter rains, and its effects cannot be clearly seen.

During the first decade of mining, surface mining was at its highest; the amount of fine stuff and sand was greater than was found in the ancient river channels and was carried rapidly to the level lands. Of the gravel still in the creeks, it is coarser and is moving more slowly toward the valley.

Since the cessation of hydraulic mining, the mountain streams during the winter floods have been clearing their channels, carrying the sands onward, steepening its grades that were lessened by the deposits, so that to-day most any of the mountain

streams will show that the gravels have been washed out 20 feet in depth.

In future years, unless some obstruction is placed in the way, there will be a greater quantity of coarse matter discharged annually than has been in times past.

The sands and gravels are accumulating at the mouths of the streams, where they debouch from the mountains ready to be carried into the rivers at each succeeding flood. The beds of the rivers that are now deeply filled will receive greater additions.

The danger from floods will also be increased, since the waters from the mountains will be moving with greater velocity on account of these steeper grades.

To improve the channels and arrest these moving sands, but little has been done, save a few small dams constructed by miners and farmers to turn the water into their ditches. For permanent relief, it was proposed by the farmers, backed by the mandates of the court, that the hydraulic mines be shut down. So far, little benefits have been derived from the plan, because the tailings will continue to drift down for years to come, and the natural wash will be increased with the clearing of the forests and settlement of the mountain lands.

Restraining dams have been proposed. Whenever properly built, they will be found effective, being in reality retaining walls for banks of sand and gravel. Their efficiency ceases when the grade of the channel back of them is sufficient for the floods to carry their load of debris over them without depositing any. These have been proposed for favorable places in the streams coming from the mining regions.

But to impound debris so that at no time will it be in danger of being washed over the restraining works, the dams should be built in places out of the channel of winter floods.

Besides these deposits, the great mass of sands at the mouth of the streams should also be restrained from entering and filling the main water courses.

To do this at the least expense and effectively, to my mind, will be to construct a large canal to carry the flood waters from where the mountain streams leave the foothills, out of its old bed, around the great mass of tailings and discharge it into the river below.

By constructing a dam at the stream's mouth with a wide and carefully designed waterway, together with properly located levees on each side, the waters, during the low stages and ordinary winter floods, will enter into a large lake, their impurities settled and discharged comparatively clear into their old channels, thereby not affecting navigation.

During times of great flood, the surplus water flowing through its new channel, freed from its sandy bed, carrying but little sand with it, will discharge into the river ready to do its full duty in moving the already existing bars toward the ocean.

The Yuba river, having by far the most extensive banks of tailings, offers especial inducements for its improvement on these lines.

About two miles below Dugger Point the Yuba has always shown a tendency to break through the levees and flow out upon the lowlands into Dry or Reeds creek and discharge into the Feather river about eight miles below Marysville. By building a dam at a suitable point near this place, constructing a canal into Reeds creek about three miles in length, enlarging the creek and leveeing the whole throughout, the condition stated above will be fulfilled.

The present bed of the river, with a dam across its mouth, will afford a settling reservoir of upward of 20 square miles; that will effectively settle the immense deposit of sands in the Yuba from its mouth to Dugger Point, care for all the debris that will be washed down, as well as afford a settling basin for the hydraulic mines for years to come.

The danger of the Yuba cutting a new channel north of Marysville, diverting its waters with those of the Feather into the old slough west of that town, with its inundation, will be averted.

In addition to this settling basin, a large belt of lowlands east of the Feather river will be improved and reclaimed by a deposit of silt. The other tributaries may possibly be treated in like manner.

With this source of feeling eliminated, it will be possible for the Sacramento river to scour its bed, deepen its channel and obviate the necessity of building the levees skyward, as is now the increasing custom. Then, with a judicious correction of alignment, a watercourse is possible to be established equal to that of 40 years ago.

DO NOT GROWL NOW.—Since the Miners' Convention, where the miners and farmers joined hands in favor of the resump-

tion of hydraulic mining under restrictions agreeable to both parties, the feeling here has radically changed toward the Valleyites. Heretofore, when a load of goods arrived here from Marysville, the sight of it to most of our people affected them as bad as waving a scarlet flag in front of a bull. Things have changed now. On Tuesday afternoon a 16-mule team with a schooner and two back-actions, pulled into town laden with goods for some of our merchants. These goods were sent by way of Marysville, just to show the people down there that we had buried the hatchet as well as the tomahawk. May peace forever reign between the miners and the valleyites.—Nevada Transcript.

No Money for Miners.

The San Francisco Supervisors voted \$1000 toward the expense of the Miners' Convention Committee to Washington, and at a later meeting, on the same day, took it back. The question was raised of the Board's legal position in such a case—that is, whether or not it had the power to make such appropriation. The question was submitted to Counselor Durst, and his reply was filed, from which the following extracts are taken:

"I find no general law giving the city power to contribute money as above referred to, nor is there any provision in the city's charter that gives in express terms such a right. Section 95 of the Consolidation Act provides that payments of demands for certain enumerated objects shall be made, and none others. It is evident that if the municipality has any authority at all, to contribute to the expenses above referred to, it must be either by Subdivision 15 of Section 95 of said Act, which provides that expenditures authorized by the Board of Supervisors, in the lawful exercise of their powers, for objects other than those specified in the other subdivisions of the Section, may be paid out of the Surplus Fund, specified in Sections 97 and 98, but not otherwise; or by Subdivision 1 of Section 1 of an Act entitled 'An Act to confer further power upon the Board of Supervisors,' etc., approved March 30, 1878: 'To pay out of the General Fund not to exceed \$3000 per month for objects of urgent necessity not otherwise provided for by statute.'

"The municipality is created by Act of the legislature. It is an institution of the State, established for certain public purposes, and for effecting those purposes it is invested with certain corporate powers and is charged with corresponding duties—all either expressly or impliedly provided for in the statutes. It can exercise no powers but those which are conferred upon it by the Act by which it was constituted, or such as are necessary to the exercise of its corporate powers and the performance of its corporate duties. The Board of Supervisors has no authority to appropriate any of the revenues of the city, except to enable it to discharge some duty imposed by law, or to accomplish some object for which the corporation was created."

Mr. Durst adds that an excuse for such an expenditure could not be based on any benefit the city might hope to derive, because it could not be direct; it would only be incidental, and the city could justify financial aid to a competing railroad or the Nicaragua canal on equally good grounds, nor is such an expenditure an urgent necessity within the meaning of the Act. Urgent necessity, here, means those things that are of vital importance, and within the scope of its authority and the object for which it was created.

Impounding Debris.

The House Committee on Mines and Mining has agreed to report favorably Representative Caminetti's joint resolution concerning the mining debris question. The resolution recites the provisions of the act of Congress of October 1st, 1888, under which a commission, composed of members of the engineer corps of the United States Army, was appointed to investigate the mining debris question in California, and submitted a report thereon; and the fact that notwithstanding that said report absolutely shows the existence of "vast deposits of mineral lying in the canyons and plains below the foothills, portions of which will be carried down during the floods and eventually lodge in the streams," no estimate was made by the chief of the engineer corps of the amount necessary to commence a system of improvement required to restrain the mining debris where it is now lodged. The resolution says: "It seems from said report to be necessary to do so without delay in order to prevent its final lodgment in navigable streams, causing incalculable

damage, and also in order to make effective the expenditure of money in improving the Sacramento and Feather rivers. The Secretary of War is requested to submit for the consideration of Congress, such a further estimate of the amounts required, and which can be spent profitably during the coming year in making the improvements recommended by the commission to restrain the mining debris and prevent its lodgment in the navigable rivers."

Caminetti's idea is to get the matter before the Secretary of War again and have a new report made by Major Heuer, if possible, recommending that \$500,000 or \$600,000 could be profitably expended during next year. Congress might then appropriate 60 per cent or 70 per cent of this amount. Bills and resolutions concerning the improvement of rivers and harbors usually, if not invariably, are referred to the Committee on Rivers and Harbors in the House, but in this instance Caminetti so worded his resolution that it would appear to be a proposition affecting mines more than rivers, and consequently it was referred to the Committee on Mines and Mining, of which Caminetti is a member.

Mining Department at the World's Fair.

Chief Skiff of the Department of Mines and Mining has returned from a trip in quest of rare exhibits for his building, says the Chicago Herald. He visited New York and Washington scientists and scientific institutions, and was promised a number of rare displays. "Every, high and low, official and layman, teacher, scholar and truant is enthusiastic for the glory of the great World's Fair," said Mr. Skiff. "I have been promised a rare collection, in metallurgy, of iron from Russia and a number of noted castings from the same section. Geo. H. Kunz, the well known diamond expert, will send a valuable collection of antique mining literature. English, the great New York collector, will also send an elaborate collection of minerals. The Columbia School of Mines will make an exhibit in scientific demonstration. Prof. Foote of Philadelphia, who has already asked for space for his marvelous collection, starts abroad at once to make several important additions to it."

Chief Skiff visited the Geological Survey in Washington and had satisfactory interviews with Maj. Powell and Prof. Clark. Both these officials will supplement the work of the Department in various directions. Patent Commissioner Simmons and Mr. Rice will furnish a number of models illustrating the steps of inventions by which the present advanced condition of mining machinery has been reached. "This feature of the mining exhibit," said Chief Skiff, "will prove a very valuable and instructive one, as showing the evolution of mining in this country. Everywhere I went, people were deeply interested in the success of the Fair, and had no doubt of its unprecedented success. In incidental talks with members of Congress, I found nothing but the best feeling toward the Exposition."

The Last Chance Wins.

At Boise, Idaho, the jury in the notable case of the Tyler Mining Co. of Portland versus the Last Chance Co. of San Francisco and Wardner returned a verdict for the defendants. Both companies laid claim to a large body of rich ore which crosses both properties. Each company claimed priority of location. The case will be taken to the Appellate Court at San Francisco. The suit is probably the most important mining case ever tried in Idaho. The property involved, is on the great vein from which the Bunker Hill, Sullivan and other famous Coeur d'Alene mines derive their wealth, and the territory in dispute has been shown to be immensely valuable, at least \$1,000,000 being at stake. The litigation, which is an action in ejectment, began in August, 1891, soon after the Tyler people broke into the Chance works. About the same time an injunction suit was started and the injunction was granted by Justice Field restraining the Chance mine from working in the disputed ground. This order was so modified by Judge Beatty that work could be continued under the supervision of an agent of the court, who has handled the proceeds of the ore taken from the ground in dispute and who retains the profits subject to the direction of the court. The value of the ore taken out by the Chance Company is not known, but runs into the hundreds of thousands, the slopes being as large as good-sized houses. The ground has been producing three or four years, and there are said to be still many bodies of ore showing.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

El Dorado.

VAN.—Georgetown *Gazette*, Feb. 5: Messrs. W. D. English and Barry Baldwin, of San Francisco, came up last week upon business relating to the Van mine, and returned on Tuesday. They and Tom Newland have decided upon sinking the shaft 100 feet deeper, and we hear that specifications for bids will be made in a few days. E. W. Chapman of the Taylor mine is looking into the Eureka mine of this place with a view of purchase. This move is received with much interest by our citizens, as every miner who knows this mine and its history feels confident that once under the management of practical and progressive mining men like the Chapmans it will prove a valuable property. Gitchell Gulch continues to yield him golden nuggets weighing into the ounces. Tom Armstrong has struck new diggings this side of Jones Hill, which shows flattering prospects.

Humboldt.

THE OIL WELL.—*Western Watchman*: We are pleased to state that the temporary cessation of work at the oil well has come to an end. It was caused by the fact that the men who had been engaged for the skilled work of tempering drills, to come up for duty at the time the works were perfected and in readiness for operations, failed to meet their appointment, therefore in order that no half-way work be done, the operations ceased until the proper mechanical skill could be engaged. Two men were sent out on Tuesday of last week, and two more were sent out on Monday of this week. These will fill the complement of men required to run day and night, according to the program of the directors. It is thought by those who understand the nature of the rock to be pierced, that they will make at least 50 feet a day, and that if they have one month of good work without stoppage, the auger will sink 1500 or 1800 feet. We shall look for a definite report of operations next week.

Los Angeles.

BREA.—*Riverside Bee*, Feb. 4: An oil company, while prospecting in the hills west of Los Angeles, discovered a mine of brown hrea which they think will be a bonanza for them. It burns freely in stoves and open grates and is considered to be equal if not superior to coal for heating purposes, and is being furnished in Los Angeles at \$4 a ton. If it proves to be all that is claimed for it, and the supply is ample—and it is said the hills are full of it, it will do much toward solving the question of cheap fuel.

Napa.

QUICKSILVER SHIPMENT.—*Independent Callistogian*, Feb. 9: It is a number of years since the shipment of quicksilver from Calistoga in one month equaled those of January. The total amount was 1,181 flasks, or 90,346 pounds. The product of each of the four mines was as follows, the figures expressing the number of flasks:

Napa Consolidated.....	525
Gt. Western.....	319
Bradford.....	232
Sulphur Bank.....	105

In addition to the metal shipped from the Gt. Western there remain at the mine, as a portion of the product for the month, 50 flasks of metal.

The large amount of metal credited to the Napa Con. is to a great extent due to accumulated ore taken from the drifts or stopes previous to the burning of the Chinese quarters. The number of men now working there is far below the average.

Nevada.

WASHINGTON DISTRICT.—*Nevada Transcript*, Feb. 8: Mining at this place promises to be active this coming spring and summer. Fritz Meister and company, owners of the Allen and other ledges near the mouth of Canyon creek, now have a mill on the ground all ready to be erected, just as soon as lumber can be gotten in for the necessary buildings, flumes, etc. Donohoe and Stewart, owners of the Maryland ledge, farther down the river, have the finest prospect, as far as developed, of any so far found in the district. The first crushing of 14 tons paid over \$18 per ton, and there is plenty more of such ore left in sight. At the German mine, Supt. Cooley now has his main tunnel in over 450 feet. It has been a very expensive tunnel so far, as it has been in very hard rock the whole distance. After extending the tunnel a few feet further, it is Mr. Cooley's intention to raise up through to the upper tunnel, a distance of 128 feet, to connect with a large and rich chute of ore at that point, when stopping will be commenced, a mill built and other needed improvements made on the property.

A THREE DOLLAR DIVIDEND.—*Grass Valley Telegraph*, Feb. 3.—The Morning Star Gravel Mining Company will this month declare the largest dividend yet made by that company. The dividend will be \$3 a share on the capital stock and is divided No. 16. The Morning Star is now looking better than it has ever looked and there is a hoist of gravel 14 feet high and 300 feet wide now in sight. The dividend will probably be declared this evening.

THE SEVEN-THIRTY MINE.—*Grass Valley Tidings*, Feb. 5.—Within the last few days the lessees of the Seven-Thirty mine at Deadman's Flat have placed in the keeping of the Citizens Bank of Grass Valley a quantity of ore too rich to be otherwise disposed of, pending reduction. The gold is coarse and wiry, and much of the ore is of a rich specimen grade. The quartz abounds in iron carrying gold. The ledge is ten inches in width at the point where the rich ore is being extracted. The lessees are confident that they are on the edge of a "hunch" such as that from which they extracted in the neighborhood of \$10,000 a year ago. McLachlan & Co's bond of the property expires March 1st, and the owners will not renew it. The bond price is \$7,000, of which almost \$1,000 has been paid.

In view of the developments already made, and the developments in the California mine, separated only by one claim and in which direction the rich shoot of ore runs, Seven-Thirty stock must be regarded as a good buy.

Placer.

WHERE THE TUNNEL IS TOO HIGH.—*Placer Herald*, Feb. 9.—In running a tunnel to tap the main channel in the Dardanelles gravel mine, near Forest Hill, it was found that it was too high. The tunnel at a distance of 2,600 feet struck the rim of the channel. Ordinarily the remedy in such cases is to go back and drive another tunnel on a lower level, which is very expensive and which only a very rich prospect will warrant. In this case, however, the difficulty has been overcome by a cheaper method and one which will interest mining men as something new in the plan of mining development. In the first place an endless three-quarter inch steel cable was put in the full length of the tunnel. It is run by a two-foot Hurdy wheel at the tunnel's mouth. This cable is made to carry the cars in and out and at the extreme end of the tunnel, 2,600 feet from the mouth, it runs over a 9-foot wheel, and this wheel in turn affords power for hoisting the cars up the side of the channel which has an incline of about one foot in three, and runs a pump that keeps the lower levels of the mine free from water. Should this plan prove successful, and so far as tried it works admirably, it will prove a boon to many miners who, find, after expending thousands of dollars, that their tunnel is too high.

YIELD FROM THE WASTE DUMP.—*Placer Herald*, Feb. 6: Thos. Manahan and Benj. Hawkins, of Ophir, obtained from the Eclipse mine owners the privilege of working over their waste dump, agreeing to pay for the same 20 per cent of all they might make. In about a week's work they culled out ten tons of ore which they had crushed at the old Lavalie mill, and which yielded them \$600, or at the rate of \$60 a ton. They are now at work sorting out another crushing. This yield is large, and when we consider it is taken from the waste dump, it is astonishing. On the Eclipse mine is a good mill and good hoisting works, and yet the company that erected them was closed out presumably because the mine did not pay. Their successors, after taking out about 200 tons of ore, which ore is not yet crushed, have also closed down. These hitches in the mine's operations have impressed the public with the idea that the mine is poor property, but if we may judge from the yield of the waste dump, the fault in the past has existed more in the management than in the mine.

Plumas.

BROOKS CLAIM.—*Plumas Bulletin*, Feb. 4: From A. D. Hallstead, who was in Quincy Sunday from Twelve-Mile Bar, we learn that five men are at work on the Brooks claim, under the management of Henry Patten. The property is owned by Wm. Duncan, of Oroville, and it has been in operation all winter. The claim is said to be good. The Hallstead Bros. are driving a tunnel to crosscut a chimney of ore developed above. They think they are now on the end of the chimney. This tunnel will tap the vein 120 feet deep. Cap. Corser, Fred Lewis and Francis Jackson will all begin mining as soon as the spring opens.

GREENVILLE.—*Cor. Plumas National*, Feb. 9: The Green Mountain mine, under the able management of G. P. Cornell, is being pushed to a successful opening in the near future. The No. 6 tunnel nearly cleaned out, and milling of ore and development work will soon be prosecuted. Mr. Whitney, Supt. of the Crescent mine, informs me that the pumps are already running, and the work of rebuilding the hoisting works, which were destroyed by fire Jan. 20th, will be pushed as fast as men and material will permit.

Sierra.

SIERRA CITY.—*Mt. Messenger*, Feb. 6: T. Berger was down from Sierra City Tuesday, and said that he has seven men pushing his lower tunnel (10 near a thousand feet) ahead rather slowly through hard bedrock. There is good paying quartz in the upper tunnel.

GIBSONVILLE.—Latest advices from Gibsonville are that there is an abundance of rich gravel at Thistle Shaft. Fifty men are working there and the force will be largely increased soon, as water is more abundant. The proposed 500 feet of tunnel, from Wallis Creek to Thistle Shaft, is considered one of the sure events in the future of this old-time mining camp.

Siskiyou.

MTLL.—*Yreka Journal*, Feb. 4: Clarence Davis and Arthur Scheld have just completed a fine little four-stamp quartz mill for prospecting their quartz ledges on Long Gulch and Greenhorn, and are now getting the engine in readiness at the Y. R. R. Co's round house. The engine is the one formerly used by Nick York in running his steam circular saw in cutting cordwood, and the boiler was given them by Chas. Kapler, of the Etna brewery. The cams or arms for raising the stamps were made by J. W. Scheld, the well-known blacksmith of the Scheld family, who is quite a genius also in the machinist line. Davis & Scheld intend setting up the mill on Long Gulch, where they have some fine looking quartz ledges, and are also interested in ledges on same gulch, discovered by W. W. Davis and Jas. Manning. If these ledges should prove extensive and valuable, a large mill will be built, to work them on a more extensive scale.

COAL.—Work in the Siskiyou Coal Mine at Willow creek, about nine miles north of Yreka, has been suspended until the company obtains a heavier steam engine, as the one now in use is too light to handle the increased amount of water and haul up the coal at the same time. The coal realized since getting down to the main bed is of excellent quality, and when the mine is worked with machinery of sufficient power a great quantity of coal can be taken out to supply the entire market in this county, besides shipping to other sections.

HYDRAULIC AND PLACER.—The hydraulic and placer miners have not been able to do much mining the past week, owing to cold weather preventing the snow from melting to furnish water, but as soon as we have warm weather and rain we may look for lively times in all the camps until a later period than for several years past. The mountains now contain a vast quantity of snow, which has become hardened so as to melt slowly for greater benefit, as the soft snow sluiced off soon after falling seldom affords any great benefit, owing to the large surplus of water going to waste. Work will probably be commenced about the first of next month in the McConnell claim at Klamath river, which has been leased by a Chinese company. They intend working at

the old place, where they took out considerable gold two years ago, the place worked last year not paying well.

Tuolumne.

RAWHIDE GROUP.—*Tuolumne Independent*, Feb. 6: The Rawhide group of mines are situated to the north of Table mountain, Tuolumne county, on the mother lode of California. This section is a most promising one, and may be safely considered to be one of the best and most highly auriferous portions on the mother lode in Tuolumne county. It is less broken, and more generally defined, and has other advantages, viz: Water power and the electrical utilization of water power. The necessary electrical power can be obtained down in Mormon creek by the proper works being established in that locality. Water can be brought there to generate sufficient electrical power to run the machinery for all the mines in this group, either by one company or by the various interests joining together for the common good, thus dividing up the expense of the plant and transmitting the motive power by wires for hoisting and mills, as well as lighting the same.

Yuba.

MAY HYDRAULIC A LITTLE BIT.—*Grass Valley Union*, Feb. 7: The drift mining machinery on the Blue Point gravel mine at Smartsville has been partially covered up by a slide, and the Yuba county Supervisors have consented that the injunction against working the ground by hydraulic process shall be so far modified as to enable the owner, Patrick Campbell, to work away the gravel to rescue the machinery, provided that the time shall not extend beyond 30 days. This has been the first concession that has ever been made to Campbell, although he has been a heavy loser by the injunctions against hydraulic mining.

NEVADA.

Washoe District.

ALTA.—*Virginia Enterprise*, Feb. 7: We have the double rods in place up to a point in the shaft 680 feet from the surface. As the rods must be fitted in the open air, the stormy weather is against us to some extent.

OPHRA.—There has been raised to the surface during the week 27 tons of ore, the average assay value of which is \$22.10 per ton. Have continued the work of repairing and retimbering the main south drift on this level.

MEXICAN.—On the 1465 level the crosscut started west from the bottom of the winze sunk 101 feet down from the end of the crosscut run west from the main north lateral drift near the south boundary line of the mine, has been advanced 25 feet; total length, 43 feet; face in porphyry showing fine lines of quartz.

UNION CON.—On the 900 level the joint Sierra Nevada and Union Con. south lateral drift from the main west drift, at a point 1570 feet in, has been extended during the week 33 feet; total length, southward, 135 feet; face in porphyry and clay. Have resumed work in the joint west drift on this level.

CON. CALIFORNIA & VIRGINIA.—1100 level.—The upraise which was started at the mouth of the west crosscut No. 3, started from the main south drift, 310 feet south from the shaft station, has been carried up 25 feet; total height, 35 feet in a porphyry formation. A north lateral drift started at the shaft station has been advanced 40 feet in porphyry showing streaks of quartz. 1650 level.—Have continued to extract ore of fair quality from the drift run west from the top of the upraise carried up 50 feet above the southwest drift. Ore of fair quality has been extracted from the drift run east from winze No. 3, 72 feet down, in working upward from that point. From the north end of the California ground on the west side are working in the old stopes and extracting therefrom some ore of fair quality. 1750 level.—In working out and upward from the bottom of winze No. 2, sunk from the 1650 level, we continue to extract ore of fair quality. Have also extracted some milling ore at the point where the upraise carried up from the crosscut run west from the southwest drift made connection with the stopes on the eighth floor. Have continued to extract ore of average quality at the point where the upraise from the southwest drift, 70 feet north from the south line of the California ground, connected with the eighth-floor stopes. 1800.—Along the south end of the drift running south from the crosscut run east from the winze (No. 1) sunk from the 1750 level, we have continued to stoep out ore from the sill floor upward to the height of 28 feet, in ore of mining value. There has been extracted from all parts of the mine during the week 1037 500-2000 tons of ore, which was shipped to the Morgan mill. The average assay value of all the ore worked at that mill during the week (980 tons) was \$32.95. Bullion shipped to Carson mint, assay value, \$26,637.74.

GOULD & CURRY.—350 level.—West crosscut No. 1, from top of upraise No. 2 from 400 level, has been extended 19 feet through soft porphyry and stringers of quartz; total, 50 feet. East crosscut No. 1, opposite west crosscut, was advanced 14 feet; total length, 35 feet; face in porphyry and quartz. On the Suro tunnel level the joint north drift with the Savage is advanced 147 feet; face in porphyry. BEST & BELCHER.—900 level.—West crosscut No. 1, 100 feet north of upraise from 1000 level, has been advanced 24 feet through soft porphyry and stringers of quartz; total length, 54 feet.

Tuscarora District.

NORTH COMMONWEALTH.—*Times-Review*, Feb. 5: Second level.—Stopes going east from winze have improved, showing more high grade ore. Extracted 28 cars of ore, assay, car sample, \$43 per ton. West drift from No. 1 crosscut extended 19 feet in vein formation. No. 1 raise from west crosscut extended up 26 feet, encountered incline vein, 18 inches, giving low assays.

NEVADA QUEEN.—Fourth level.—South intermediate drift extended 10 feet in porphyry. The raise has been timbered up to second level and track put down to run to No. 2 chute, 180 feet. West crosscut raise in the vein extended nine feet, looking more favorable.

DEL MONTE.—Second level.—Stopes are looking well and will be connected with raise by the 6th, exposing good ore all the way. Extracted 12 cars first-class ore, assays \$275 per ton, and 26 cars second-class, assays \$45 per ton. East drift from No. 4 joint raise advanced 21 feet.

NAVAYO.—South intermediate below the 350 foot level extended three feet, the vein is small but rich,

East intermediate drift extended 11 feet and connected with the main workings.

BELLE ISLE.—No. 1 winze below the 350 foot level No. 3 vein, extended 41 feet, the vein is showing eight inches of first-class ore. The crosscut from No. 1 vein has been extended 12 feet, rock getting harder. The winze from the 250 foot level extended 12 feet, showing some good ore.

NORTH BELLE ISLE.—No. 3 north drift, 400 foot level, extended 13 feet. North intermediate above the 400 foot level, No. 2 vein, extended nine feet, showing some good ore. South intermediate above the 400, No. 1 vein, extended eight feet, showing 10 inches of good ore. South 500 foot level extended 14 feet, rock getting harder. The first-class ore is left stored under ground, pending the starting of the sampling works, to save extra-hauling. Hoisted 22 cars of second-class ore, estimated assay value \$30 per ton.

Pioche District.

FURNACE NOTES.—*Pioche Record*, Feb. 6: Furnace No. 2 has been thoroughly repaired and resumed operations. The present receipt of ore from the company's mines speaks well for the future yield. One furnace is kept going steadily and the bullion produced has an upward tendency in value. The reading room is well patronized by the men and affords them many hours of rational enjoyment. All the dwelling houses connected with the works are being painted, adding much to the appearance of the works. The governor connected with the main engine is undergoing repairs. It does not interfere with steady running of the machinery. The ore bins are rapidly assuming their usual quota of ore, and the late spell of good weather has caused ore to come in more rapidly. The round house is now completed and ready for occupancy by the iron horses. It presents quite a feature amidst the rest of the works. The scales from the old works have been removed to the new works, as those at present in use were found too light for weighing the heavy flat cars. The night train has been suspended for the present and the bands laid off, as it was found one shift was capable of bringing in the ore as fast as excavated.

ARIZONA.

Mohave Co. Miner, Feb. 6.—Charles Sherman and Ed. Thompson returned from their trip to the Chimabue mountains and report everything in that camp looking well. Several tons of high grade silver ore was shipped from the C. O. D. mine to the sampler this week. The ore was taken from a winze on the 150 level. Clack Bros. have considerable ore in sight in the part of the C. O. D. mine held by them under lease. All dead work has been done and hereafter they will devote their attention to taking out ore. Thomas McMahon and Thomas Burke have a carload of high-grade ore on the dump of the Prince George mine. Their showing in the stopes is looking fine and they will probably get several carloads more from the lynch. E. Eherman, one of the heavy stockholders of the Flores Mining Company, has been looking over Weaver and Minnesota districts, and was so much pleased with the latter district that he invested in some of its mining claims. A carload of ore arrived from the Berkley mine a few days ago and was run through the sampler, giving a good result in silver. A number of men are at work in the stopes and regular shipments of ore will soon follow weekly.

CEDAR VALLEY.—W. R. Judson, Supt. of the Arnold mine, went down to Cedar Valley this week. It is understood that the hoisting machinery will arrive in Hackberry in a few days and that it will be taken to the mine as soon as possible. A number of men have been employed for some time past in repairing the road from the Sandy to the mine over which the machinery will have to be hauled. Geo. M. Bowers and O. D. M. Gaddis have purchased a one-half interest in the mining claims held by White and Rucker in Minnesota mining district. E. Eherman has secured one-half of Messrs. Bowers and Gaddis' interest in the above-named district and will commence developing the best looking prospects immediately. One of the claims is a very promising property, showing free gold all through the ledge. William Rumpf came in from the new gold strike in the Chimabue mountain Tuesday evening. He says that the gold discovery of Brawn & Co. is panning out well. A shaft has been started on a three-foot ledge showing up well in coarse free gold. At the mine of Hutt and Hite work is progressing nicely and large quantities of ore are being put on the dump.

DAKOTA.

CONCENTRATES.—*Deadwood Pioneer*, Feb. 4: Work on the Uncle Sam and Bellevue tin mines at Nigger Head is being prosecuted and fine samples of the ores were on exhibition yesterday. Mr. John Treher and Tius Molitor are the principal owners and have a property second to none in the Hills. A few pounds of the ore was pounded up in a mortar and a fine bar of tin run out. It is estimated that the ore body now in sight will run about six per cent of metallic tin. A fine sample of ore from the Bullion mine of Galena is on exhibition at the office of John Biggaley. We understand that Sam Ranbauser of Central City has taken the contract to transport the machinery for the stamp mill to be erected at Mineral Hill, in Bear Gulch and that the mill is expected to be in operation by the first of May. The parties interested in this enterprise are men of means and experience and are well satisfied of the success of their undertaking, which necessitates the outlay of many thousand dollars.

NEW MEXICO.

ORE SHIPPED.—*Western Liberal*, Feb. 7: Holmig Brothers and Freidewald shipped a car of ore to El Paso this week from their mines at Granite Gap, which they located the first of January. A hand sample of eight tons assayed 47 per cent lead and 36 ounces of silver.

NEW DISCOVERY.—The *Liberal* was out this week to the new discovery of ore which is being worked by L. B. Durnill and John Miller. Miller was staked by Durnill some months ago and went to prospecting in the neighborhood of Lee's peak. He found a place there where work had been done in previous years and then abandoned. He prospected the place thoroughly and was rewarded by finding considerable horn silver, and so went to

work sinking on the ledge. He was rewarded by finding some very rich ore. He is now down some 40 feet and has a ledge about three feet wide with a pay streak of ten inches. The pay streak runs 200 ounces in silver, there have been numerous assays of it, some of which have run way up beyond this and none have gone any lower. Numerous assays of the rest of the ledge shows that it runs about 50 ounces of silver, but this is too low to pay to ship. Parallel with this ledge and about 40 feet from it, on the same location is another one. The extension of this ledge west is located by Presly Johnson, and it is the location known as the Maxfield claim, which was located, worked and abandoned by Lew Maxfield five years ago.

IDAHO.

TRADE DOLLAR.—Idaho *Avalanche*, Feb. 3.—Work has continued to be vigorously pushed at several points upon the Trade Dollar property. Tunnels number one and three are both being driven ahead and stoping is being done in number two. The Blaine tunnel is being widened for a double track at the rate of about fourteen feet per day, and the breast will be reached in another fortnight, when two air drills will be employed to continue it. Another air drill will be employed in crosscutting the country west from this tunnel to prospect the ground for other ledges showing up on the surface. The ore showing in the slope in number two tunnel is high grade with several inches of rich shipping ore.

LOWER CALIFORNIA.

ALAMO.—*Lower Californian*, Feb. 2: The Aurora company is expecting its new electric drill and equipment, and is building a house for its reception. Some talk is made of sinking a new shaft some meters up the hill from the present shaft so as to get a perpendicular shaft to a great depth, the present one making an angle at quite a depth down. The mill runs steadily daily as many hours as water will permit.

The Princess has found an entirely new ledge in the crosscut at the 200-foot level. This makes three ledges known to exist in Princessa grounds. Several locations have been made in the vicinity of these mines, as it is now definitely understood that more capital is soon to come in to explore the camp. The Princessa company has located the Princessa No. 2, lying north of the present mine, so as to hold its mill site and dumps, etc.

MONTANA.

PANORA.—*Butte Miner*, Feb. 4.—During the week an 18-inch streak of 140-ounce ore was struck in the face of the bottom level of the Pandora mine, near Soap gulch. The shaft is now 200 feet deep, and indications at this depth point to a bright future for this property. From ore already extracted two dividends have been paid, but during the coming two months the proceeds realized from the sale of ore will be used in defraying the expenses of erecting a five-stamp mill at the mine. A car-load of 73-ounce ore was shipped to the Silver Bow sampling works in this city a few days ago, and another shipment is now being prepared.

DEVELOPING A BONANZA.—Among the properties in the vicinity of Meaderville that will soon become well known by reason of its productiveness is the Mountain Chief, owned by Dave Upton and others. The property is one of the oldest in the camp, having been worked to good advantage in the days when the product had to be hauled in wagons 400 miles to railroad and thence shipped East for treatment, and situated in the heart of the copper-silver belt. About five years ago it worked under lease and yielded for the lessees considerable money. It is now being worked by Messrs. Eugene Sullivan, W. Murphy and Charles Nuss, who are sinking the shaft from a former depth of 400 feet to the 500-foot mark. The mine is equipped with first-class hoisting and pumping machinery.

AT THE MOOSE.—Work at the Moose, owned by the Boston and Montana Company and located East of Walkerville, is confined to one shift of about thirty men. Operations are being carried on at the three-hundred-foot level, from which considerable ore is being extracted. Lately some very rich specimens of ore have been taken from the vein, some of which were literally filled with native and wire silver.

STRIKING IT IN A WELL.—As an illustration of the manner in which ore bodies are frequently discovered in Butte, it may be stated that a strike of a foot and a half vein was made in a well near the Northern Pacific depot Saturday afternoon. The well is being sunk by E. H. Sherman just in the rear of his warehouse. The vein was struck at a depth of 20 feet, and assays from the ore made shortly after discovery gave it a value of \$57 in silver and \$20 in gold. After the strike was made known several parties endeavored to procure a lease on the ground, but were unsuccessful.

AT THE MOODOC.—The Modoc, one of the Anaconda Company's copper properties, located west of Meaderville, is again in operation with a full complement of men. The property is yielding about 400 tons per day, the larger portion of which is being taken from the west working of the four-hundred-foot level. The Modoc is considered one of the banner mines of the company and will, with greater depth, prove as a great producer as some of the large ones. The working force consists of about 60 men.

AN ADDITIONAL FURNACE.—With a view to increasing the output of the plant the Butte and Boston Company is adding to its smelter another blast furnace of 100 tons capacity. The work is almost complete, and within two weeks more the furnace will be in operation. The entire plant of the company is in full blast with a corps of 450 men, which, with the crew at the mines, swells the total to nearly 400.

OREGON.

OUR GOLDEN HILLSIDES.—Grant's Pass *Courier*, Feb. 4: John Hall and Isaac Van Dorn struck a fine ledge of point on Picket creek, about eight miles from this city, in their prospecting tour last week. In the same neighborhood a rich ledge of quartz was also found, and Mr. Hall exhibited some pretty specimens of free gold taken from the base of the point ledge. He has been in Josephine county for 16 years and like all our old settlers he is strong

to the opinion that there is lots of gold yet undiscovered in our hills. Heretofore the prospecting has been done along creek bottoms, but of late the hillsides have been found rich in placers. The gold has lodged in pockets on the hills, having washed down during long ages from the golden ledges above. Josephine county will soon be known as the richest diggings for both quartz and placers on the coast.

UTAH.

STRIKES.—*Park Record*, Feb. 6: It is rumored on the streets this week that the Lucky Bill shaft was close to a large body of good ore, so close, in fact, that while cutting a station on the 300 level the ore was uncovered. The ledge was at once crosscut, and shows up big and strong with a large streak of pay ore. Superintendent Burton at once brought some of it down and took it to Salt Lake, where an informal meeting of the directors was held. At this meeting it was decided that the shaft should be continued until it intersects the vein in its regular dip, which will be within the next 50 feet, according to the estimate of Supt. Burton. The ore is a combination of chloride and carbonates, and will undoubtedly run high in silver. The Lucky Bill is now making preparations to put in a hoisting engine early in the spring, as the shaft is getting to be of such depth that hoisting with a whim is slow and tedious work.

THE SILVER KING A MINE.—With a tenacity seldom equaled by men of limited means, David Keith and associates, who have a lease and bond on the Silver King mine, have worked away at the shaft started in that property by John Farish and others until it has reached a depth of some 800 feet, intersected the vein and become a mine in the fullest sense of the word. New machinery has been purchased from time to time as the shaft obtained depth, until now the property is well equipped and capable of hoisting a large quantity of ore. The ore-house being constructed by the Silver King people is fast approaching completion, and will be one of the best in the camp. The vein has opened good and strong, and ore extraction has commenced in earnest.

CAMP CROSSCUTS.—The improvements inaugurated at the Anchor concentrator were all completed this week, and the mill started up last night. Everything works smoothly so far, and no trouble is anticipated. Connection was made last week between the long drift from the 200-level of the Woodside shaft and the old workings, and the mine now has much better air. Charles Barnicott has put a force of men at work and will sink a shaft on the indications for coal he has recently uncovered on his claims below town. The possibilities of coal that near to Park City has a tendency to interest everybody in the camp, and should the croppings found lead to coal, it will be better than a silver mine to Mr. Barnicott. The men he has working are old Pennsylvania coal miners and they are working for an interest in the ground.

Obituary.

John J. Williams, a prominent member of the firm of Bisbee, Williams & Co. of this city, died at San Diego on the 16th ult. in the 47th year of his age.

Mr. Williams was born at Swansea, Wales, where he received his early training in the Vivian Smelting Works, and had the advantage of instruction from his father, John Williams, who in his day was one of the best authorities in this country in matters pertaining to the mining and reduction of metals.

In the death of Mr. Williams, the mining interests of this coast suffer a great loss and his family loses a kind and loving husband, father and brother.

For many years Mr. Williams was identified prominently in the development of the copper mines of Arizona, and under his direction the Old Globe copper mines of Arizona were developed and placed upon a paying basis. Lately, he has been in the employment of Messrs. Phelps, Dodge & Co. of New York looking after their interests in Arizona.

He was a brother of Lewis and Ben Williams, who have so successfully conducted the mines and smelting works of the Copper Queen Con. Copper Mining Co. at Bisbee, Arizona, since 1881.

His many friends deplore his death, and desire to express to his bereaved wife and family their heartfelt sympathy in this the saddest hours of their lives.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

TOMASSO HILL M. CO., Jan. 2. Location, Mexico. Capital stock, \$1,000,000. Directors—A. H. Butler, E. A. Brannan, C. H. Haley, H. N. Gray and J. B. Lewis.

WILLIAMS HARDWARE CO., Jan. 3. Capital stock, \$50,000. Directors—S. G. Williams Sr., E. W. Williams, S. G. Williams Jr., H. S. Warner and S. C. Walls.

Eastern Metal Markets.

New York, Feb. 10.—The following are the closing prices the past week:

	Silver in London	Silver in New York	Copper	Lead	Tin
Thursday.....	412	9 1/4	10 7/8	4 2/8	19 60
Friday.....	412	9 1/4	10 7/8	4 1/8	19 60
Saturday.....	412	9 1/4	10 7/8	4 1/8	19 60
Sunday.....	412	9 1/4	10 7/8	4 1/8	19 60
Tuesday.....	412	9 1/4	10 7/8	4 1/8	19 60
Wednesday.....	412	9 1/4	10 7/8	4 1/8	19 60

The metal market continues essentially unchanged, but the opinion still prevails that a revival in business is near at hand. Borax, quicksilver, tin and copper do not show any material change.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING FEB. 2, 1892.

- 468,144.—THIMBLE, ETC., FOR BARRELS—Anthony & Savage, Oakland, Cal.
468,291.—PILE ARMOR OR CASINO—Bedbury & Badgley, S. F.
467,968.—ANTI-FRICTION AXLE BOX—E. M. Bridwell, McMinville, Or.
468,069.—GRAIN CLEANER ATTACHMENT—Henry Bryan, Modesto, Cal.
468,218.—DOOR SECURER—C. F. Caldwell, Bridal Veil, Or.
467,917.—TELEPHONE HOLDER—J. A. Christy, S. F.
468,134.—GRAVEL SCREEN—F. T. Gilbert, Walla Walla, Wash.
468,197.—GRAVEL SCREEN—F. T. Gilbert, Walla Walla, Wash.
468,063.—AMALGAMATING SILVER ORES—Alexis Janin, S. F.
468,303.—BAND SAWMILL—C. J. Koefoed, S. F.
468,036.—HOLDER FOR BRUSHES, ETC.—W. F. Loan, Portland, Or.
468,064.—CABLE GRIP ADJUSTER—H. H. Lynch, S. F.
468,029.—VALVE—D. R. McKim, Gold Hill, Nev.
468,205.—SLING CINCIN—D. O'Sullivan, Spokane Falls, Wash.
468,206.—RIFLE SIGHT—R. W. Parker, Camp Huachuca, A. T.
468,208.—AERIAL TRAMWAY—Prunetti & Avignone, Sierra City, Cal.
468,066.—SEPARATOR—F. H. Wheelan, Santa Barbara, Cal.
468,067.—BALL-BEARING—H. G. Yates, S. F.

The following brief list by telegraph, for Feb. 9, will appear more complete on receipt of mail advices:

Frank A. Fox, San Francisco, car coupling; Frank A. Huntington, San Francisco, crushing mill; Edward M. Knight, San Francisco, filter; Thomas Powell, Stockton, wheel pump; Johnathan M. Robinson, Vacaville, propelling vessels; Anderson & Fairchild, S. F., adjusting device for cable grips.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BALL-BEARING.—Henry G. Yates, S. F., assignor to the Universal Ball-Bearing Wheel Co., S. F. No. 468,067. Dated Feb. 2, 1892. In ball-bearings, as usually constructed, one or more rows of balls are fitted to travel in a groove or grooves formed upon the axle or a collar which is fixed to the axle and enclosed in an exterior casing similarly grooved, so that the outer peripheries of the balls run in contact with the interior wall of the casing. The weight of the moving part is thus carried upon the balls which are at that time passing between the surfaces, which are forced toward each other by the weight, and as soon as they have passed this point others take their place, and the remainder of the balls traveling around in a circle are comparatively free from the weight, so that, although turning in opposite directions, there is comparatively little friction between their rubbing surfaces. In this invention of Mr. Yates', he has shown a hub carrying a wheel or pulley and turning about a shaft which is of smaller diameter than the bore of the hub. Semicylindrical grooves are made in the ends of the hub and the balls are retained between the grooves in the hub ends and corresponding grooves in collars which fit the axle and abut against the hub ends, so that when properly adjusted the hub is carried upon the balls out of contact with the axle, and is practically supported upon all points within the collars instead of at a single point, as in the ordinary construction.

SEPARATOR.—Fairfax H. Wheelan, Santa Barbara. No. 468,067. Dated Feb. 2, 1892. This invention relates to the separation of foreign articles from grains, seeds, etc. The general object of the invention is to separate the smoother from the rougher particles of any material which is composed of particles of different degrees of smoothness, and its special object is to separate the dirt and other foreign particles from grains, and particularly from leguminous seeds. The invention consists in feeding material composed of particles of different degrees of smoothness, upon a rotating surface, on which said particles are subjected to centrifugal action, which produces a separation of those particles having a less coefficient of friction with the surface, from those particles having a greater coefficient of friction therewith. The invention also consists, in connection with the above, of guiding the material to such a point on the surface where the centrifugal force can act to effect the separation of the smoother from the rougher particles, then relieving the particles to permit their separation, and then catching the separated particles at different points on the surface and maintaining their separation.

CABLE GRIP ADJUSTING DEVICE.—Henry H. Lynch, S. F. No. 468,064. Dated Feb. 2, 1892. This device for adjusting cable grips consists of a take-up mechanism applied to the grip-lever and its connection with the stationary frame, whereby the wear of the gripping dies may be compensated, and the arc over which the lever is moved to open and close the grip, remains substantially the same at all times. By the

construction covered by the patent, it is rendered easy for the gripman to adjust the parts to the constant wear of the gripping dies and without stopping or taking his attention off his business.

GRAIN CLEANER ATTACHMENT.—Henry Bryan, Modesto, Stanislaus Co. No. 468,069. Dated Feb. 2, 1892. This attachment for grain cleaners is especially adapted for use upon traveling harvesters, and is useful in properly distributing grain and chaff from the sides toward the center of the cleaning shoe when the machine is working upon sidehills.

FLASH-LIGHT BURNER.—Sylvester M. Williams, S. F. No. 467,936. Dated Jan. 26, 1892. This invention relates to that class of burners for igniting magnesium and other flash-light powders for use in producing artificial light for photographic purposes. The object of this invention is to provide a flash-light burner simple in construction and operation, of great capacity, and which can be used in daylight as well as in darkness.

Mining Share Market.

SAN FRANCISCO, Feb. 11, 1892. Mining shares the past week were quite active, but "spotted." Hale and Norcross is the last stock to develop life and make one of those quick up-moves which have been a characteristic feature of the market. It now looks as if the "brokers' combo" is forcing inside stock pools and mill rings into the market so as to buy stock to keep control of the mines marked for hoisting.

The quiet but vigorous working work that has been under way in the Hale and Norcross mine for three years past has made it possible to extract the rich ore to the west at a nominal cost, which doubtless is contemplated to be done by the rings if they retain control in such a way that outside shareholders or reports to the public will be kept from getting the bullion. It looks now as if the little game had been thwarted by the developments in the suit against the Hale and Norcross directors, throwing into the speculative arena a brokers' combination calculated to make the rings buy stock to keep control of the mines, and not retain it as heretofore by the pernicious proxy system.

It is reported in well-informed circles that the present management of Hale and Norcross, realizing they cannot control enough stock to carry the election next month, has made advantageous terms with J. L. Flood to get control and put in office persons of his choice. Be this as it may, it is a well-credited fact that Mr. Flood's brokers are picking up all the stock they can.

Manuel Elyre, in his suit against directors in several of the Comstock mines, has been allowed to do to amend his complaint to conform to the rulings or decision of the Supreme Court, reversing Judge Hunt's decision in favor of the defendants. The following are the directors sued for not having the mine superintendent make out his weekly statement or report to the directors, the latter of which the companies are incorporated: Fry, Harmon, Hayes, Hirschfeld, Levy, Lylic, Shackelford, Scott, and Marks. The case comes up before Judge Garver, in Department 1.

News from the Comstock mines continues very encouraging, with reports of improvements in two of the Middle mines, with three of the Gold Hill mines looking more favorable. In the North Star, the news continues of favorable character. The battery assays of Con. Virginia, Savage and Hale & Norcross show a steady gain.

From the outside mines our advices do not report any change in the situation in either the Quijota or Tuscarora districts. From the Bodie district the news grows more important. The mill is kept fully supplied, and the reserve in the main ore chute in the mine, which will hold over 200 tons, is being daily added to. Over 700 tons of high-grade ore have already been extracted from this bonanza.

* Assessment added.

THE MINING AND SCIENTIFIC PRESS of Jan. 30th is a valuable number, and should be in the hands of every friend of the mining industry. Its report of the great Miners' Convention is complete, besides containing other valuable matter.—Georgetown (El Dorado Co.) Gazette.

MECHANICAL PROGRESS.

A Sensational Metallurgical Announcement.

Quite a sensational announcement comes to us from Germany, to the effect that recent experiments of several experts in Westphalia have resulted in the discovery of quite a new process in the production of pig iron from the ore, which bids fair to revolutionize the iron industry of the world.

The application of the electric current in separating iron from its ores has long been known, experimentally, if not practically. But this new announcement consists in the application of the electric current simultaneously with the use of a cheap and easily made acid in such separation. It is said that the experiments were confined to the raw material forming the blast furnace charge, and are said to have proved completely successful, the separation of all metallic substances being rapidly and perfectly effected, and the iron left in an absolutely pure condition. The process is stated to be 80 per cent cheaper than the present blast furnace method.

We have condensed the above from *London Iron*, which journal in its next subsequent issue gives the following:

We are enabled to present our readers with a few further particulars of the electro-metallurgical process, which, according to the German experts who have tested the method, is to revolutionize the metal industry. The announcement of what is claimed to be an epoch-making discovery, is naturally exciting great interest in metallurgical circles on the continent. The *Düsseldorf Zeitung*, which is on ordinary occasions a most reliable journal, is the print which first gave publicity to the sensational news, which it appears emanated from its Berlin correspondent, and this paper has now published a further long article, in which it further refers to the incredulity with which its previous statement has in many quarters been received, and remarks that doubts will in due time be dispelled. After incidentally mentioning that since the publication of the first article it has been inundated with epistolary and telegraphic inquiries, the journal proceeds to state that not only iron, but also other metals, such as gold, silver, copper and aluminum, can be extracted from their ores by the new and infinitely cheaper method. When it is considered, it continues, that the current generated by a dynamo driven by a small gas or petroleum engine will be capable of extracting day for day more metal than the largest blast furnace is able to produce, some idea may be formed of the radical changes which are likely to be the result of the employment of the new process.

Collieries will, of course, be considerable sufferers, as blast furnaces consume a by no means inconsiderable percentage of coal in the course of a year. The invention, which is more rightly described as an electro-technical discovery, was perfected three months ago.

The inventor has succeeded in devising a practical process which has secured the ready support of a number of well-known American and German capitalists, who purpose forming a gigantic international syndicate. Works are to be erected in all metalliferous and metallurgical districts.

The report circulated to the effect that a company had been formed with a capital of \$11,000,000 is not quite correct; this, it appears, is the modest sum at which the inventor was disposed to part with his process, but he has now completed an arrangement by which the utilization of his patent is to be left to the above-mentioned syndicate, his services being retained in the capacity of technical manager.

The statement as to the saving of 80 per cent on the present blast furnace method is said to be no exaggeration. The name of the inventor and his capitalist supporters are to be made known to the world as soon as the letters patent have been granted. And here, the journal adds in conclusion, the matter must for the present rest.

Of course, until further particulars are received, this possibly sensational report must be regarded with a certain amount of suspicion. As above stated, the idea of producing pig iron by the aid of electricity is not altogether novel. Experiments in that direction and on a somewhat extensive scale were made some years ago at an iron

works establishment in Lorraine, but those experiments have been reported as a failure, notwithstanding much direct assistance was received from Mr. Edison, who was then on a visit to Europe. It was found that though the process worked quite well on a small scale, it proved impracticable in the larger attempt made as above.

Economy in Steam Use.

The time has passed when a Watt or Corliss engine, in steam-making economy, could step in and "make two blades of grass grow where but one grew before." Such strides of economy as were witnessed in the early days of steam production and steam-using, have fully passed away and the age of "small economies" is now upon us. The actual economies in the future will depend upon very small improvements in the steam boiler and in the steam engine. The saving of coal in the production of steam at the present day, and during the near future, will depend upon superior boiler construction, furnace arrangement and the manner of feeding the furnace. The latter will ever be an important consideration.

People, says a cotemporary, instead of straining after some new, ingeniously mysterious device which is to save one-quarter of their fuel bill, will be much surer of immediate results if they direct their attention to the saving which is entirely practicable by the use of devices and appliances already available. The proportion of plants which are run within ten per cent of the attainable efficiency is very small; yet see what ten per cent means upon the operation of a comparatively small plant.

Suppose one pound of coal evaporates eight pounds of water, which is better than the average practice; suppose a hundred horse power noncondensing engine uses 40 pounds of steam per horse power per hour. This would call for five pounds of coal per horse power per hour, 500 pounds per hour for the 100 horse, 5000 pounds, or two and one-half tons, per day of ten hours, 750 tons per year of 300 days, and \$3000 per year at \$4 per ton. The saving on this expenditure, with an increased efficiency of ten per cent, would be \$300, or one dollar for each working day.

This percentage of saving is more than attainable on a great majority of plants which are running to-day; and, as we said before, there will be a far greater aggregate saving from an easily attainable increase in the efficiency of the ordinary plant by the use of the "every-day" appliances already at hand than in any record-breaking increase in efficiency in a single plant, accomplished at the expense of the utmost refinement in design, execution and management, however interesting the latter accomplishment may be from an engineering point of view.

COMMERCIAL STEEL, says a contemporary, may be considered as an alloy of iron, and is made by different processes, all of which may be classified under one of three different heads: Process of decarbonization, process of cementation, and the direct process. The elements that compose steel are numerous, consisting chiefly of iron, carbon, manganese, phosphorus, sulphur, silicon, chromium, and many others of minor importance. Carbon is generally found between the limits of 0.2 and 2 per cent, and is either in a free or combined state. The other elements occur, in general, between the following maximum limits:

Manganese,	from 0 to 1.0 per cent.
Phosphorus,	from 0 to 0.1 per cent.
Sulphur,	from 0 to 0.2 per cent.
Silicon,	from 0 to 0.5 per cent.

The characteristics peculiar to steel are chiefly its tensile strength, its property of hardening when heated and suddenly cooled, and its capability of being forged. Its structure is granular, and, in general, the more the steel is worked the finer and more homogeneous its structure. A coarse granular structure is often found in steel made by some direct process from the ore which has been little worked. Steel belongs midway between wrought iron and cast iron, and these three grades of "the irons," as they are sometimes called, have no defined lines of distinction. In general, however, the cast irons will chill, the steels temper, while the wrought irons will not harden at all.

HEAVY RAILS.—The Boston and Albany will use a 95-pound steel rail. The heaviest rail now in ordinary use in this country is a 90-pound rail on the Reading and Manhattan Elevated. The Chignecto Ship-Railway uses a 100-pound rail, and 100-pound rails have been laid in the St. Clair tunnel.

HARVEIZED RAILS.—Since August, 1891, two rails have been lying in the track of the Delaware, Lackawanna and Western Rail-

road at Scranton, which have been treated by the Harvey cementation process, the idea being to have the top of the rail, which is exposed to wear, hard, while the balance of the rail remains soft and is not subject to danger from breakage. The railroad officials report that the Harveyized rails show less wear and flow of metal than other rails subjected to service under the same conditions.

FUEL BRIQUETTES.—A new idea in the manufacture of fuel briquettes is the use of charcoal instead of coal dust. At Fagersta, in Sweden, artificial fuel is now being manufactured out of a paste of charcoal and tar, which is made into slabs about 16 inches thick. These are dried in the air for several weeks, until the water in the tar has disappeared. It is said that these briquettes give as good results as the better grades of English coal for steam-raising purposes.

AN IMPROVED BRONZE.—German foundries are using an alloy of 70 per cent copper to 30 per cent manganese, as a valuable addition to brass or bronze. It is said to increase the tenacity and ductility of the metal if the proportion of three per cent of alloy only be added. An excess of manganese makes the bronze almost as hard as steel.

FOR CUTTING OVAL HOLES.—Machines for cutting oval holes for manholes and hand-holes have for some time been in use in English boiler shops. It is stated that a machine of this kind will cut holes in 20 minutes that would require a day's work by a competent man; a great saving in large shops.

SCIENTIFIC PROGRESS.

The Artificial Production of Rain.

Attempts at the production of artificial rain have been undertaken by many enthusiasts during the last 50 years, but thus far without any decided success. The name of Espy will be recalled by many as one who caused no little interest in this direction from 1840 to 1850. His theory was probably more philosophical than that of any of his successors. His proposition was to effect changes of currents in the atmosphere by means of large fires, producing ascending currents of heated air—the exact manner in which such phenomena are produced by nature. But nothing came of it.

Somewhere about 1859 or 1860, an officer in the French army conceived the idea that rain might be produced by the use of explosives. He had seen much service in Africa and visited France with the view of interesting the Academy of Sciences in Paris to aid him in making experiments, but that body declined to have anything to do with the project. The officer returned to his post somewhat dejected, but resolved to do what he could in demonstrating the value of his theory. Some experiments were made, but on a small scale, and without success. The officer became known as "The Rain Maker of Sahara." He died in 1870, or near that time. His name was Parceau.

The particulars in regard to the recent experiments of Prof. Dyrenforth in this direction, made in Texas, are familiar to our readers. The professor had all reasonable means and appliances which a liberal Government appropriation could furnish, with a selected staff of enthusiastic assistants; but the results seem to have been quite unsatisfactory to the public, although the participants and some of his friends claim partial success. There is no probability that the Government will take any further interest in the matter.

While the Texas experiments were in progress, another "rain maker" appeared in several of the Western States. His process was a secret, and many claimed for him great success. He operated in various localities and in several States, but the public in general gave no credence to his claims.

Within the past few weeks, Mr. O. H. Smith has, according to common report, been conducting a series of rain-producing experiments in this State. Mr. S. is a member of the "Interstate Artificial Rain Company," a corporation organized in Kansas last December. Branches have been in operation in Kansas, at Temple, Texas, and at Pixley in this State. He claims that the efforts to produce moisture have been eminently successful. He has certainly commenced operations in this State at a very favorable time for success, but it is the impression of the people at large that he will have to divide the causes of success with the presiding rain genius of the Pacific Coast, with the honors largely in favor of the latter.

The system of Mr. Smith differs materially from the Dyrenforth plan of discharging explosives. Five chemical compounds are administered as medicine to the atmosphere

by means of a machine, the *modus operandi* of which is secret, as is the entire process. The machine requires to be kept going day and night, and the inventor claims that the only condition causing failure is a thermometer below 40°.

The company claims to have engagements in advance covering the balance of the winter. Huron, in the San Joaquin valley, and Los Angeles are among the points to be visited in this State. Experiments will also be conducted in South Dakota, Eastern Oregon and Colorado.

PHYSIOLOGICAL UTILIZATION OF ELECTRIC CURRENTS.—It is known that continuous electric currents decompose substances placed in contact with the electrodes, the results of which may be new combinations and transformations more or less profound. Proceeding from this standpoint, Dr. Foveau de Courmelles described at a recent meeting of the Paris Academie des Sciences some experiments which appear of a nature capable of furnishing physiological and even therapeutic applications. Thus, if crystals of oxalate of lime be enveloped in a dialytic animal membrane and immersed in a saturated solution of carbonate of lithine, and a continuous electric current be passed, only the insoluble substances will be found externally. Further, if iodide of potassium be injected into the center of a greasy compound, and a continuous electric current be passed, the mass will gradually form itself into clots. We clip the above from a scientific journal, and would add in support of the supposed therapeutic value of electricity that it is well known to many practicing physicians that that agent exercises an important influence upon tumors, both benign and malignant—including cancers—whereby, when accompanied with other assistant treatment, such ailments or aggregations are removed from the system without the use of the knife or caustics.

THE COMING RIVAL IN VALUE OF GOLD. The increased demand for platinum for use as poles in electro-chemical batteries, for crucibles, etc., has raised the price of that metal to a point never before reached, its present value being nearly three-fourths that of gold. Three years ago platinum sold for about \$80 per pound. To-day it is worth double this price, and is eleven times dearer than silver. The metal, says an exchange, which is indispensable in the manufacture of numerous scientific instruments, is only found in small quantities, namely, in the form of platinum ore in Peru, Columbia and Brazil, and in small steel gray grains in the Ural mountains, in this State and in Borneo. The principal source of production is in the Urals. The yearly output has never amounted to more than four tons, and at present it does not exceed three tons. Should not new and more fructiferous deposits be discovered, and this is scarcely probable, platinum will soon be literally "worth its weight in gold."

ANOTHER "LARGEST" TELESCOPE.—Mr. H. C. Williams, editor of the *Millstone*, and an enthusiastic student in astronomy, is said to have contracted for "the largest telescope in the world," to be erected at the Columbian Exhibition grounds. He says it will be an altogether American work and that "the glass makers of the United States are to manufacture the disk." There is no doubt but that Mr. Williams and the "glass makers of the United States" may be able to construct the largest telescope in the world; but will it have the value of any of the 4 or 5 inch instruments such as are found in almost every town of any considerable importance in the Union. The size of a telescope counts for nothing without a corresponding skill in its manufacture and mounting. All the telescope makers in the world would be unable to manufacture and mount such an instrument as Mr. Williams is said to propose, between this time and the opening of the World's Fair at Chicago.

ROCKS ARE DISINTEGRATED by vegetable organisms as well as by atmospheric agencies. It is well known and distinctly observable that plants of various kinds fasten themselves and grow from the surface and fissures of rocks. In their growth, they gradually assimilate such substances in the composition of the rocks as are needful for plant growth, and thus the hardest rocks may be gradually disintegrated.

MINERAL ULTRAMARINE has been discovered by Prof. Merrill of the Smithsonian Institute near Silver City, Colorado. This mineral has heretofore been found only in a few localities in Asia. Previous to the year 1814, this pigment was worth more than its weight in gold. It has since been gradually reduced in price, chiefly by artificial compounds which have taken the place of the natural mineral.

ELECTRICITY.

The Electric Railroad.

Great as has been the progress of improvements upon the electric railroad, and rapid as has been the extension of the system during the past two years, the indications are that such advances will be greatly exceeded during the next two or three years to come. The electric railroad is as yet in its early infancy, but its adaptability as a short route and cheap transportation agency, for both freight and passengers, has been fully proven.

Economy in this direction seems to be found in equipping such roads with light freight and passenger cars, the former carrying about five tons each. The cost of constructing and equipping such roads over a level country is a mere moiety of the cost of the ordinary steam railroad. So cheap are they, both in construction and operation, that almost every little farm neighborhood may have its local road as a feeder to the main line, by which the cost of transportation of produce to market may be greatly lessened. With a wide-reaching system of such roads in the valleys of California, our farmers would be completely emancipated from the extortions of the existing short haul systems which are acting as such a great incubus upon them that farming is utterly unprofitable except in certain favorable localities.

Suburban electric roads can be built and equipped for about \$10,000 per mile, which is the estimated cost of such portions of the roads now being constructed around the bay between this city and San Jose. Of course, when such roads pass through a hilly district, that portion of the route will be proportionally enhanced. In districts where water power can be employed to generate the electricity the cost of running them will be a mere song, as compared with steam. Such roads will not run long trains; two or three cars only will be run together, and at frequent intervals. As soon as the several roads of this description now in course of construction near this city are fully under way, their success, which is well assured, will engender an interest in this direction that will no doubt effect a speedy and most welcome revolution in transportation matters throughout all the great valleys in California. The merchants in all our cities and large towns will be no less benefited than the farmers at large.

This country is not the only one which is moving in this direction. The same hopeful experiments are being made in various parts of Europe. In Austria, what will probably be the most extensive electric railroad in the world, is now in an experimental way of evolution. This road is one on which, instead of trains, single cars of great length will be propelled by electricity supplied to them through the rails. The speed hoped to be obtained is from 120 to 150 miles per hour. To provide against accidents the roadway is to be built on solid masonry, without curves, steep gradients being adopted instead, if necessary. The great momentum of the cars will enable them to climb grades which would be insurmountable to a steam locomotive. As a further safeguard, the signalmen will have the power to stop the cars by shutting off the current in their section of track. The first experimental line is projected between Vienna and Budapest.

THE ELECTRIC LIGHTING OF TRAINS.—Electrically lighted trains are now rather the rule than the exception in Switzerland. The Jura-Simplon Company is fitting all its new carriages with the electric light, and a number of the old vehicles have been furnished with accumulators and glow lamps. The batteries are charged at Freiburg, which place, as we have previously had occasion to remark, supplies electricity at a cheaper rate than any other town in Europe. Each morning a number of vans of freshly charged accumulators leave Freiburg for the principal stations on the company's system, where the freight is distributed in exchange for the accumulators which have been doing duty in the preceding night in the various trains. In proportion, there are more electrically illuminated carriages in Switzerland than there are gas-lighted vehicles in France.—Ex.

"THE DEADLY WIRES."—Of course there is danger all around us, whether we walk the streets or lie quietly in our beds; in whatever vocation we may be engaged, we are never out of danger. The "deadly wires" have been harped upon lately, as a most unusual and unnecessary source of danger. True, many accidents have been due to them, but in far the greater number of cases such accidents have been the result of

carelessness or ignorance. But the wires have come to stay, and people must be educated up to a knowledge of how to put them up properly, how to handle them and how to avoid needless contact with them. Every observing newspaper reader must have noticed how great has been the reduction of accidents during the past year, and that too when the number and extent of the wires has been vastly increased. People are becoming educated. In no city has the cry against the wires been louder or more persistent than in New York, but little, however, is heard of it of late. Instead, we find in a late New York journal the following significant paragraph: "Mayor Grant, in his annual message, points out that only one death through overhead wires occurred in New York City in 1891, and that was due to the fall of a telegraph pole. There are now 143 high tension circuits, making 528 miles of electric light conductors underground, and 383 miles of low tension lighting in the Edison circuits. Mayor Grant recommends the establishment of a central municipal telegraph and telephone exchange.

THE SANTA ROSA AND PETALUMA ELECTRIC ROAD is sure to be inaugurated. Judge Barnum of Santa Rosa is quoted by the *Courier* as urging the early construction of the road by local capitalists and saying: "I am informed that the people of Petaluma are discussing this proposition and have the money to build the road if they want to. I will say this much: if your folks don't wake up and build the road I am positively informed that an English syndicate will. It would be better for Petaluma and Santa Rosa to own and operate the road, but you just mark my words that these English capitalists have their eye on the proposition, and the road will be a consummation within the next two years. If there is anything in it, and I believe there is, it would be better for our own people to reap the benefit of the enterprise."

THE TROLLEY SYSTEM of traction for street railways has been strongly opposed by the Mayor of Brooklyn, N. Y. He has once vetoed a resolution passed for that purpose, but the people seemed to demand such a concession and he has, more recently, wisely consented to the passage of a second resolution lately presented, and the work will now go ahead. Public opinion in several large Eastern cities seems to be favorable to the adoption of the "trolley system" as an economical method of traction, while railroad men are waiting for the devising of some better and permanent method. The horse must go; the cable is too expensive, and we must make the best use we can of electricity. The trolley now—something better further on.

THE SAN MATEO ELECTRIC CARS.—The cars intended for the San Mateo railroad, 15 in number, have been taken out to the carhouse at Sunnyside, near the old San Jose road. They are constructed in the same style as those on the California cable road—dummies at both ends—only smaller. They will be lighted as well as driven by electricity. This road will soon be in operation, and will exchange transfers with the Market Street, the City and the Central railway companies, so that one ticket will take a person from almost any part of the city to the park and to the cemeteries in San Mateo county.

THE NEW JERSEY ELECTRIC RAILROAD, to be constructed by the Pennsylvania Railroad Company, as noticed in these columns last week, is already under construction, work thereon having been commenced about the first of January. This, it is to be recollected, is to be a high-speed road and will run parallel to a steam road, with which it may be directly compared, both in relation to speed and economy.

ELECTRIC RAILWAYS IN ENGLAND.—The outlook for electric railways in England seems to be bright. The Brush Company is reported to have some very important and valuable contracts on hand, among which is the application of electric traction to the Liverpool Overhead Railway, and the South Staffordshire Tramway Company.

GOVERNMENT CONTROL OF THE TELEPHONE.—The Government of Belgium, some time last fall, notified the Bell Telephone Co., whose instruments are now used in Belgium, and which is at present doing all the telephone service, that on and after the 1st of January, 1892, the Government will assume and conduct the service.

WORK COMMENCED.—Work has already been commenced for transforming the Oakland Telegraph avenue horse railroad to an electric road.

ENGINEERING NOTES.

Oakland Water Front Improvements.

The memorial to Congress, in reference to the harbor improvements across the bay, adopted at the late bridge celebration there, recites at considerable length the history of that improvement. The project first took shape in 1873, when a board of engineers recommended improving the harbor by dredging the estuary, between Oakland and Alameda, to a depth of 14 feet at low tide, connecting it westward with the bay of San Francisco by a ship channel of similar depth, and 300 feet wide in the center of a channel 800 feet wide, protected on either side by stone jetties, projecting westward out into the bay of San Francisco a distance of about two miles. To keep this channel open, the plan included a canal 400 feet wide across the narrow neck of land which connects the peninsula of Alameda with the mainland. The estimated cost of the whole work was \$1,813,529. This sum, however, was based upon the assumption that the funds would be provided so that the work might be kept along continuously, without any stoppage, which latter would, of course, entail much additional expense. Instead of continuous work the appropriations were dealt out in dribs and drabs from year to year, from 1874 to September, 1890, at which latter date \$1,534,000 had been expended on broken periods of work. After the work had thus progressed 13 years, and \$900,000 had been expended, the further cost was reestimated, and the sum of \$1,590,000 fixed as necessary for its full completion, an addition of \$676,479 to the original estimate—a large portion of which additional amount was incurred by the parsimonious manner in which the appropriations had been made.

Of the second estimate, \$600,000 have been expended up to the present time, leaving \$990,000 of the second estimate to be appropriated and expended. Should Congress provide the funds as fast as needed, to admit of the work being carried on continuously, the contemplated improvements might be completed in two years. If, on the other hand, the appropriations are to be allowed to drag along, making frequent stoppages necessary, it will be many years before the long hoped for benefits from the work can be realized, and 30 to 40 per cent will have to be added to the second estimate.

It seems quite unaccountable that a great and rich government, which always has at hand all the material and capital required to carry out improvements acknowledged as necessary, should dally along with the work, now stopping and breaking up or scattering the plant, which has to be renewed at great extra expense at the next spurt of work, and so on for years, occupying 20 or 25 years in accomplishing a work that could and should have been done, with continuous labor, in less than ten years. In addition to the unnecessary expense of say, at least, 25 per cent for delays, a large amount of interest must be added and lost or paid by some one, for the money expended and lying idle for 10 or 15 years of delay.

Perhaps it should be accounted for as a result of our mischievous political system, of delays and hindrances, so that opposing parties or bosses may work their way in to handle and profit by the expenditure of the public moneys. We trust the time will soon come when partisan politicians will be relegated to back seats, and the legislation and governmental work of the country will be conducted upon honest business principles.

PROPOSED NEW SHIP CANAL.—The project for a ship canal across New Jersey, to connect New York harbor and Long Island sound with Delaware and Chesapeake bays and their tributaries, was discussed at the annual meeting of the New York Board of Trade and Transportation on the 14th of January.

Prof. Haupt, of the University of Pennsylvania, gave a brief description of the project, which provides for a channel of 33 miles in length, with three locks on either side of the summit level, which would be 50 feet above tide. The cross section is estimated to be 90 feet at the bottom, 150 feet at the surface and 20 feet deep, with locks 500 by 60 feet. The total distance would be about 90 miles from New York to Philadelphia, thus connecting by the cheapest known method of communication the most populous centers of the United States, at an estimated cost for the entire line of \$12,500,000.

Mr. Martindale said: "We believe that through the completion of this canal, your supply of anthracite coal (of which you used in New York and Brooklyn last year over 6,000,000 tons) will be delivered to your wharves at a saving of nearly \$3,000,000 per

annum, making a goodly return on an investment of over four times the amount required for the completion of the project."

GOOD HEALTH.

INDIAN SURGERY.—It is a mistake to suppose that the Digger Indian is entirely ignorant of how to proceed in cases of broken bones. A correspondent of the *Scientific American*, who once had some experience in sawmills in California, writes that journal as follows: On one occasion, while a number of Indians were curiously watching the operations of the mill, and standing near the double-flue boiler to keep warm, one of the flues suddenly collapsed in such a manner as to fatally scald one of the owners and hurl a poor old Indian woman some 20 feet away, breaking one of her legs below the knee. In the excitement of the occasion and the necessary care of the injured owner, the injury sustained by the woman was not observed and she was taken quietly away by the other Indians. Three or four days later quite a large number of Indians appeared in a hostile attitude on a near-by elevation which overlooked the mill. After taking their station, a tall chief approached and inquired for the "sawmill man," complaining that he had "shot off his sawmill" and broke the leg of a *mahale*, and he, the chief, was ready for a fight. The foreman took in the situation at once, invited the chief into the house adjoining, and showed him the stricken owner in the agonies of death. The chief then, in his turn, took in the situation from the opposite standpoint, and immediately exclaimed: "No intendi, accidenti. Me safe, no fite, all wano." We now append the interesting and surgical part of the story as given in the *Scientific American*: In a day or so after Mr. Hoxey's burial, the surgeon went to the *campudia*, and there sat the poor broken-legged *mahale*. The physician told me that the Diggers measured around the leg in several places, then cut a piece out of a slippery elm tree, near the size and shape of the leg, took the bark off, shaved off the outside and made as fine a splint as he ever saw, and fitted it around the broken limb, leaving the space open about one quarter of an inch on the top, and were pouring in a little water to keep down the fever heat, and that in a few weeks the squaw was limping around town again.

WOMEN AS DOCTORS.—The increase of women doctors in the city has been very marked lately, and several of them are now admitted as staff physicians at the hospitals and dispensaries. One great advantage that they seem to have over their rivals of the other sex is that they can tack out their sign and then go as professional nurses until business comes to them. The male doctor frequently has to starve through a course of a year or two, and then he frequently fails to make enough to keep the pot boiling. Women doctors are generally proficient nurses, and they are trained by nature and study to care for the sick. They can take a patient and prescribe for him, and then watch by the bedside until all is over. At the end double fees are demanded—the regular doctor's fees for prescribing and then the nurse's salary for watching and nursing the patient according to the prescriptions made out by herself. There is no doubt but a great advantage is obtained in this way, and the nurse and doctor are both held responsible for any mistake. Among babies and women the female doctor has a field which she is gradually making a specialty.—New York Times.

LIGHT IN CHILDREN'S BEDROOMS.—A medical writer says: If mothers notice that the brains of their little ones conjure up uncanny sights and thoughts from the shadows of a room more or less dark, let the light burn brightly. To force a child to become accustomed to the darkness is a grave error, if its nervous system is so organized that this forcing is productive of fright. The nervous system of a child is a very susceptible organization, and the deleterious impressions made upon it will often make their influence felt throughout its whole after-life. If the child asks for a light under such circumstances, *do not refuse it*.

SHOWER BATHS.—Many people advocate the shower bath, but few constitutions can stand it; in fact, it is highly dangerous to many persons of weakly habit, for they have no reactive power. Says a clever writer on this subject: "Every change in our growth and development is slow and gradual. If nature approved of sudden changes, she might make a man bald in a single night. We cannot stand shocks, and I don't believe we were ever intended to."

SAN FRANCISCO:

SATURDAY, FEBRUARY 13, 1892.

TABLE OF CONTENTS.

EDITORIALS.—Old and New in Hydraulic Practice; A Foundry Purchase; The Miners' Movement; Miscellaneous. 113. Passing Events; The Profits of Comstock Mines; A Self-Appointed Representative; Timbering Drifts by English Method, 120.
ILLUSTRATIONS.—The Great Overshot Wheel at Laxey, Isle of Man, England, 113. Timbering in Drifts, 121.
MECHANICAL PROGRESS.—A Sensational Metallurgical Announcement; Economy in Steam Use; Commercial Steel; Heavy Rails; Harvested Rails; Fuel Briquettes; An Improved Bronze; For Cutting Oval Holes, 118.
SCIENTIFIC PROGRESS.—The Artificial Production of Rain; Physiological Utilization of Electric Currents; The Coming Rival in Value of Gold; Another "Largest" Telescope; Miscellaneous, 118.
ELECTRICITY.—The Electric Railroad; The Electric Lighting of Trains. "The Deadly Wires"; The Santa Rosa and Petaluma Electric Road; The Trolley System; The San Mateo Electric Cars; The New Jersey Electric Railroad; Electric Railways in England; Government Control of the Telephone; Work Commenced, 119.
ENGINEERING NOTES.—Oakland Water Front Improvements; Proposed New Ship Canal, 119.
GOOD HEALTH.—Indian Surgery; Women as Doctors; Light in Children's Bedrooms; Shower Baths, 119.
CORRESPONDENCE.—Mining in Arizona; Concentrators at the Tyro Mine, 114.
MISCELLANEOUS.—Geary's Mining Bill, 114; River Beds, Do not Grow Now; No Money for Miners; Impounding Debris; Mining Department at the World's Fair; The Last Chance Wins, 115.
MINING SUMMARY.—From the Various Counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 116-117.
MINING STOCK MARKET.—Sales in the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, etc., 124.
MARKET REPORTS.—Eastern and Local Metal Markets; Coal and Coke, etc., 124.

Passing Events.

The Miners' Association Committee to Congress left this week for Washington, where they will join the committee from the River Improvement Convention, and work for the common cause of improvement of California rivers and the construction of debris dams.

Several of the mining counties are preparing to organize permanent miners' associations as branches to the California Miners' Association. With this course pursued all over the State, a very strong organization will be perfected, which will be of great benefit to the mining interests.

The movement started by the recent Miners' Convention is meeting with universal favor, and the work is going on well in every direction. The various bodies, such as the Board of Trade, Supervisors, Chamber of commerce, etc., have taken the matter up in a favorable way and have lent their moral support, which will be valuable to the committees in Congress.

THE Yuba County Supervisors have given \$300 toward paying the expenses of the Miners' Committee to Washington. The Amador County Supervisors have also given \$100.

THE discovery is reported of a big vein of tin in the mountains about 50 miles north of Denver.

EL DORADO COUNTY is about to organize a County Miners' Association.

The Profits of Comstock Mines.

The evidence of Alvinza Hayward and W. S. Hobart, given on Feb. 8th and 9th, in the Hale & Norcross mining suit, shows that they, as mill owners, paid H. M. Levy, president of that company, about \$30,000, or one-eighth of the net profit of all the Hale & Norcross ores worked by the Nevada and Mexican mills for the years 1888-1889, up to June 30th, 1890.

As the mills worked between 79,000 and 80,000 tons of ore during that period, Levy's one-eighth shows a profit of \$240,000 to the mill company; and during all that time the managers of the mining company were assessing the stockholders of the mine. In other words, the rings got the bullion while the stockholders had the assessments for their share.

Mr. Baggett declared the plaintiff's case closed, and Mr. Wood, the principal attorney for the defense, promptly moved for a nonsuit, setting forth in addition to the usual statutory grounds that there was no evidence of conspiracy.

Judge Hebbard said: "That the Hale & Norcross has been defrauded out of a large amount of property there is no doubt in the mind of the Court, and there is a prima facie case of conspiracy as against the Hale & Norcross stockholders made out. The motion for a nonsuit is denied."

Is it any wonder, with such a record as this, exposed under enforced judicial inquiry, that the mining stock market of this city has gradually run down to a mere nothing from its former proportions? The mine managers, often with but a few shares of stock, and drawing salaries, instead of promoting the interests with which they are entrusted, promote their own interests in every way. They individually profit by the milling of the ore, while the stockholders of the mining company furnishing the ore, have to pay assessments to keep the mine running.

While such a record as this is an infamous one, it is, at the same time, a common one. There is nothing especially new or startling about it, except that the individuals engaging in such conspiracies are compelled to avow publicly their share in the transaction. Everybody suspected, or knew, the facts long before. And what is true of one mine may be, and probably is, true of many others.

Such a state of affairs accounts, in part, for the low esteem in which mining property is held on this coast, as compared with other property. With such prevalent dishonesty how could any business be conducted and prosper? And yet, these men who do these things find defenders on the plea of custom. It is only a pity that it is not also a custom to send people to the penitentiary who commit such breaches of trust, and allow business they are paid to manage to lose money, while they themselves make it.

There is little doubt that the principal Comstock mines, honestly and fairly managed, as are the principal gold mines of California, would pay the stockholders good profits. But under the monstrous system which has grown up with years, the dividends are few, while the assessments we have always with us. Meantime, a self-chosen few have grown wealthy, their riches being gathered from deluded investors and wrecked mines. The properties are worked by the so-called managers in such a way that they obtain profits, while the stockholders pay the expenses and receive no returns.

But it is all an old story, which has been periodically retold. The men of influence and wealth are arrayed in favor of the unwholesome system; so it stands. Their interests are involved. Those who would see a better state of affairs are unable to bring it about. Some time, of course, the end will come, but meantime the stockholders are impoverished. The stock market is a ten-cent gamble, the mines are being worked out, and the business as a whole brings the mining industry generally into disrepute. It will not be until those who are criminal conspirators in such schemes are brought up with a round turn, and sent to San Quentin, that the moral atmosphere surrounding Comstock mining will be cleared.

A Self-Appointed Representative.

The Executive Committee of the California Miner's Association felt rather chagrined on Tuesday morning when they read the following paragraph in the dispatches from Washington:

Californians occupied about an hour to-day in presenting their claims before the House Committee on Rivers and Harbors, arguing for a thorough system of river improvement that would place that branch of public works on a systematic and permanent basis. Mr. Devlin of Sacramento made a statement of the needs of the people on navigable streams, and furnished the committee with data and arguments that have heretofore been printed in California. Mr. Trumbo represented the miners of the State, and in an argument showed the importance of the mining industry, illustrated how it was handicapped, and asked for the construction of dams and other works that would permit the miners to work without injuring any other industry or class of people.

It happens that the Miners' Association Committee is on the train on the way to Washington to officially represent the miners of the State, and in their absence, Col. Isaac Trumbo, of this city, took the opportunity of airing his eloquence before the River and Harbor Committee. Now, the miners of California very decidedly object to Col. Isaac Trumbo, or any of his class, representing them on this or any other occasion. He has, doubtless, a perfect right to represent himself and appear before such a committee on his own behalf, but when he poses as representing the miners of the State, he does so only on self-constituted authority.

This man is just one of the class who wants to "get on and ride" with any successful movement, and he and his kind need to be promptly "sat on." He tried to get an appointment as a delegate from San Francisco to State Miners' Convention, and failed. He tried to be appointed on the Executive Committee of the California Miners' Association, and failed. He tried to get an appointment of honorary member of the Committee, so as to appear at Washington, and failed. A few influential men, who knew him slightly, spoke for him and wrote for him, but in vain. The mining men connected with the movement remembered the famous Sucker Flat mining transaction, and wanted none of Col. Isaac Trumbo. So, despite his efforts, he had nothing whatever to do with the miners' movement.

Imagine then, the man's monumental cheek, under these circumstances, when he goes to Washington and appears before the Committee "representing the miners of California."

In order to prevent any misunderstanding on the subject, and to place the delegation which left Tuesday in a proper light on their arrival at Washington, as the duly appointed and instructed delegates of the convention, the following dispatch was immediately forwarded to Judge Niles Searls and the delegates accompanying him:

SAN FRANCISCO, Feb. 9, 1892.

Judge Niles Searls:—Trumbo, without any authority, appeared before the Committee on Rivers and Harbors yesterday at Washington, representing himself as representative of the miners of California. This morning sent the following telegram to River and Harbor Committee, to Senators Felton, McKenna and other members from California:

"Colonel Isaac Trumbo is not a delegate from the California Miners' Convention; not a member of California Miners' Association. Has no authority to act for either body. Our delegates left for Washington last night."

[Signed,] W. C. RALSTON,
Secretary Miners' Association of California.

The several committees of miners and farmers had agreed upon a plan to carry out in Washington about which this Colonel Trumbo knew nothing whatever. Such a man as this, having no standing in the mining community, would do more harm than good in advocating a cause. California, like other mining States has always been cursed by a class of mining promoters, posing as practical mining men, who come to the front on every possible occasion. Their connection with various mining schemes has given them some little notoriety in connection with the industry, and they seek self-advancement on this basis. If Col. Isaac Trumbo, for instance, desired to "place" a mining property abroad, if he could show a clean bill from the French investors in the Sucker Flat mine, he might accomplish his object; otherwise, he probably

could not. Whether he has a mine for sale now or not, is unknown; but at all events, it will be well for him to cease attempting to represent the miners of California, their association having repudiated him promptly on the first occasion offered.

Timbering Drifts by English Method.

In recent numbers of the PRESS, the various plans tried for timbering bad ground in the tunnel of the Croton aqueduct have been described. Those thus far referred to were all failures. Then an entire change in the management took place and M. Nolan was appointed foreman in charge. The English system was introduced and the work was completed without serious interruption in a year and two months.

The entire excavation made was allowed within the limit of 676 square feet, or 26x26 feet. This permitted the placing of a 2-foot timber platform and 24 inches of brick masonry. The average area excavated was 507.7 square feet.

The first two stretches of 13 and 12 feet occupied respectively 20 and 12 weeks. Against advice, a top-central drift was first run about 18 feet, and, as the rock was found on the west side, the widening was done from west to east; about 15 crown bars were placed and a bulkhead built. The bench was then removed to 4.2 feet below grade. A platform two feet thick, formed of cross and longitudinal timbers, 12x12 inches, was built. Upon this the invert was laid and the masonry completed.

Widening out the second stretch, several of the crown bars on the east side broke and the weight of the ends resting on the masonry arch caused it to crack for eight feet. This difficulty was overcome by supporting the arch with oak centering, and also by placing a large 24-inch longitudinal timber in the center, supported by posts about 6 feet long from the invert and mud sills. From this, radial pieces were placed to the crown bars above. Finally, the bottom was removed and the platform placed. The cracked portion of the arch was subsequently rebuilt.

Top drifts were still persisted in, both here and in the heading from Shaft 13 A, which had now reached the other end of the soft ground; but after two weeks' further trial, the foreman was finally forced by the mud, sand and water, to abandon them.

As above mentioned, the English system was finally adopted, and the following is a description of its application:

The beginning was made four feet north of the soft ground. The first 54 feet were worked from the top down; the remaining 60 feet, from the bottom up.

Referring to shaft 13: On January 28, 1888, the excavation and masonry had reached 778+45, and a small preliminary bottom drift, 2 feet by 3 feet, was driven through, connecting both headings, and the top drift from the driving of the previous section was at Station 778+55.

The First Operation.—The lower drift was enlarged to 6 feet by 8 feet for a distance of 25 feet. (A, Fig. 1.)

The Second Operation.—Widening out of the drift. Bearing bars (B, Fig. 1), 20 feet long, were placed under the caps, and supported by posts, resting on longitudinal sills bb. The operation of widening out, on either side as most convenient, was then done, and the bars, posts and sills (c, c, c, d, d, d and e, e, e) placed. The process of widening is shown on the left of the drawing, Fig. 1.

The Third Operation.—The placing of the timber platform. The previous operation being well advanced or completed sheet-piling was driven down 5 or 6 feet outside of the sills b, b, e, e, etc., and the enclosed spaces were excavated in pockets to a depth of 4.5 feet below invert grade for a length of 18 feet, and as wide as possible, generally 10 or 15 feet. Posts b', e', etc., placed at intervals measuring 7 feet (Figs. 1 and 2) resting on foot boards in the mud, now support the system. Sheet-piling

(F, Fig. 2), 3 or 4 feet long, was then driven across the bottom of the excavation about 15 feet in advance of the completed invert. This prevented the mud from being pumped out from beneath the platform during the construction of the succeeding section. The longitudinal sills G, in variable lengths up to 15 feet, were then placed in the excavated spaces between the posts b' , b' , b' , etc. Underpinning was then employed in order to get the longitudinal sill in the space interrupted by the line of posts. Immediately behind the first post, a cross sill (H, Fig. 1) 6 feet long was placed on blocks 6 inches above the sills in place. The weight was transferred to this and the first post removed. The second post was removed in a similar way. The third post was supported by struts (X, Figs. 1 and 2). The sill G in the vacant space was in half lengths and was slipped into place as shown in Fig. 2. The cross sills H were then placed. The sills put in were as long as circumstances would allow, and arranged to break joints. The posts e' (Fig. 4), on the outside, could seldom be removed, and longitudinal pieces

FIG. 1.—SUCCESSFUL ADVANCE OF DRIFT BY ENGLISH METHOD.

supported by the posts, P (Fig. 5), resting on the cross-sill, O, and two longitudinal sills, N, placed in the top-heading (Figs. 3, 4 and 5). The excavation was carried down and out at the same time, and the other bars were supported by the struts, Q, resting on the bearing bars, B, C, etc., (Fig. 3). The large beam, S, (Figs. 4 and 5), 24 inches by 24 inches, 26 feet long, was then placed ahead of the invert, and supported by posts resting on sills in the bottom, and strutted back to the invert by the rakers, u. Posts, T, were placed under the crown bars and set upon this sill, which also served as a bearing for the bulkhead against the mud in the face. When the section was completed, the sill was cut off and removed, the ends being built in. To support and strengthen the crown bars, the segmental timbers, v, supported by posts resting on foot-blocks on the masonry already built, were put in, one or two feet apart as necessary. The sidewalls and the arch were finally constructed. No attempt was made to withdraw the crown bars.

This was the general order of operations,

FIG. 2.—PROGRESSIVE TIMBERING BY ENGLISH METHOD. LONGITUDINAL SECTION OF FIG. 3.

FIG. 3.—PROGRESSIVE TIMBERING BY ENGLISH METHOD. CROSS SECTION THROUGH FIG. 2.

FIG. 4.—COMPLETION OF TIMBERING AND SETTING OF INVERT.

FIG. 5.—LONGITUDINAL SECTION THROUGH FIG. 4.

were placed between them. The excavated space ahead of the platform was used as a sump for pumping.

The Fourth Operation.—The platform being completed, the cross beams, J (Fig. 15), supported by the inclined posts, k, k, were placed about 3 feet between centers under

the bearing bars, B and C, and well wedged up. The posts and sills, b, b, d, e, and e', were removed, and the central portion of the invert built between K K, which were replaced by L L (Fig. 3), and the remainder of the invert and 2 feet of side wall and backing was built (Fig. 4).

While the masonry was being built, the top-heading, M (Fig. 3), was advanced 15 feet to + 70.

The Fifth Operation.—The crown bars, R, R, etc., (Figs. 3 and 4), were placed. The back ends rested on the arch already built, and the heading ends of the first two were

which were varied in their successive stages according to circumstances.

According to a most liberal estimate, including the cost of sinking shaft 13 A, the cost of 110 feet was at the rate of \$416 per foot. The amount paid for this work was at the rate of \$539 per foot.

A New and Valuable American book for Prospectors and Miners.
JUST READY.

The Prospector's Field Book and Guide

In the Search for and the Easy Determination of Ores and other Useful Minerals. By Prof. H. S. Osborn, LL.D., author of "A Practical Manual of Minerals, Mines, and Mining." Illustrated by 44 engravings. 12mo, 175 pages. Price \$1.50, by mail, free of postage, to any address in the world.

CONTENTS.—Chapter I. Preparatory Instruction. II. Crystallography. III. Surveying. IV. Analyses of Ores. V. Special Mineralogy. VI. Platinum, etc., Silver. VII. Copper, and How Measured by Ores. VIII. Lead and Tin. IX. Zinc, Iron. X. Mercury, Bismuth, Nickel, and Cobalt. XI. Aluminum, Antimony, Manganese, and other Minerals. XII. Precious Stones. Appendix, Correction of Weights and Measures, Prospector's Pointers, Index.

BY THE SAME AUTHOR.

Recently Published.

A PRACTICAL MANUAL OF MINERALS, MINES AND MINING

Comprising suggestions as to the localities and associations of all the Useful Minerals; full descriptions of the most effective methods of both the qualitative and quantitative analyses of each of these minerals, and hints upon the various operations of mining, including architecture and construction. By Prof. H. S. Osborn, LL.D. Illustrated by 171 engravings. 8vo. 367 pages. Price \$4.50, by mail, free of postage to any address in the world.

Descriptive circulars giving the full tables of contents of the above books sent free to any one who will send his address.

A New List of Leading Books on Metal Mining, Metallurgy, Mineralogy, Assaying, Chemical Analysis, Geology, etc., sent free to any one, in any part of the world, who will send his address.

Our new and revised Catalogue of Practical and Scientific Books, 83 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass, Zinc and other metals punched for all uses.

Inventor and Manufacturer of the celebrated Slot Cut or burr and Slot Punched Screens.

Mining Screens a specialty, from No. 1 to 15 (fine).

Orders promptly attended to.

San Francisco Pioneer Screen Works,

221 & 223 First St., San Francisco, Cal.

JOHN W. QUIOK, Proprietor.

The Best Mining District On the Pacific Coast!

GRASS VALLEY, CAL.

THE BEST NEWSPAPER published in this district is

THE TIDINGS.

Daily and Weekly edition. Gives all the Mining News. Dealers in Mining Machinery and Mining Supplies will find THE TIDINGS the best medium for directly reaching the owners or managers of mines. Investors in mines will find it to their advantage to subscribe.

Many mines are in successful operation, and new enterprises are being instituted and many others are in contemplation.

DAILY, \$8 00 a year; WEEKLY, \$2.50, in advance.

H. S. SPAULDING, Publisher.

T. C. HOCKING, Editor.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, FEBRUARY 11, 1892.

General trade continues quiet, but the conviction strengthens that a change for the better is near at hand, provided the weather continues in farmers' favor. The money market is essentially unchanged. Commercial and savings banks report large reserves on hand with a light inquiry ruling. This condition of affairs obtains in the East also, as mail advices from New York report that on January 30 the banks had a total of \$163,339,100 in specie and legal tenders, against a similar total of \$126,704,300 a year ago, and of \$121,565,600 the first Saturday of February, 1890, largely exceeding that of any reserve heretofore held by the banks of the city. The increased general stock of currency in circulation must necessarily be taken into calculation. Another fact observed is the disposition of farmers and those who have profited from agriculture to apply the proceeds of sales to the removal of indebtedness rather than to contract new liabilities. In Boston this is noticed as being particularly true of the Central States, where dealers are carrying light stocks of goods and this is regarded as an omen of activity in mercantile circles later on. Regarding the situation in New York investment circular remarks that with such accumulations of capital and with a very large part of our enormous crops yet to be sold and paid for, there is reason to believe that improvement is near at hand. While the above is true of this country, European advances up to Feb 2 state that at London, call money was firmer at 1 1/2 per cent, with a loan and a bid to get even at 10 per cent, because of the unsettled condition of financial affairs in Europe. Bankers in the United Kingdom and on the Continent not only hesitate to make new loans on export staples, but are calling in old ones as fast as possible, as a precaution against emergencies. The trouble is not believed to be serious, but it is certainly worthy of note.

QUICKSILVER—Receipts of the bulk week aggregate 332 flasks, and exports 75 flasks, to Mexico. The market is reported steady at current quotations.

MEXICAN DOLLARS—Market is dull at 71@71 1/2 c.

SILVER—The market in New York fell to 89 1/2 c on last Monday, but to-day it is quoted at 89 3/4 c. These are the lowest prices touched within the history of the trade. No one appears able to give a reasonable solution of the influence at work in bringing about such a state of affairs. The Mint purchases not only continue to absorb this country's production but gradually reduce the reserve stock. The House Committee on Coinage, Weights and Measures reported on yesterday practically a free coinage bill. The bill provides that "the unit of value in the United States shall be the standard silver dollar as now coined, 423 1/2 grains of standard silver, or the gold dollar of 25 3/10 grains of standard gold; standard gold and silver coins of the United States to be legal tender in payment of all debts. Any holder of gold or silver bullion of the value of \$100 or more of standard fineness shall be entitled to have the same struck into any authorized standard coins of the United States free of charge at the Mints of the United States, or may deposit the same at such Mints and receive therefor coin notes equal in amount to the coinage value of the bullion deposited, and the bullion shall become the property of the Government, the coin notes so issued to be in denominations of not less than \$1 nor more than \$1000, and to be also legal tender." The Act provides for the retiring of outstanding gold or silver certificates or treasury notes. Commenting on the bill Representative Brand says that "the bill is different from all others introduced in one particular: it contemplates the converting of all our silver money, silver certificates and treasury notes issued on bullion, and gold certificates issued on gold, into coin notes, redeemable in coin, thus converting our paper into a bimetallic paper, instead of keeping up the distinction between gold and silver in our paper issues. This conforms to the idea of coining both metals on an equality, gold and silver both being free."

BORAX—Receipts the past week aggregate 365 cts., and exports by sea 110,841 lbs. The market is fairly steady.

LIME—Receipts the past week aggregate 2910 hhls. Exports to Honolulu continue free. The home demand appears to be enlarging.

COPPER—The market is easy at current quotations. New York *Iron Age* says: "Prices are now down to a level that leaves numerous small producers little or no margin of profit, and a further depression in values, according to current reports, would cause some of those concerns to either suspend operations or impair their finances. Copper keeps coming upon the market from some source or other in greater quantity than is needed to satisfy current wants."

LEAD—The market is reported essentially unchanged. Eastern advices report a slow market.

TIN—In both pig and plate the market is reported inactive.

IRON—The market holds to strong prices owing to free consumption in this State and up north reducing stocks. If the present prospects for a large wheat crop in this State continue to hold in the spring months, then large shipments to this coast of iron will be made from England in vessels coming here for outward cargoes.

COAL—Imports the past week aggregate as follows: Departure Bay, 4742 tons; Seattle, 7450; Comox, 4150; Nanaimo, 2373; Coos Bay, 760; total, 19,467 tons. The market continues overstocked. Owing to the favorable outlook for wheat crops on this coast, coal importers do not appear disposed to take up vessels for loading in Australian ports at ships' present asking rates for coal cargoes to this port.

NOTE—Con. Cal. and Va. has bullion valued at \$29,323, with further increase to arrive. Peerless bullion valued at \$8790.37. Navajo has \$12,300 due on pumping account.

THE Government of Ceylon has voted £800 for an exhibit at the Chicago Columbian Exhibition, and made application for 12,000 feet of space.

Assessment Notices.

SAN FRANCISCO MILLING AND MINING COMPANY.
Location of principal place of business, San Francisco, California. Location of works, West Point, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 12th day of January, 1892, an assessment, No. 1, of Two (2) Cents per share, was levied upon the issued Capital Stock of the Corporation, payable immediately in United States gold coin to the Secretary, at the office of the Company, Room 56 Nevada Block, 309 Montgomery Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 16th day of February, 1892, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 8th day of March, 1892, to pay the delinquent assessment together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS H. OSBORN, Secretary.

Office, Room 56 Nevada Block, 309 Montgomery Street, San Francisco, California.

GRAY EAGLE MINING COMPANY.—LOCATION OF principal place of business, San Francisco, California. Location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of January, 1892, an assessment, No. 2, of Six (6) Cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room 11, No. 303 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of February, 1892, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 7th day of March, 1892, to pay the delinquent assessment together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. BARROWS, Secretary.

Office, Room 11, No. 303 California Street, San Francisco, California.

KEYSTONE CONSOLIDATED MINING COMPANY.

Location of principal place of business, San Francisco, California. Location of work, Amador City, Amador Co., Cal. Notice is hereby given that at a meeting of the Board of Directors, held on Saturday, the 30th day of January, 1892, an assessment (No. 2) of Two Dollars and Fifty Cents (\$2.50) per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the Company, No. 310 Pine St., room 4, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of February, 1892, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 25th day of March, 1892, to pay the delinquent assessment together with costs of advertising and expenses of sale.

By order of the Board of Directors.

J. H. ISHAM, Secretary.

Office, No. 310 Pine St., Room 44, San Francisco, Cal.

CALIFORNIA VERDE ANTIQUE MARBLE COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2d day of February, 1892, an assessment (No. 2) of One (1) Cent per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin, to the Secretary, at the office of the Company, 308 Pine Street, San Francisco, California.

Any Stock upon which this assessment shall remain unpaid on the seventh (7th) day of March, 1892, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the twenty-eighth (28) day of March, 1892, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

W. J. OURNETT, Secretary.

Office, 308 Pine Street, San Francisco, California.

FOR A NOTARY PUBLIC go to Lee D. Craig, No. 316 Montgomery St., S. F.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents from backing on the sides and forming channels through the center. These slight rifles also serve very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will save a bl. per cent ge of sulphurets

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

Educational.

PACIFIC ENGINEERING SCHOOL,
121 Post St., San Francisco, Cal.

PRACTICAL, ELECTRICAL, HYDRAULIC, CIVIL, MECHANICAL, and MINING Engineering. Surveying, Architecture, Drawing, Assaying, and Navigation, GRAPHS, Drawing and Mathematics for the trades. Send for circulars Day and evening.

JOHN T. EVANS,
Assay Office and Chemical Laboratory.

ROOMS 46 AND 47 MONTGOMERY BLOCK, 628 R Montgomery Street, San Francisco. For nearly 15 years with Thomas Price, as Chief of the Ore-Assay and Analytical Department. Lessons given in Assaying and Chemistry.

FOR SEVENTY-FIVE DOLLARS THIS College instructs in Shorthand, Type Writing, Book-keeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business for six full months. We have sixteen teachers, and give individual instruction to all our pupils. Our school has its graduates in every part of the State.

E. P. HEALD, President.
C. S. HALEY, Secretary.

Advertisement for Proposals!

TUNNEL.

SEALED PROPOSALS WILL BE RECEIVED BY THE Directors of the Bear Valley Irrigation Company at Redlands, California, until March 1st, 1892, for the construction of a Tunnel about 6000 feet in length through rock, in accordance with the plans and specifications on file in the office of the undersigned. Bidders may propose to furnish their own plant, or to use a complete power, drilling, hauling and ventilating plant to be furnished by the Company. Each bid must be accompanied by a certified check for not less than 2% of the amount of the proposal. The Directors reserve the right to reject any or all proposals. EDWARD M. BOGGS, Engineer, Banning, California.

HORACE D. RANLETT,
Ores, Mining, and Commission,
420 Montgomery St., S. F.

Ships under advances to smelting works in Boeton New York, Baltimore and Liverpool.

Twenty-one years' experience in Shipping Ores and Managing Mines.

Solicits Consignments of Copper Produce and Management of Mining Matters.

All business conducted on Cash Basis.

ELECTRICAL ENGINEERING CO.,
— MANUFACTURER OF —
Dynamos and Electric Motors
FOR THE TRANSMISSION AND DISTRIBUTION OF POWER

Manufacturer of and Contractor for the Installation of all Kinds of
ELECTRIC APPARATUS.
The Dynamos and Motors manufactured by this Company develop the highest mechanical efficiency; they require little or no attention, are almost noiseless, and run with an entire absence of sparks at the brushes, rendering the daily trimming of brushes unnecessary.
Electric Power Apparatus for Quartz Mills, Hoisting, Pumping, Drilling, and all Mining Work, where Long Distance Transmission is desired, a Specialty.
Office and Works, 21 & 23 SPEAR ST., San Francisco, Cal., U. S. A.

DIAMOND ROCK DRILLS.
For prospecting Mineral Veins and Deposits, Boring Vertically, Horizontally, or at any angle to any desired depth, taking out a Cylindrical Section or Core the entire distance, showing exact character, and giving a perfect section of the strata penetrated. Also for Boring Artesian Wells perfectly straight, round and true.
Machines for Channeling, Gadding and other kinds of Quarry Work, Shaft Sinking, Tunneling, Mining, Railroad and all classes of rock-boring. Manufactured by
THE AMERICAN DIAMOND ROCK BORING CO.,
15 CORTLANDT STREET, NEW YORK.
P. O. Box 1442. Send for Catalogues and Price List.

WIRE ROPE
FOR ALL PURPOSES.
IRON AND STEEL WIRE OF ALL KINDS
TRENTON IRON CO.
NEW YORK OFFICE: COOPER HEWITT & CO. 17 BURLING SLIP
TRENTON, N. J. WIRE ROPE TRAMWAYS & C.

SHEET IRON PIPE
IRON PIPE
ALL SIZES, FOR GAS, STEAM AND WATER.
— WE MANUFACTURE —
SHEET IRON AND STEEL PIPE,
ALL SIZES,
For Water Supply, Mining, Irrigating Purposes, Stock Ranches, Etc.
Made in Lengths Desired from 16 to 30 feet.
The Cut shows a Section of Three Joints
DOUBLE RIVETED SHEET IRON PIPE.
In the manufacture of this Pipe, we use only a high grade of annealed Charcoal Iron of great tensile strength.
The weight or thickness of metal used, is graded according to service required, and pressure to which the Pipe will be subjected.
FOR ALL UNDERGROUND PURPOSES, we immerse the Pipe in a bath containing a special mixture of ASPHALTUM, BITOH and PETROLEUM, at a Temperature of 300° Fahrenheit. It thus receives a thorough coating, both inside and outside, rendering it impervious to the alkalies of the earth, rust, etc., and is practically indestructible.
CORRUGATED
CORRUGATED IRON,
Black, Painted and Galvanized, for Roof and Sides of
HAY BARNs, DRY HOUSES, STABLES, ETC.

F. A. HUNTINGTON.

PATENT ORE FEEDER. CENTRIFUGAL ROLLER QUARTZ MILL.

This Feeder is especially designed to feed the Huntington Roller Quartz Mill; it is simple in construction, and while in motion can be easily adjusted to feed fast or slow; it has but few wearing parts and its positive movement makes it the best Ore Feeder now in use.

The Following will Explain the Above Cut:

The ore and water being fed into the mill at the hopper A, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

F. A. HUNTINGTON,

MANUFACTURER AND DEALER IN

STEAM ENGINES AND MINING MACHINERY OF EVERY DESCRIPTION.

OFFICE AND WORKS, 213 TO 219 FIRST STREET, SAN FRANCISCO, CAL.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 2000 IN ACTUAL USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

THE PELTON WATER WHEEL CO.

121-123 MAIN STREET, SAN FRANCISCO, CAL., U. S. A.
143 LIBERTY STREET, NEW YORK, U. S. A.

PELTON WATER MOTORS, Varying from the fraction of 1 up to 40 and 50-horse power, unequalled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. Address as above.

THE GATES ORE AND ROCK BREAKER.

UNLIMITED IN CAPACITY. UNEQUALLED IN EFFICIENCY, UPWARD OF 3,000 NOW IN USE. Will do more than twice the work of any other with the same cost in wear. Gives a fineness of product that increases the capacity of any mill from 25 to 40 per cent without any additional expense. THE BEST AND ONLY CRUSHER ADAPTED TO MACADAM ROAD WORK. Send for Circular.

It having come to the notice of the undersigned that their patent rights are being infringed upon, intending purchasers are hereby warned that all such infringements will be duly prosecuted. (Signed) THE PELTON WATER WHEEL CO.

Dewey & Co.'s Scientific Press Patent Agency

ESTABLISHED 1860

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enable us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 230 Market St., S. F.

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

Manufactured under Patents of April 27, 1880;

September 18, 1883; July 24, 1888;

and March 31, 1891.

Ice-Making Machinery.

A branch of mechanical science which demands a high degree of skill is that of mechanical refrigeration and the manufacture of pure ice. It was long since discovered that certain gases, such as ammonia and carbonic acid, could be changed from a gaseous to a liquid, and even solid state, under certain conditions of pressure and temperature. It was further found, that if the pressure which maintained the gases in a liquid state were removed, the substances would return to their gaseous state, generating by the change a very intense cold. It was also observed that certain substances could, in some manner not very well understood, absorb a very large quantity of ammonia gas. Upon the scientific knowledge of these two principles, the whole of our present system of mechanical refrigeration is based.

The principles are practically the same in all the different refrigerating machines, merely modified by each manufacturer to suit his own ideas. In the compression system the three stages of operation are as follows: 1, compression of the gas; 2, condensation of the gas and a withdrawal of the

heat caused by compression; 3, expansion of the gas and absorption by it of the heat from the surrounding objects. The absorption system differs only in slight particulars

and the direct expansion system. In the brine system the evaporating coils are submerged in tanks filled with strong brine made with common salt. The ammonia absorbs the

heat from the brine and reduces it to any temperature named. For refrigeration the brine is pumped through a system of coils which are placed in the rooms to be cooled, and the brine absorbing the heat returns to

the tank to be again cooled, and so on continuously. In the direct expansion system the ammonia evaporating coils are themselves placed in the rooms to be refrigerated, and the ammonia thus absorbing the heat by direct application in the expansion coils gives the name to the system.

The utilization of refrigerating processes for commercial purposes has developed wonderfully of late years, and especially as applied to railway and steamship transportation. The processes are used also extensively in brewing, distilleries, meat preservation, fruit-shipping, cold storage, etc., etc. Among the most improved ice-making and refrigerating machinery is that of "The Hercules," for which the Parke & Lacy Co. of this city are agents, on the Pacific Coast. This machinery is used for ordinary refrigerating purposes and the manufacture of ice also.

For the latter purpose, the system of distillation and complete filtration carried out by the Hercules machines is excellent. By the process adopted, they use all the exhaust steam of the engine, thus utilizing what would otherwise be a waste. The needed power

(Concluded on page 140.)

THE HERCULES MODEL ICE PLANT.

from the foregoing. The vacuum system is different, but it is used for ice-making only.

To utilize the cold from either of the two plans for producing artificial cold, two methods are employed—the brine system,

heat from the brine and reduces it to any temperature named. For refrigeration the brine is pumped through a system of coils which are placed in the rooms to be cooled, and the brine absorbing the heat returns to

machines is excellent. By the process adopted, they use all the exhaust steam of the engine, thus utilizing what would otherwise be a waste. The needed power

STEAMSHIP REFRIGERATION.

HERCULES ICE MACHINE FOR STEAMSHIP REFRIGERATION.

Systematic Mineralogy.

This is the title of a volume by T. Sterry Hunt, issued by the Scientific Publishing Co. of New York. It is really a notable work of the greatest interest to the student of mineralogy. Some idea of its scope may be gained by giving the headings of certain of the chapters, as follows: The relations of mineralogy, mineralogical systems, first principles in chemistry, chemical elements and notation, specific gravity, coefficient of mineral condensation, theory of solution, relations of condensation to hardness and insolubility, crystallization, constitution of mineral species, a new mineralogical classification, mineralogical nomenclature, synopsis of mineral species, mineral history of waters, mineral names. The aim of the writer in the mineralogical system proposed has been to observe a strict conformity to chemical principles, and at the same time to retain all that is valuable in the natural-history method, the two opposing schools being reconciled by showing, that when rightly understood, chemical and physical characters are really dependent on each other, and present two aspects of the same problem, which can never be solved but by the consideration of both. Hence it is thought proper in the introductory chapters of this volume to explain in a somewhat elementary manner, such principles of physics and chemistry as seem necessary for a clear understanding of this relation.

The question of scientific nomenclature on mineralogy is one of much importance. The barbarisms of the trivial names now universally employed are only too evident, while the endeavors to replace them by something better have been many. How far the author has succeeded in his effort to construct a new nomenclature must be left to his colleagues to decide. While following, so far as appeared practicable, that of Breithaupt, he has been led to devise one which is, in a great part, novel. Whether his groupings of species into genera will satisfy mineralogists remains to be seen. He can, however, claim the merit of having followed a definite plan, and created a binomial Latin nomenclature which is consistent and logical. Following the discussion of this question, in Chapter XII will be found a "synopsis of mineral species," which gives a connected view of the nomenclature adopted, with the scientific and trivial names of the species recognized in the present treatise.

In the next three chapters are concluded the orders, genera and species which make up the first three classes in the present system, the species of each genus being tabulated, with their scientific and trivial names, while opposite them, in separate columns, are given for each species the calculated value of the chemical unit, the specific gravity, and the reciprocal of the coefficient of condensation. The hardness of each species on the scale of Mohs, and an indication of its geometric form, in the case of crystalline species, are inserted in the table.

In describing the several orders, genera and species, there is given an explanation of the nomenclature here adopted, together with a discussion of their more important historical and chemical relations. In class IV, where the species are for the most part undefined, the author has introduced certain details with regard to the more important bodies, graphite, diamond, petroleum and coals, upon which more precise information than is to be found in other mineralogical treatises was much to be desired. In the final chapter, various questions connected with natural waters in their mineral relations have been discussed, with many new facts and considerations, which throw light upon several important problems in mineralogy and geology. The price of this book is \$5.

A MONSTER WAGON.—What is without doubt the heaviest wagon ever made, was built lately by the Miller-Knoblock Wagon

Co., of South Bend, Ind., and was consigned to the Cleveland City Cable Ry. Co., of Cleveland. Its weight is 9000 lbs., and its guaranteed carrying capacity 100,000 lbs. or 50 tons. It is intended for use in transporting cable reels or spools, containing long lengths of street car cable, from the depot to the power house.

In the Line of Friendly Policy.

The current issue of the MINING AND SCIENTIFIC PRESS comes to hand full of good things for mining men. In its columns we find an article in defense of George Ohleyer, who has long been regarded as a personal enemy by many mining men. The PRESS declares that Mr. Ohleyer is fairer minded than he has been given credit for, but admits that he is a man of strong prejudices. This seems to us inconsistent, but if Mr. Ohleyer will only let up on us and be real nice, we'll call him a gentleman, a scholar and a good judge of whisky.—Nevada City Herald, February 9th.

The article referred to in the above paragraph was not intended as any defense of Mr. George Ohleyer, nor was there any inconsistency in our remarks about his being perhaps fairer minded than he had been given credit for, and at the same time stating that he was a man of strong prejudices. The reason of his apparent fairmindedness was given—favoring a hydraulic mining resolution introduced at the committee meeting of the River Improvement Convention by John B. Hobson.

We wrote the article in question in a spirit of fairness toward a leader of the men who had always been opposed to mining, but who have now joined hands with us in a common cause. It was represented in the newspapers that Mr. Ohleyer had gone off ahead of time as an agent of the Anti-Debris Association to Washington, and would injure the miners' cause if he could. He did not go as an agent of the Anti-Debris Association, but as a delegate of the River Improvement Convention. He did not go secretly or ahead of the time set for him, but went as he was told to and at the time appointed, and we thought it proper, as far as we were able, to correct the popular error, so that the miners would understand the situation as it actually existed.

The MINING AND SCIENTIFIC PRESS does not believe in misrepresenting anybody, friend or enemy. While the writer does not profess to be an admirer of Mr. George Ohleyer, or his previous course toward the miners, it must be remembered that Mr. Ohleyer was a paid employee of the Anti-Debris Association, or so understood to be, and naturally had to earn his salary. Under these circumstances, it is hardly probable that he cares especially to see any movement which might take that association out of business. At the same time, when he went to Washington he did so for another body, the River Improvement Convention, which has officially entered into an amicable agreement with the representatives of the State Miners' Convention, and we are assured that Mr. Ohleyer will be governed by the policy of the body which sent him. Whether he personally likes this policy is another question; but he is sure to be bound by it, and, in fact, was promptly informed that he must be.

While Mr. Ohleyer has long been considered as a personal enemy by mining men, as the *Herald* states, it may be remarked that the same is true of many other men, who are now, through the result of the State Mining Convention, acting in a friendly spirit and lending their assistance to the miners' cause. We want to see this amicable understanding perpetuated. There has been enough conflict and misrepresentation. Our article on Mr. Ohleyer was not intended as a defense of him personally, but was simply in the line of the friendly policy adopted by miners and farmers, to which we agree with all heartiness. It was not right to let the impression prevail that the Anti-Debris Association, the River Improvement Convention, or Mr. Ohleyer, were trying to take unfair advantage of the miners, when such was not the case.

Patent Tricks—Old and New.

Some time ago, under this heading, we briefly explained some of the methods practiced by sharpers upon unsuspecting patentees, for whose benefit we will now repeat our remarks and make a few additions.

When an inventor receives a patent, his name is immortalized in the *Official Gazette*, and he immediately becomes the object of attack from a horde of hungry aspirants for money, among whom are ex-clerks, patent brokers, and pretended legal lights of varying degrees. The patentee is deluged with circulars and letters from this class of gentry. Some write to inform him confidentially that his patent is good for nothing; but on receipt of a certain fee they will set it right and make it sound as a silver dollar. Others pleasantly inform the new-fledged inventor they have read his patent with great pleasure; consider it to be a very valuable invention; if properly introduced, much money can be soon realized. The State of Iowa, they say, is worth \$50,000, Ohio, \$45,000, Pennsylvania \$65,000, and so on. All that is necessary is to print some circulars and do a little blowing, which the broker generously offers to do on receipt from the inventor of ten to fifty dollars cash in advance. Another writes to say he has an actual offer of \$10,000 for the patent in Canada, provided the patent is at once taken, which he will procure on receipt of the necessary money. It is almost needless to suggest these schemes are designed to fleece the inventor. The so-called patent sellers rarely effect a *bona fide* sale. They depend upon the advance fees obtained as above for a livelihood. Some of them have thus grown rich and prosperous.

These pretended sellers try to make it appear they are reliable by giving respectable references, and cite names of patentees for whom they purport to have sold patents. One mode of procuring these references is as follows: They write the patentee they have a customer who will buy a county right in Minnesota for \$500, and pay by deeding 25 acres of land in Arkansas, really worth \$1000, but the parties are so anxious to obtain the patent right they are willing to let the land go, and take the right in settlement, provided \$50 cash is paid and a mortgage is given for \$500. This done, the patent broker closes the transaction, receives the \$50 cash, which is the full value of the land, also receives a mortgage for \$500, together with a patent deed. At the same time the broker is careful to obtain a written certificate from the inventor stating, "I take pleasure in saying that X. Y. Z. & Co. have sold a patent right for me, at my price and on terms satisfactory, and I recommend them, etc. In this way references are secured which make quite an impressive show on circulars, while the inventor is so ashamed of having been so easily duped, he keeps mum.

One of the latest tricks is the following: The patentee receives a letter from A. & B. asking for how much he will sell his patent for such and such a State. He replies, giving a price, say \$5000. The patentee soon after receives another letter from X. Y. Z., saying that A. & B. write they have corresponded with you, and now say they have decided to purchase the patent on the terms named, provided the title and claims are found to be correct. To ascertain this, they require that X. Y. Z. shall examine and report upon the patent, otherwise A. & B. will not purchase; that if the patentee wishes to complete the sale he must remit \$50 to pay for the examination, which is a work independent of the sale, and must be independently paid. The inventor sends the money; a report is made adverse to the patentee, no purchase is made, none was ever intended.

A new edition of the same class of swindles is worked by a gang of confederates as follows:

One of the swindlers writes to the patentee asking if the patent has been disposed of. If not, he would like to correspond with a view to purchase or manufacture. Reply is made that the patent is for sale. Then comes another letter from the swindler, saying substantially, "We have examined the invention very carefully, and if you will furnish us with an opinion or report as to the scope or validity of your patent we will, if same is satisfactory, make you an offer either for purchase or license on royalty. Our proposition will be based entirely on the nature of the opinion or report. If you have not already a reliable opinion, we recommend D. & Co. (Diddlem), as moderate in charges for this class of work. Such patent rights as we buy must be bought at once, and it will therefore pay you to furnish the report without delay." The inventor then writes to the other members of the gang, Diddlem & Co., by whom the inventor is requested to send \$50 or \$100 cash and the desired report will be furnished.

Unsuspecting inventors easily fall victims to this trick; the money is paid, and the tricksters, who never had any idea of buying the patent, divide the plunder.

The patent insurance dodge is another scheme for relieving inventors of their cash. This purports to be a corporation for insuring inventors against infringements. By paying \$8 cash within 30 days of the issuance of the patent, the concern undertakes to insure the patentee for one year against any infringement of his patent by other people, besides giving advice and services for which other lawyers charge anywhere from \$250 to \$10,000. There is less chance of infringement during this period than that the inventor will be struck by lightning in winter. This is simply a scheme to do the inventor out of \$8.

A French trick played with much success on American inventors is the following: The new patentee receives by mail, from Paris, a flaming ornamental document of provisional membership, which looks as if it came officially from the president of the famous Academy of Sciences, with a letter informing Monsieur le John Smith of Snuffkinsville, Arkansas, Republique des Etats Unis, that the Academy has observed with pleasure his invention for planting seeds, so important for agriculture; in view of which they have voted to confer upon M. le Smith the honorable distinction of membership in the Academy. M. le Smith will have the goodness to remit to the treasurer the nominal sum of 50 francs—ten dollars—to defray the cost of the parchment, framing, boxing and transportation of the diploma. These tricksters are said to draw considerable money from the United States.

Such are a few of the adroit schemes now in vogue for swindling "innocent" inventors.

Bills have been introduced in Congress to protect innocent purchasers of patents, i. e., infringers. Might it not also be well for somebody to formulate a law to protect innocent inventors?—Scientific American.

Minerals and Townsites.

It was an interesting case that Secretary Noble decided, involving the town of Iowa Hill, Placer county, Cal. It was the case of B. F. Myers vs. John B. Hobson et al., involving a mineral application for land in Sacramento district. The Commissioner's decision in holding Hobson's mineral application for cancellation is reversed by Secretary Noble. He says Hobson et al. should be allowed to make entry for the tract. Hobson, in 1887, made a mineral application for the Excelsior placer mine. It had once been embraced in the Central Pacific Co.'s selections, but was cancelled on account of the existence of minerals, in June, 1887. B. F. Myers, Superior Judge of Placer county, as ex-officio trustee for the inhabitants of Iowa Hill, filed an application for patent to the fractional northwest quarter of said section 33, alleging that the land was more valuable for agricultural purposes and for the purposes of residence, trade and business than for mining purposes. After a hearing the Register and Receiver found that the land in question possessed but little or no value for agricultural or for municipal or residence purposes, or as a townsite, but that it possessed positive and high value for mineral purposes. The Commissioner reversed this decision and an appeal was taken to the department.

The Secretary says the town of Iowa Hill has been in existence since 1854, and soon after mining operations began in Placer county. The town once had more than 1000 inhabitants, but at the time of the trial only about 150, of which only 30 resided on the tract in question. The majority and the better class of citizens lived on land adjoining this tract, and knew nothing of this townsite application, and were opposed to it. The land had a positive value for its minerals. Thousands of dollars have already been taken from this ground. Some of the townsites witnesses testified that the tract is not valuable for mining purposes, but their opinions are mainly based upon results obtained in former years. The failure to obtain good returns from hydraulic works 30 years ago is no criterion of present value of mineral land, with the present improved machinery. Cheapened supplies have increased the knowledge of mining, etc.

CHEMISTRY OF A TEAR.—The chief element in the composition of a tear is water, but with water is associated minute proportions of salt, soda, phosphate of lime, phosphate of soda and mucus, and when seen under a microscope, a tear after evaporation looks like a very small fish bone, owing to the salines forming themselves into lengthened crosslines.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Ed.

Cortez District.

Occurrence and Distribution of Ore Bodies in Nevada.

SAN FRANCISCO, Feb. 15, 1892.

TO THE EDITOR:—In the last annual mining review of the *Chronicle* occurs a statement calculated to arrest the attention of both the prospector and the geologist, this statement being to the effect that the ore deposits of Nevada are found not only scattered quite evenly over the entire area of the State, but that such of them as have partaken of the character of bonanzas are located near its center or midway its borders on either hand and in the directions of the cardinal points of the compass.

In support of this statement, the writer calls attention to the fact that the Comstock mines are situated on the western verge near the middle of the State, being confronted by the Pioche district, lying directly to the east and close to the Utah line, while midway on the north we have the Tuscarora mines, opposed by the Candelaria group lying opposite and far to the south, the Austin and the Cortez mines being near the center of the State.

But besides the singular position of these bonanza deposits, we are reminded that the metalliferous veins of Nevada have a wide and equable distribution, there being not a county in the State but contains many valuable deposits of this kind, this being more than can be affirmed of any other State lying west of or adjacent to the Rocky mountains.

Of these more notable and largely productive mines nearly all have had a remarkable history, none more so than the Cortez group, situated in Lander county. In the fall of 1863 a company of prospectors, of which the writer was one, set out from Austin to explore the country to the north. Traveling in that direction about 60 miles, they came into a region abounding with silver-bearing lodes. Here they camped and proceeded to organize a mining district, which they named Cortez. This done, a great number of claims were taken up and recorded; also, a goodly area of the scrub pine forests and several small springs found in the neighborhood. After tarrying in the district for a short time, the party returned to Austin and there separated, each man going his own way, it being deemed too late in the season to undertake any improvements in that remote and forbidding section of country.

Of this pioneer party not more perhaps than three or four ever returned to Cortez. Of the few who went back was Simeon Wenban, he being the only one who kept up his assessment work and permanently remained. Although his means were limited and he never received much outside assistance, Wenban managed not only to stay but succeeded, after a struggle extending over a number of years, in partially opening some of his claims and getting a small mill on the ground.

With the earnings of this mill, never large, he contrived to defray current expenses and also keep work going on a tunnel designed to more thoroughly prospect his ground. This tunnel proved at last such a strain on his slender finances that he was compelled to suspend work upon it. Putting in a last shot before doing so, a body of ore was broken into which afterward proved to be of high grade and great extent. This good luck came to our miner only after many years of deprivation, hardship and toil.

The newspaper accounts of this event have not always been correct, some of them representing Wenban to have been at the time abjectly poor and so discouraged that he was about to give up and abandon the field altogether. Though reduced to dire straits and burdened with debt, he never, however, entertained a thought of giving up the contest.

But these writers for the press were not to be blamed, Wenban being a man little disposed to talk about his private affairs. He hates notoriety, and, though communicative enough on other subjects, will not be interviewed concerning matters purely personal; wherefore, our scribes, in the absence of more exact information, were left to guess a good deal. Moreover, the paragrapher of the present day must cater to the popular taste. He must deal in striking antitheses and flavor his articles with a spice of romance—jerk the pauper from the poorhouse into a palace, converting him from a beggar into a millionaire in a single day. For this reason, these writers are to be excused when they

represent that one last shot as having lifted our hardy miner out of the slough of absolute destitution up on the delectable heights of enormous wealth, although he was at the time in comparatively easy circumstances and already in the way of achieving at least a moderate success.

The property now owned by Wenban in the Cortez district is valued at about \$7,000,000, these mines having produced to date a total of about \$6,000,000, net profits \$3,000,000. The output at present and which can probably be kept up for an indefinite period, is \$50,000 per month, made at a cost of \$18,000.

Time and again have we, who accompanied Wenban on his first trip to Cortez, been reminded of the fatal mistake we made in not returning and, like him, accumulating a fortune there. A terrible mistake it would have been to be sure, had we, who never went back, been constituted like him who did so, and accomplished so much. But here was the trouble, we were not so constituted; we had not the nerve, the will power, nor yet the power of physical endurance given to him. Wherefore, it was well that we never went back. Some of us have since succeeded tolerably well along other lines of endeavor, as well perhaps as our early confrere would have done had he worked in the same direction. In advising to any course of action, fitness and qualifications should be duly considered, otherwise what is intended to serve as a useful example may be perverted into a baleful illusion. Simeon Wenban, besides the possession of an iron constitution, is a man of great determination. His purpose once fixed is not easily altered. General Grant resolved to fight it out on his chosen line if it took all summer. Wenban did the same thing, knowing it would take a good many summers. H. D.

Petroleum in San Luis Obispo.

The Paso Robles *Moon* says:

One of the most important discoveries in the history of this county was made not long ago when oil was discovered this side of Cambria, on the Santa Rosa creek. The deposit promises well. The soil is very pregnant with petroleum which oozes out constantly. In some places the fluid may be seen in almost running streams. Indications point to an inexhaustible supply. A stock company was formed at once to develop the oil. The capital stock was placed at \$500,000, and was all taken in a short time. A. F. Benton, manager of the Eagle Ranch, of which Baron Von Schroeder is owner, is at the head of the vast enterprise. Nearly 8000 acres of land, on which the fluid is located, was leased for a term of 20 years, thus giving the projectors ample opportunity to develop the new industry.

Mr. Massey, one of the stockholders and superintendent, is now getting things in readiness preparatory to commence boring for oil. Some of the machinery is now on the ground. Development will commence as soon as the incorporation papers are filed, which will be in a few days.

This discovery will serve to show the many resources of San Luis Obispo county. In this connection, it is well to say that Myron Angel, while at the Miners' Convention last week, had the pleasure of explaining that San Luis Obispo county was richly stored with minerals; that we also mined gold in the La Panza; that we had mountains of bituminous rock, which makes the best pavement in the world; that our chief mountain range holds vast deposits of chrome which we send to Philadelphia and Baltimore chemical works; that we produce the most beautiful onyx ever seen; that we have oil, asphaltum, gypsum, alabaster, salt, sulphur, antimony, manganese, iron, copper, limestone and other minerals of value, and that we have many rich deposits of quicksilver which we will work when the hydraulic miners and other miners of the precious metals resume operations and give mining of all classes a standing and prosperity. But this new oil discovery promises to beat them all.

HOW IT EXPLODED.—An old prospector in this district, who does not want his name mentioned, has been in the habit of putting his powder in hot water to thaw. The other day he put some powder in a can of water and placed the whole thing on the forge fire. The same water had been used for the same purpose several times before, and had, naturally, absorbed considerable nitro-glycerine. When the water became heated, it exploded, blew the forge to the unknown, and tore the clothes clean off the corporeal form of the astonished prospector. He will never thaw powder in that way again, for he has learned that nitro-glycerine will not amalgamate with water and stand fooling with.—*Eureka Sentinel*.

Edison's Inventions.

Money from Manufacturing Rather Than from Patents.

Mr. Edison wrote down a list of his inventions, which, as he said, were his commercial inventions—that is to say, those which, by returning a profit, had proved their own success, says the *New York World*. This is the list, with his comments:

District Telegraph—Of that I am one-half inventor.

Quadruplex System of Telegraphy—That is my invention.

Stock Ticker—Of that I am one-half inventor.

Telephone—One-half my invention.

Electric Pen and Mimeograph—My invention.

Incandescent Lighting System—My invention.

Electric Railroad—I am one of the inventors of that.

Phonograph—My invention.

The district messenger service is in use in 600 cities and towns in the United States. The investment amounts to about \$4,800,000, paying about 5 per cent. The system employs about 30,000 persons, averaging \$1 a day salary.

The quadruplex system of telegraphy is in use on 72,000 miles of Western Union wire. Eleven years ago the Western Union reports stated that the quadruplex system saved \$560,000 in interest and repairs. Inasmuch as every mile of wire actually built does the work of four miles of wire, the quadruplex system represents 216,000 miles of phantom wire, worth \$10,800,000.

On these \$10,800,000 worth of wires there is no repairing to be done. The value of those phantom wires is therefore represented by a saving of \$860,000 in repairs at \$4 a mile annually, besides the interest on the \$10,800,000 which it would have taken to build them. Three thousand men work on my duplex instruments. I sold the system to the Western Union 16 years ago for \$30,000, and spent the whole of it in experimenting in trying to make a wire carry six messages instead of four. I didn't succeed, so that financially I am worse off than I would have been had I never invented the quadruplex system. The stock ticker employs about 500 men at work, and represents an investment of \$8,000,000, paying about 5 per cent a year. From that invention I have received at different times \$50,000. I spent \$60,000 in getting the thing up. That again was a loss.

Bell invented the receiver. That is the end of the telephone which you put to your ear. He was trying to use that simultaneously as a transmitter, but could not make it go. The thing, therefore, did not pay. I invented the carbon transmitter, which made the telephone a financial success by making it commercially available. Here are the financial figures on the telephone, which really stagger me, now that I come to look them up. Throughout the world there are at least one million telephones in use. They pay \$50,000,000 a year rental. They represent an actual investment of \$100,000,000 at least, capitalized at twice that sum and paying about \$10,000,000 a year profit. That invention of mine was a very good thing for the girls, which is a gratifying thought. It employs 20,000 people, mostly young women. I got for the telephone about \$102,000 in all. Taking out what I expended in experiments, I probably realized \$25,000 in clear profit. Bell made about half a million. Many people imagine that he made an enormous fortune, but he didn't. It was his father-in-law who made a vast fortune by getting control of much stock.

My electric pen and mimeograph duplicating apparatus is used very largely here and in Europe. Three hundred men make a living out of it. The profits on that are not large.

My incandescent light system is the most satisfactory to contemplate as regards the employment it gives to great numbers of men. Throughout the world, 36,000 men make a living out of that invention. In my shops at Schenectady, I employ 3800 hands; at my Harrison Lamp Works, 1000; in the New York Works, 150. About 4,000,000 lights are burning. These represent an investment in cold cash of \$100,000,000. I can count up \$87,000,000. In addition to that, customers have paid \$12,000,000 more for the installation of wires. The thing is capitalized, taking all the companies together, at about \$200,000,000, paying from 4 to 20 per cent a year. My patents on incandescent lights netted me about \$140,000. I spent about \$400,000 in experimenting.

The electric railway is, of course, not such a big enterprise. I built the first in the

United States at Menlo Park in 1879. It was three miles long, and on it I obtained a speed of 40 miles an hour. I sold it out long ago. I did not get my money back on it.

The phonograph is a new thing. It will take four or five years to pioneer it. It will be greater than the telephone. To pioneer a thing is to get it on its feet. It took 12 years to pioneer the type writer. Yes, I might invent an electric type writer, a noiseless one, but the thing is not pressing, as it is in very good condition now. I have sold the phonograph out, but about that there is a complicated story, which need not be told. I have made no money out of it, but there is one thing which I am now working on out of which I shall make money, and of which nobody can get any share except the boys here who own the thing with me. That is the magnetic concentration of iron ores. It is the latest commercial thing I have got up.

I have a mill at Ogden, N. J., with a capacity of 2000 tons in 20 hours. This is the idea briefly. Iron ore is not Bessemer ore unless it contains as little as a fifty-thousandth part of one per cent of phosphorus. If it has more phosphorus than that, it is brittle and cannot be used for making Bessemer steel. We are obliged, for our Eastern manufacturing interests, to import Bessemer ore from Algiers, Cuba, Spain, etc., as the freight from Michigan is too expensive. We import about 1,600,000 tons per year. New Jersey contains the largest strip or area of primal rock containing ore in the United States. There is probably more ore in this State in the primal rock than in all the rest of the States put together. The magnetic concentration of that ore will produce enough to supply the United States for centuries.

The process of concentration—that is, of extracting magnetically the small particles of ore from the rock in which it is scattered—makes it Bessemer ore of the highest quality by destroying the phosphorus in it. I have been for three years leasing all the available deposits of ore in New Jersey. I have secured 18 square miles of mineralized rock now. This will be for me a regular Standard Oil enterprise. In six or eight years I shall take out \$10,000,000 or \$12,000,000 worth of ore a year at a profit of about \$3,000,000 a year clear. I have now in contemplation eight mills.

From my various patents, so far as the patents themselves go, I have stood an actual loss in experimenting and in lawsuits of \$600,000. I should be better off if I had not taken out any patents. I do not mean to say that I am a pauper, as you might think from my talk, but my money has not been made out of patents or out of any protection that the Patent Office has given me. I have made it all in manufacturing, and I have made quite enough to pay for my experiments and to get a good living, which is all that I care about.

I have worked on as many as 40 machines at one time. An exhibition of all the machines that I have worked at and experimented on, if I had kept them, would cover about 25 acres.

LIDGERWOOD HOIST—A neat reminder of the Lidgerwood Manufacturing Company comes to our desk in the shape of a delicately tinted bevelled edge card, 7 x 8 3-4 inches, upon which is mounted a photograph of a new six spool Lidgerwood hoisting engine for bridge erectors. There is a brief description of the engine below the photograph. The card is designed to be hung upon a nail. The Lidgerwood six spool hoisting engine is portable, serviceable and thoroughly reliable, and is designed for use in bridge erection and in the construction of iron buildings. It can also be profitably used for hoisting heavy loads generally. It has six spools independent in action and each having a clutch, lever, ratchet and pawl. The absolute independence of the spools enables the engine to be operated to great advantage in bridge erection as several members of a truss or girder can be hoisted and held in position while they are being riveted. The engine has many other attractive features and the Lidgerwood Manufacturing Company will gladly reply to all inquiries concerning it, addressed to the New York office of the company, 96 Liberty street.

A NEW ELECTRIC ROCK DRILL.—The Electrical Engineering Company of 21 and 23 Spear street, in this city, have on exhibition their new electric rock drill. This drill, in its general construction, is quite similar to other drills of the kind, but has a number of improvements which are thought to render it superior to others. Mining men who are especially interested in such matters will do well to call and examine it. It will be found in operation from 10 A. M. to 4 P. M.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Cor. Amador Ledger, Feb. 13: The mining prospects here continue to look more encouraging as the work of development proceeds. Good progress is being made in drifting south at the Wildman at the lowest level. The drift is run alongside of the ledge, and is being extended at the rate of about 12 feet per week, and the necessary distance from the shaft for crosscutting operations is almost reached. The ground passed through consists of boulders with a coating of lively looking gongee, which is regarded as an excellent indication. The Hector mine presents a more animated appearance than all the other mines combined, owing to the fact that the work is carried on exclusively on the surface. Powder is being used in abundance, and the constant blasting resembles a continuous cannonade of a Fourth of July celebration. At the Belmont, the 10-stamp mill is being run only during day time, and is supplied with ore from the main tunnel. In about 50 feet more, connection will be made with the boss shaft, and the mill will then be kept running day and night. At the Lincoln, matters have assumed something of a circus-like turn the past week. It appears that the mill has not panned out to the satisfaction of the parties interested. It is intimated that the stamps have been pounding away on stuff that failed to respond with scarcely more than the color of gold; although Mr. Smith, one of the best millmen in the county, was in charge of the mill. He was politely asked to step aside by the miners and one or two others financially interested, and so a general change in the milling program has taken place. Sinking at the South Eureka progresses in a satisfactory manner. Quartz has been met with from the commencement. The formation is considered favorable, and confidence is felt that in crosscutting, a good mine will be opened.

CLINTON CONSOLIDATED.—Ledger, Feb. 13: We are pleased to be able to state that the outlook for this property is very encouraging. They have sunk to a depth of over 300 feet, and twice during the past week have encountered exceedingly rich ore—the rock being studded with gold. We have not seen these rich specimens, but are informed that a small candle box of quartz was estimated to contain at least \$50 in gold. The rich vein is said to be five feet wide. The chlorination works are again running. D. Guttman, the superintendent, went below last week, to purchase a stock of goods for the company's store, which is expected to commence business in a short time. A petition is before the supervisors for the creation of a new school district at this place, so that, altogether, the prospects of the little town of Wieland are decidedly encouraging.

AMADOR QUEEN.—Operations have come to a standstill at this claim. Dr. Barde, who is chiefly interested, came up a few days ago, and wisely decided to put an end to the wild efforts at mining which have characterized the operations here for several months.

BAY STATE.—Sinking is progressing again, after a stoppage of two weeks, employed in cutting a tunnel and placing a pump in the shaft to drain off the surface water caused by the rains. The shaft is down 220 feet, and as the ground has become more favorable, better progress will be made, and it is expected to be crosscutting the ledge in three months. The financial status, under the economical management of Mr. Jones, is all that can be desired, there being funds enough in the treasury to more than pay off all indebtedness to the present time.

MORE STAMPS.—Twenty more stamps are to be added to the mill at Quartz Mountain in the spring. This will make 40 stamps in all. This steady increase of milling capacity is conclusive evidence that mining at this point has got down to a solid and prosperous basis. Other claims will doubtless be started up on the old mountain ere long. There is rock enough to keep several hundred stamps in steady motion for a lifetime.

Fresno.

GOLD ORE.—Fresno Enterprise, Feb. 15: Two mines, the Starlight and Riverside, are owned by Charles Ward and other persons. They are situated about one-half mile east of Grub Gulch, east of Madera, says the Mercury. The mines are rich in gold ore. The Starlight is down 120 feet, and men are working on the Riverside on a line between the two. The mines lie side by side and embrace a territory of 3000 feet. They were located by Mr. Ward two years ago, but active work was not begun until last spring. The surface ore pays from five to six dollars per ton. At the depth of 80 feet in the Starlight, rich sulphurets increase and more gold is encountered. In the next 60 feet the ore assays at \$15 per ton, and every foot farther the shaft is sunk the ore becomes more valuable. Aside from this splendid showing, quite a number of other mines in the immediate vicinity are constantly growing in favor, and in a recent strike made in a recent location, sulphurets were found that assayed as high as \$493. It is also reported on credible authority that miners have, for the past week or two, ground out as much as \$8 from rock per pound by means of an arrastre. The excitement has been suppressed on account of the rich find, and persons posted assert positively that there can be no doubt as to the discovery of the mother lode. Close to the Starlight and Riverside mines are the Josephine, Gambetta, Enterprise, Belmont, Pool, Swan and King's Gulch, the last named being the property of Thomas B. Cargile and others, of Madera. This mine is showing up splendidly and indications point to the owners having a fortune. About a year

ago, a Mr. Swain, a capitalist of San Francisco began tunneling into one of the veins leading into the mother lode. Working part of the time night and day, he has reached an exceedingly rich vein of ore four feet wide, 275 feet from where the tunnel commenced. He will shortly put up a large mill.

Nevada.

OMAHA MINE.—Grass Valley Telegraph, Feb. 12: Just at present the Omaha mine seems to have put on its spring attire and is about to declare another dividend. The dividends heretofore have been 15 cents per share, and while we speak without authority, it is safe to say that the coming dividend will come up to that standard, if not more. The dividend, if declared, will be payable on the 26th of this month.

HARTERY MINE.—Wednesday night the miners unearthed a good ledge on the Roach (Hartery Company) ground. The ledge as found is about ten inches in thickness, shows gold in every part of it, and every member of the company now feels in good cheer over the new find.

VERY RICH ORE.—Grass Valley Telegraph, Feb. 10: At noon to-day (Wednesday) Superintendent Mainhart of the Omaha mine brought to town some very rich ore just taken from the very bottom of the mine. The ore is full of the very best gold-bearing mineral, and shows free gold all through it. It may be seen at the Citizens' Bank.

PROSPECTING AN OLD LEDGE.—Years ago, in the early '60's, Dr. J. W. Kelley, Wm. Shepherd (now of Oakland) and others used to "ground sluice" out at Buena Vista. One day, while they were working in the drift on the bedrock, they came across a quartz stringer which looked very favorable. They followed the stringer until it developed into quite a ledge, and the ledge showed free gold in no mean quantities. As the miners were only bunting for gravel gold, no particular work was done on the ledge outside of taking out a few loads of rock, and that rock remains on the dump at present. A few weeks ago Dr. Kelley and others relocated the claim, and by a long search found the ledge. The country around the Buena Vista Slide has become so covered with underbrush and debris that it was no easy task to find the ledge discovered so many years ago. It was found, however, and a party of miners are now drifting on it.

GRASS VALLEY NOTES.—Union, Feb. 12: The shaft of the Central North Star mine is down 140 feet. The shaft of the Telegraph mine is down 180 feet, and is showing a good-looking ledge. The Pennsylvania vein is showing two feet in width at the bottom of the mine, carrying an excellent quality of ore. The prospects of the mine are considered very encouraging. The W. Y. O. D. Company has declared a dividend (No. 6) of 10 cents per share, payable on the 15th inst. There are plenty more dividends in sight. The California is looking well, and the mill is now running regularly. The working force of the North Banner mine has been increased of late and the mill is now kept supplied with ore. The developments in the Hermosa mine are being watched with much interest, owing to the late encouraging developments.

GRASS VALLEY ENTERPRISE.—Nevada City Herald, Feb. 15: We don't believe there is a town on the Pacific Coast where the people, one and all, take right hold of new mining enterprises as they do in our sister city, Grass Valley. Tradesmen, miners and mechanics all own stock in some mine. Operators are given a chance, the people respond liberally, and most of their speculation seems to turn out well. And that is what makes Grass Valley the leading town in Nevada county to-day.

SPENCEVILLE MINERAL PAINT.—Grass Valley Union, Feb. 14: Mr. O. A. Woehler, one of the proprietors of the Spenceville copper mine, was in town yesterday. He says that during the winter not much is done in the way of making copper, the summer being the best season for the product, in the way they operate. As to the mineral paint, which they make from the refuse copper ores, the demand has exceeded the capacity of their works to furnish a supply, and it is the intention to increase the plant during the coming season. The company cannot fill the orders as fast as they come in, but during the present year, the machinery will be amplified sufficiently to supply all orders that may come.

Placer.

A RICH STRIKE.—Placer Herald, Feb. 13: The Richey mine, in what is known as Dirty Ditch ravine, just back of the old Greenwood toll house, a little more than a mile south of Auburn, is said to be very rich. A tunnel has been run from the ravine into the hill, and whether they have struck a channel or whether it is an old slide from one of the banks, we believe is not positively known, but report says the gravel is paying at the rate of about an ounce a day to the man.

Santa Barbara.

ASPHALTUM DISCOVERY.—Santa Barbara Independent, Feb. 13: A firm of Santa Barbara gentlemen have leased and will at once begin to work a mine of asphaltum that experts pronounce the finest found so far. A few months ago Mr. Ernest Atkinson was down the coast prospecting. On the Mullen place, 1½ miles from Rincon bridge, he discovered an outcropping of very hard bitumen. It was the hardest he had ever seen, and at once he decided to develop it. A firm was formed consisting of himself, his brother Richard, Cesar Lataillade and a gentleman by name of Puffenberger. This asphaltum is the hardest known. It is about 30 per cent of pure bitumen, and will make a pavement that is well nigh indestructible. There seems to be an inexhaustible supply. Boulders of this material weighing from 7 to 11 tons are found along the creek. Owing to the easy access to the mine, the ease of mining and the ease of handling this new material, it can be laid down to our market at

a less cost than any other bituminous rock. Other rocks will run at from 13 to 16 per cent of bitumen. The rock is so hard that if reduced to fragments it can be shipped to any point without trouble. A big pile of it can be left in the sun, and yet when desired can be moved with no more trouble than it requires to move other rocks. It can be transported without "sacking." This is the most important mineral discovery in this part of the State for a long time. It places at our doors the finest pavement in the world at a price much beneath what other cities will have to pay. It is a very important discovery and will be another source of revenue to this city. A gang of men is at work all the time on the mine.

Sierra.

BALD MT. EXTENSION.—Mt. Messenger, Feb. 13: At the annual meeting of the Bald Mt. Extension Co., in Downville, Monday evening, Jan. 18th, the following named stockholders were elected Directors for the ensuing year: H. T. Briggs, J. W. Orear, H. H. Purdy, R. Forbes, S. B. Davidson. The gold yield for January was 454½ ounces—\$8,453.12. The prospects are very bright for the new year. The mine at Happy Hollow is still in the hands of Deputy Sheriffs. Mr. Chapman, the principal owner, is at the mine. It was understood that the indebtedness would be paid off as soon as Mr. Chapman came up, but there appears to be some hitch. Fourteen men are prospecting in Nos. 3 and 4 tunnels at the Young America. As water is scarce, the mill has ceased running, but will be started in the spring. Considerable good-paying ore is in sight. The prospects are very favorable for this noted mining property.

Siskiyou.

KLAMATH RIVER NOTES.—Siskiyou Telegram, Feb. 12: Although we have had a very severe winter, yet the river has been so that miners could have run continuously, had they wished. The amount said to have been taken out of the Bentz Bar claim this season is \$200,000. This mine was worked by a company of Chinamen. The Phil Mott claim at Virginia Bar has run almost all winter. They also have taken out a large sum. Indications seem to point to a very busy season along the Klamath. Should Messrs. Pardee, Cook & Co. start up the Klamath River Improvement Co.'s enterprise, it must be of vast benefit to producers, besides the large number of men and teams employed. The snow melting so slowly is largely absorbed by the ground, which in turn will feed the smaller streams a longer time and enable those mining on them to work on later in the season than otherwise. There is talk of the Buckeye Bar Co. putting in a second large wing dam and working two derricks. Their claim paid well the past season. Among the new enterprises in this section is one which has already assumed proportions almost justifying its success. A large number of practical mining men of several years' experience on this river and some of the leading business men and stock men got together to see what could be done toward forming an incorporated company. They met at H. J. Barton's store at Oak Bar. When the ground, which by the way lies just below Horse creek on the north side of the Klamath, was proposed, an organization was formed immediately, developing work having shown that the ground is rich. Stock has already been taken to the amount of \$8000 shares, Mr. Barton with his accustomed energy taking a large number himself. Such names as Messrs. F. Kohl, J. B. LeDuc, Geo. Jensen, F. Anderson, A. C. Snow, J. J. Walters and Conrad Lichens are a few which I was informed had interested themselves in the company. Of course, they will hold the right to acquire mining ground as they advance. A few more such companies on this river, and there would be less money sent to China.

QUARTZ.—Yreka Journal, Feb. 10: Quartz mining is now in full blast with good success on Humburg Creek, and all the companies are doing well. Boyle & Co., at the head of North Fork, are getting out rock that pays \$60 per ton. Spencer & Co. are working their ledge with a large force, the quartz yielding about \$100 a ton. Van Nader & Marion, at Old Craggy, are taking out \$20 quartz, with improving prospects. Fahl & Lawson have a good ledge on South Fork, which is extensive and pays \$10 a ton. Cartwright & Phillips, on North Fork, have a ledge which pays \$40 a ton. Henley & Farish, at Rider Gulch, are taking out \$20 quartz. Rabbits & Hart, working a ledge near the forks of Humburg, are getting \$20 quartz. A man named Shefton, from below, has started up work on the Siskiyou ledge, the quartz from which is now being crushed at McCook's mill. Wm. Clark, opposite the Siskiyou, has also commenced taking out quartz, with good prospects. Harris & Keaton, at work above the Siskiyou, are realizing \$14 quartz. The McCook mill is kept running steadily, with plenty of custom crushing engaged ahead to keep the mill in constant operation.

Tuolumne.

GOLDEN GATE.—Tuolumne Independent, Feb. 13: The workmen at the Golden Gate mine struck last Sunday, as they had not been paid for two months. They demanded their pay and threatened to attach the property unless the money was forthcoming. The mine is being profitably worked, and there is money enough to meet all liabilities. A receiver was appointed by the San Francisco Court. When the case was transferred to Tuolumne county, a receiver was appointed by the court here, but he was not sure that he had the right to act until the other receivership had been disposed of, so the bullion produced at the mine passed into the hands of a receiver, but no one seemed to be willing to assume the risk of paying the accruing debts. The miners were paid their December wages last Sunday, and agreed to work a little longer. Their wages for January will be due the 15th of February. It is hoped

that the bills will be paid and that the mine will continue to be operated, as it is a paying property, of great benefit to the county.

BONANZA MINE.—The sale of the machinery of the Bonanza mine took place last Monday. Most of the machinery was purchased by Johnson, Oliver, Harriman and Keil, all of whom are owners of the mine. The sale, one of the partners tells us, has no bearing on the working of the mine. No information could be gained as to the probability of settlement of legal matters and a reopening of the mine on the lower level.

Trinity.

NUGGETS.—Rohnerville Herald, Feb. 13: A correspondent from New River says that Steve Noble and son came down from Pony creek recently with \$70.50, the result of two days' work. It was in nuggets, weighing from \$2 to \$35.75. The writer remembers the time when Steve Noble and his working companions took from a "pocket" in the bedrock on (we believe) Pony creek, a flat-iron shaped nugget of gold, weighing nearly \$230. That was about midway in the '60's.

NEW DITCH.—We learn that there is talk of digging a 16-mile ditch to afford water for the lower Trinity gravel mines; it is to tap the North Fork of the Trinity.

Yuba.

BROWN'S VALLEY PROSPECTS.—Marysville Democrat, Feb. 13: The winter weather has been favorable to the conduct of mines at Brown's Valley, and there has been good progress made. At the claim of Hibbert & Burris, just north of town, they have a 25-horse power engine at work with pump and hoisting apparatus, and the shaft is now down 110 feet, where they have already taken out about 150 tons of good quartz rock for crushing. Mr. Burris believes this quartz will average not less than \$30 or \$40 per ton, and they will build a mill this spring and expect to have it crushing and turning out gold in a few months hence. The Jefferson mine company have their main shaft down about 35 feet and are working six men daily in sinking, besides the engineer who attends to the hoisting works above ground. They have a good prospect in the ledge and believe the work will pay from the first when they get in position to take out quartz to advantage, and will also erect a mill for crushing it at an early day.

NEVADA.

Washoe District.

ANDES.—Virginia Enterprise, Feb. 13: North drift from east crosscut No. 6 on 420 level was advanced 25 feet, continuing in quartz. West crosscut from north drift from east crosscut No. 4 was extended 20 feet; formation, quartz of low assay value.

BULLION.—The joint east crosscut on north line, 1500 level, is out 63 feet; face, porphyry. The east crosscut, 120 feet south of north line, 1500 level, is out 53 feet; face in porphyry and streaks of quartz.

POTOSI.—The east crosscut from Potosi winze station, 1500 level, is out 102 feet; face in hard porphyry. The joint east crosscut on south line, 1400 level, is out 159 feet; face in porphyry. The upraise from 1230 level is connected with the 1130 level.

CHOLLAR.—The 1610 level west crosscut on north line is out 146 feet; face in porphyry. The south drift from above crosscut was advanced 31 feet; total length, 56 feet; face in low-grade quartz and porphyry. The east crosscut, 70 feet south of north line, 1500 level, was advanced 73 feet; total length, 103 feet; face in porphyry.

SILVER HILL.—The south drift from the Justice shaft, 490 level, is out 430 feet; face in gypsum and quartz.

OCCIDENTAL.—North drift, 750 level, is in 257 feet; face in quartz and porphyry. At a point in the south drift, 750 level, 350 feet from the winze station, have started an east crosscut in quartz and porphyry, giving low assays.

UNION.—The joint Sierra Nevada and Union west drift, 900 level, is out west of shaft, 1660 feet; face in porphyry and streaks of quartz. The Union south lateral drift, 1570 feet west of shaft, 900 level, is out 143 feet; face in clay and porphyry.

EXCHAMBER.—East crosscut, 150 feet south of north line, 600 level, is out 277 feet; face in porphyry. The joint southwest drift, 1800 level, is in 1090 feet, the last six feet in ledge matter showing bunches of quartz yielding low assays.

ALPHA.—The only work done at the Alpha shaft during the week has been repairing the 500 and 600 stations. Southwest drift from the Ward shaft, 1800 level, is out 1090 feet. The last six feet is in ledge matter showing bunches of quartz yielding low assays.

WARD COMBINATION SHAFT.—The southwest drift, 1800 level, is out from shaft 1090 feet—the last six feet in clay and porphyry and bunches of quartz yielding low assays.

NEW YORK.—The west drift from the shaft, 650 level, is out 420 feet; face in porphyry. During the past week, work in the north drift, 650 level, has been confined to repairs. The raise in No. 4 west crosscut, 650 level, is up 4 feet; top in quartz showing bunches of good ore.

SIERRA NEVADA.—The joint Sierra Nevada and Union west drift, 900 level, is out west of shaft, 1660 feet; face in porphyry and streaks of quartz. The north drift is out a total distance of 582 feet; face in porphyry.

CONS. CALIFORNIA AND VIRGINIA.—There has been extracted from all parts of the mine during the week 1019 1440-2000 tons of ore, which was shipped to the Morgan mill. The average assay value of all the ore worked at that mill during the week (980 tons) was \$28.50. Bullion shipped to Carson Mint, assay value, \$12,300.

Willow Creek District.

GOON ORE.—Silver State, Feb. 15: Peter Roberti, who arrived from Willow Creek yesterday, showed us some ore from a prospect

which he is developing in that district. The claim is situated in Eagle canyon, a short distance below the Ohio mine, and was but recently discovered. Little work has been done on it as yet, but nevertheless the ledge shows up strong, and assays of the ore run up to over \$100 in gold. The claim is owned by Dr. Hanson of this place.

Tuscarora District.

NEVADA QUEEN.—*Times-Review*, Feb. 12: Second level—Work in No. 1 south drift was suspended while starting No. 2 raise, which has been put up 20 feet, cutting into the vein at 7 feet, exposing 12 inches of very high-grade ore, assaying \$150 to \$700 per ton. Above this stratum is low-grade ore, assaying \$3 to \$27 per ton. Work has been resumed in the face of drift, and raise will be put up to hanging wall.

DEL MONTE.—Third level—No. 1 north drift has been extended 19 feet, cutting into the hanging wall side of the vein, exposing 8 inches of ore assaying \$55 per ton.

NORTH COMMONWEALTH.—Second level—West drift from No. 1 crosscut advanced 19 feet, small seams of ore in the face of the drift. No. 1 raise from west crosscut, progress 20 feet in the vein, in low-grade ore. Stopes above the level east from winze, produced 5 tons, \$285 per ton assay value, and 67 cars 2d class, \$47 per ton.

NORTH BELLE ISLE.—No. 4 north drift, south 500-foot level, extended 8 feet. The ground swells badly and requires timbering. Hoisting at the upper works will be suspended for the present. Hoisted 33 cars of second-class ore.

BELLE ISLE.—No. 1 winze, 200-foot level, extended 5 feet. The crosscut from No. 1 vein, 350-foot level, extended 6 feet, cutting a small vein of good ore. No. 1 winze on No. 3 vein, same level, extended 18 feet. Hoisted 4 cars second-class ore.

NAVAJO.—South intermediate drift below the 350-foot level, extended 2 feet. The work has been delayed by repairs on the hoisting engine.

ARIZONA.

THE COPPER KING CO.—*Solomonville Bulletin*, Feb. 13: Although not much has been said in the newspapers about the mining operations of the Copper King Mining Co. at Oro, four miles above Clifton on the San Francisco river, they have been extensive, thorough and satisfactory to all concerned. The development work done on the several claims, located two miles up the mountain from Oro, has shown what will evidently become one of the best-paying mining properties in that section. A 40-ton smelter was erected at Oro a little over a year ago, and since then several short runs have been made, turning out \$55,000 worth of hullion, the ore being hrought down from the mine over a rough trail on the back of burros. The ore is a high-grade copper, and the quantity is practically unlimited. The mines are located in what is known as a granite formation, and the elevation is 5000 feet above the San Francisco river. On the various claims there has been done about 4000 feet of tunnel, drift and shaft work. On the Union No. 2, at the upper terminal of the tramway, two tunnels have been run into the mountain following the vein. In the lower tunnel a tramway has been laid which leads to the ore platform where the smelter tramway buckets are loaded, and all the ore from this mine will be carried out through this tunnel. On the mine known as Union No. 1, a tunnel has been run in on the vein 220 feet, connecting with a shaft 160 feet deep, and another shaft is also being sunk on the lower end of this claim. The mines of the company also include the Weist or Greenlee group, on which a large amount of development work has been done. The width of the vein in Union No. 2 is 16 feet, with walls as perfect as the side of a plastered room and almost as perpendicular. The vein matter is 7 feet wide with an ore streak 9 feet wide. The work done on these mines has been with a view to making easy work in the future, and as a result there will be no necessity to lift the ore from the time it is shot out of the mine until it is dumped from the tramway buckets into the concentrator or smelter.

COLORADO.

CRIPPLE CREEK AND CREEDE.—*Mining and Scientific Review*, Feb. 15: The expectation of those familiar with the ground at Cripple Creek and Creede, is that when the snows disappear and prospectors are enabled to work intelligently, some wonderful revelations will be made. They had but just made a beginning last year when winter came on with unusual severity. No prospecting of consequence has been done in either district since last October. Many hundreds have gone in those districts prepared to await the time when they can begin systematic explorations. If we are favored with an early spring, which now seems probable, work will be pushed with unprecedented force, and upon the results achieved will be measured the prosperity and progress of all Colorado for the next five years. We predict a very large increase of population, and with it a renewal of growth in all the principal towns. One of the better features of these numerous strikes lies in the promised material increase of the output of gold. This metal seems to predominate at Cripple Creek, and also in the Boulder discoveries. In view of the low price of silver, which appears to be steadily declining, each new revelation of gold-bearing ground will be hailed with rejoicing. We have an idea, a sort of presentiment, that the region above Manitou and Green Mountain Falls will be found to contain great quantities of the yellow metal. Certain indications of its presence have already been brought to light, but owing to the depth of snow and the frozen soil, scarcely anything more than surface prospects have been realized, but the plans are formed for a thorough exploitation of those sections as soon as the weather will permit.

We are, unquestionably, on the eve of one of the most prosperous years in the history of the State. It is not shadowy, vague and uncertain, but as positive as anything can be. Our reliance is not upon the great mines of Creede, but upon a dozen other sections that offer equally favorable conditions.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING FEB. 9, 1892.

463,555.—ADJUSTING DEVICE FOR CABLE GRIPS, Anderson & Fairchild, S. F.
468,540.—ORE SEPARATOR—Henry Cane, Spokane Falls, Wash.
463,765.—CAR COUPLING—F. A. Fox, S. F.
468,655.—MACHINE FOR ROLLING HOLLOW RODS—J. S. Griffin, Roslyn, Wash.
468,658.—PENCIL ATTACHMENT—J. H. Hamill, Globe, Ariz.
468,344.—STUMP PULLER—A. Hopkins, Centralia, Wash.
468,544.—CRUSHING MILL—F. A. Huntington, S. F.
468,664.—FILTER—E. M. Knight, S. F.
468,665.—CARPENTER'S SQUARE—L. C. Labady, Tacoma, Wash.
468,430.—WHEEL PUMP—Thos. Powell, Stockton, Cal.
408,364.—BOOT CLEANER—J. B. Prickett, Forest Grove, Or.
468,694.—PROPELLING VESSELS—J. M. Robinson, Vacaville, Cal.
21,338.—DESIGN FOR KEY TAO—C. McIntosh, Tacoma, Wash.

The following brief list by telegraph, for Feb. 16 will appear more complete on receipt of mail advices:

Allen S. Brown, Los Angeles, Cal., ventilator and drip tray; Joseph Brumbaugh, Gold Hill, Oregon, ore crusher; John Downs, San Francisco, sewer gate; George W. Forbes, Guberville, Santa Clara county, cultivator; John H. Howard, Pasadena, cooking steamer; Edmund R. Mallett, San Francisco, swimming apparatus; Kelly McFarland, Clackamas, Oregon, coupler for caps and fuses for giant powder; Adolph Somer, Berkeley, viscid fatty compound; George A. Stevenson, Los Angeles, elevated railway structure and double traction motor for elevated railways; Charles W. Tremain, Portland, Oregon, steam stamp; Houghton Sanger, S. F., electric arc lamp; A. J. Painter, Pasadena, Cal., motor for street cars; L. A. Steiger, San Jose, Cal., interlocking brick paving blocks; Frank Walker, Los Angeles, Cal., automatic flushing apparatus.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CRUSHING MILL.—Frank A. Huntington, S. F. No. 463,544. Dated Feb. 9, 1892. This is one of that class of crushing mills in which swinging rollers are revolved within a pan and are swung outwardly by centrifugal force against an encircling ring-die. The invention consists, in connection with a pan and rollers therein, of means for imparting to said rollers a positive axially rotary motion, whereby the rollers, by contact with the pan, are caused to travel around therein. The object of the invention is to avoid any tendency of the rollers to slip and thus to prevent unequal wear upon the surfaces of their shoes. This object is attained by the positive rotary motion imparted to the rollers, whereby they cannot slip against the ring-die, or mass of ore between them and the die, but are made to rotate under all circumstances.

ADJUSTING DEVICE FOR CABLE GRIPS.—Clarence L. Anderson and George H. Fairchild, S. F. No. 463,555. Dated Feb. 9, 1892. In the grip mechanism employed on cable railways, removable shoes are usually employed to grasp the cable, and as these shoes become worn it is necessary to employ some means for setting the parts nearer together, so that the grip of the shoes upon the cable will be properly maintained and the throw of the lever, by which they are operated, will remain essentially the same in all conditions of the shoes. This adjustment is usually made by means of a screw which is situated below the floor of the car upon which the grip is carried, and it is thus necessary for the gripman to reach down below the floor from time to time to make the necessary adjustments. The object of this invention is to enable the gripman to make these adjustments from some point above the floor or the quadrant rack. It consists of a mechanism whereby the wear of the grip-shoes may be compensated for by a take-up device, so that the shoes will always have the proper grip upon the cable, whether new or nearly worn out, or when the grip is used upon cables of different sizes.

Our Agents.

J. C. HOAG—San Francisco.
R. G. BAILEY—San Francisco.
GEO. WILSON—Sacramento Co.
J. H. CROSSMAN—San Diego and San Bernardino Co's.

DON E. ABBOTT—Santa Barbara and Ventura Co's.

The California Miners' Association.

Officers, Committees and Constitution and By-Laws of the State Organization.

As the natural outgrowth of the State Mining Convention, and in accordance with the resolutions of that body, the California Miners' Association has been organized. The officers of the Association are as follows:

HON. J. H. NEFF.....President.
W. C. RALSTON.....Secretary.
THOS. R. EVERETT.....Ass't Secretary.
H. PICHOR.....Treasurer.

VICE-PRESIDENTS.

NAME.	COUNTY.
R. F. Grigsby.....	Napa
Henry Martin.....	Trinity
Geo. W. Thomas.....	Marin
Frank R. Welsch.....	Sierra
Woolston Baugbart.....	San Mateo
R. H. Campbell.....	Siskiyou
Jas. O'Brien.....	Yuba
Frank Fitzgerald.....	Inyo
A. B. Call.....	Amador
Dixon Brabban.....	Plumas
J. F. Ryan.....	Humboldt
Aaron Bell.....	Shasta
H. O. Harvey.....	Sacramento
D. K. Perkins.....	Butte
A. M. Hardie.....	San Luis Obispo
A. Tregidgo.....	Nevada
Ex-Gov. H. G. Blaisdell.....	Alameda
T. B. Morse.....	Calaveras
Hon. A. M. Clark.....	Fresno
Hon. J. K. Luttrell.....	Sonoma
J. J. Crawford.....	El Dorado
R. M. Folger.....	Mono
Geo. F. Hoyt.....	Orange
R. McMurray.....	San Francisco
W. S. Chapman.....	San Francisco
J. C. Stump.....	San Francisco
C. T. Lacy.....	San Francisco
A. J. Ralston.....	San Francisco
John W. Maxwell.....	Tuolumne
Hon. R. Clark.....	Colusa
C. F. Reed.....	Placer

James H. Lawrence.....	Merced

EXECUTIVE COMMITTEE.

Hon. J. H. Neff, Placer.	H. A. McCrancy, Lake.
Louis Glass, San Francisco.	Jas. Tunstead, Marin.
Col. Dan M. Burns, S. F.	A. M. Bryant, Mono.
Col. F. McLaughlin, Butte.	W. K. Alderley, Napa.
S. K. Thornton, S. F.	Chas. Bogan, Mariposa.
Wm. Irelan Jr., S. F.	Jas. H. Lawrence, Merced.
Hon. C. W. Cross, Nevada.	Hon. J. M. Walling, Nevada.
Chas. G. Yale, San Francisco.	D. C. Fixley, Oage.
J. B. Hobson, Placer.	John Spaulding, Placer.
Hon. Edw. Coleman, Nevada.	W. W. Kellogg, Plumas.
Hon. A. Waltham, S. F.	M. M. Drew, Sacramento.
Hon. J. K. Luttrell, Sonoma.	Thos. R. Church, S. F.
Ex-Gov. H. G. Blaisdell, Alabama.	John Hays Hammond, S. F.
Hon. Jno. Daggett, Siskiyou.	Myron Angel, S. L. Otisop.
Hon. E. O. Voorheis, Amador.	N. J. Brittan, San Mateo.
E. W. Fogg, Butte.	George M. Finney, Sierra.
John E. Davis, Calaveras.	R. G. Hart, Shasta.
John Boggs, Colusa.	A. W. Dana, Sonoma.
Hon. Thos. Fraser, El Dorado.	A. Hewell, Stanislaus.
Mr. McDonald, Fresno.	C. P. Berry, Sutter.
W. H. Pratt, Humboldt.	C. McTarnahan, Tuolumne.
Hon. Patrick Reddy, Inyo.	G. C. Kimball, Tehama.
J. O. Miller, Kern.	John McMurray, Trinity.
	G. G. Mayo, Yuba.

FINANCE COMMITTEE.

Louis Glass, San Francisco.	Edward Coleman, Grass Valley.
Wm. Irelan Jr., S. F.	S. K. Thornton, S. F.
N. J. Brittan, San Mateo.	John Hays Hammond, S. F.

COMMITTEE TO FORMULATE AND PROMOTE THE ADOPTION OF AMENDMENTS TO MINING STATUTES.

Hon. Niles Searles, of Ne-J. M. Fulweller, Placer.
vada.
Hon. C. W. Cross, S. F.
Hon. J. K. Luttrell, Sonoma.

COMMITTEE OF CONFERENCE WITH RIVER AND HARBOR CONVENTION COMMITTEE.

R. G. Hart, Shasta.	Wm. Irelan Jr., S. F.
Frank McLaughlin, Butte.	J. B. Hobson, Placer.
Hon. J. K. Luttrell, Sonoma.	

DELEGATES TO WASHINGTON.

Hon. Niles Searles, of Nevada County.
Hon. J. K. Luttrell, of Sonoma County.
Robt McMurray, of Nevada County.
J. B. Hobson, of Placer County.

THE CONSTITUTION.

ARTICLE I.

SECTION 1. This organization shall be known as the California Miners' Association.

SEC. 2. The objects of this Association shall be to protect, develop and foster the mining industry of the State of California in all its branches.

ARTICLE II.

SECTION 1. The officers of this organization shall be a President, Vice-President, Secretary, Assistant Secretary, Treasurer, and an Executive Committee, consisting of eleven members selected at large, and one additional from each county represented in the Association, to be selected by the President of this Association.

SEC. 2. All officers to serve for the period of one year, or until their successors are elected or appointed.

SEC. 3. The President and Secretary of the Association shall be ex officio President and Secretary of the Executive Committee.

SEC. 4. There shall be an annual meeting of this Association held in San Francisco on the second Monday in October in each year.

ARTICLE III.

SECTION 1. The Executive Committee of this Association shall have full power to transact all business of the Association, except such as may be transacted at any General Meeting of the Association.

SEC. 2. The President shall preside at all meetings of the Association, sign all drafts and checks authorized to be drawn on the Treasurer, and perform such other duties as are herein prescribed, as usually pertain to that office. In the absence of the President, a Vice-President shall perform the duties of that office, taking precedence in the order of their appointment, unless otherwise ordered by the Association.

SEC. 3. It shall be the duty of the Secretary to keep full and correct minutes of all meetings of this Association, and of the Executive Committee, and shall render annually to the Association a full report of all the transactions of his office; receive all moneys of the Association, paying the same to the Treasurer and taking his receipts therefor, and perform such other duties as may be required of him; either by the Association or the Executive Committee thereof. The Secretary shall give bonds in such sum as the Executive Committee may determine, for the faithful performance of his duties, such bond to be approved by the President.

SEC. 4. It shall be the duty of the Treasurer to receive all moneys of the Association, and safely keep the same, and pay the same only upon orders drawn by the President and countersigned by the Secretary. He shall render an annual report to the Association, and upon the request of the President of the Executive Committee, shall, at any time, furnish to said committee, a statement of the condition of the funds of the Association. The Treasurer shall give bonds in such sum as the Executive Committee may determine, for the faithful performance of his duties, such bond to be approved by the President.

ARTICLE IV.

SECTION 1. The headquarters of this Association shall be at the city and county of San Francisco.

SEC. 2. It shall be the duty of the Vice-Presidents of this Association to at once proceed to the formation of a County Organization in their respective counties. Such County Organizations shall be recognized as branches of this Association.

SEC. 3. All persons friendly to the mining interests are eligible to become members of this Association. In the event that there is no County Organization, such person may unite with the State Association by forwarding his name to the Secretary thereof, and paying a membership fee of one dollar (\$1.00), upon which he shall be furnished by the Secretary with a certificate of membership. But this shall not constitute him a delegate to the meetings of the Association. County Organizations may admit nonresidents as members.

SEC. 4. Each County Organization shall be entitled to one delegate to the State Conventions for each ten members, to be selected as such County Organization may determine.

This Constitution may be amended at any General Meeting of the Association upon a vote of the majority of delegates present.

Adopted by the Executive Committee, Jan. 22, 1892.

BY-LAWS.

SECTION I.—The Executive Committee shall be authorized to appoint from among themselves such subcommittees as they may determine. They shall fill all vacancies of the officers of the Association or members of any committee. The Executive Committee shall have power to remove any officer of this Association who is derelict in his duty, upon a two-thirds vote of all the members present at such meeting, provided that no officer shall be removed until he shall have been notified of the intended action of the committee, and afforded an opportunity to be heard.

SEC. II.—The Executive Committee may, from time to time, levy such assessments upon county organizations as the necessities of this Association may require. Any county organization delinquent at the time of the annual meeting, on account of any assessments levied 90 days preceding such date, may be deprived of representation.

SEC. III.—All parliamentary questions shall be determined in accordance with Cushing's Manual, unless otherwise ordered by the Association.

SEC. IV.—Unless otherwise ordered, the President shall appoint all committees of this Association.

SEC. V.—The meetings of the Executive Committee shall be held at such times as they may determine. Special meetings of said committee may be called by the President whenever deemed advisable, and upon the written request of any five members of the Executive Committee the President shall call a meeting thereof.

SEC. VI.—At all meetings of the Executive Committee seven members shall constitute a quorum for the transaction of business. Whenever practicable, each member of the committee shall be notified personally or by mail of such intended meeting.

SEC. VII.—The Secretary and Treasurer shall receive such compensation for their services as the Executive Committee may, from time to time, determine.

These by-laws may be amended at any annual meeting of the Association, upon a vote of the majority of delegates present.

Adopted by the Executive Committee Jan. 22d, 1892.

The headquarters of the California Miners' Association have been established at room 23, No. 331 Pine St., S. F., Stock Exchange Building.

MECHANICAL PROGRESS.

SOLIDIFYING STEEL INGOTS WITH SLAG. Mr. James Munton, Superintendent of the Chicago Tire and Spring Works at Melrose, Illinois, has been granted a patent for a process of solidifying steel ingots. The process consists in pouring molten steel slag on the molten steel immediately after the latter has been poured into the mold and before it has had time to set. Mr. Munton says that he found the steel castings thus treated to be dense and homogeneous and free from pipes and blow-holes. He ascribes the improvement in the quality of the casting partly to the weight of the slag upon the steel and partly to the fact that the molten slag serves to keep the surface of the steel longer in a molten or liquid condition and thus allow greater time and freedom for the escape of gases from the steel, and the passage upward of dross or impurities contained in the metal. He uses two ladles, one for the steel and the other for the slag, so that the latter can follow the former very quickly. The process is adapted to the pouring of all classes of all steel ingots, but Mr. Munton has used it mainly in the production of annular ingots for tire blooms to be rolled into tires by his patent process. A tire ingot 10 inches high, on which 2 inches of slag has been run, falls two and one-half inches in the center, which shows how much the ingot condenses. It is noticed that the slag continues liquid after the steel has set. The slag is easily removed afterward, as it has no tendency to unite with the steel. Not more than one-half, and often but one-third, as much metal is required to be sheared off the top of ingots treated in this way, as compared with those poured without the slag covering.

A NEW ALUMINUM FLUX, called stephenite from the name of the inventor, is receiving considerable attention at Birmingham, England. It is composed of alumina and emery, the alumina being about 70 per cent. In its natural state, this flux is not volatilizable like the refined commercial aluminum, but in a blast cupola or reverberatory furnace it gives off its metallic gases or vapors, these uniting with the fusible iron, for which they have great affinity, and which acts as a condensing agent, while all impurities go to the liquid slag and are drawn off in the usual manner. It is found that metal manufactured by means of this flux will work equally well under the hammer with the most malleable wrought iron, and will harden up to the hardest steel. It also appears that the metal will work over and over again, becoming hard or soft as the operator may desire, tests having likewise proved that, in its soft state, it will stand a tensile strain of about 38 tons on the square inch, and, when hardened, of about 48 tons. Another point upon which stress is laid is that the use of such a flux causes the iron to flow in a much more liquid state, and to remain in that condition a considerable time longer than by the ordinary process, thus preventing blow-holes and faulty castings, which is, of course, a great desideratum. It is regarded as a great advantage that, by this means, iron foundries are enabled to produce their own steel castings, independent of steel works, by simply smelting scrap steel in their own crucibles.

MACHINERY-MADE TOOLS.—There are very few lines of manufactured articles that have not undergone wonderful changes, especially in the means and methods of their production, in the last half century. Hand work has been succeeded by machine work, and notwithstanding the very common argument against this change, the claim being made that the quality of the work is thus less accurate and perfect, it is a fact that not only is it more accurate and perfect, but every piece is exactly alike, the quality equally good and the quantity largely increased. A machine once carefully and accurately set, and kept in proper repair, never varies. The work is uniform and true. An example of this is well illustrated in the manufacture of that very useful article in every shop and factory, the file. It is but a few years ago that these were all, or nearly all, made by hand, enhancing their cost and not materially increasing their durability and service. To-day, nine-tenths of all the files used in this country are made by machinery. The competition in the business, largely controlled by quality, has worked to make their manufacture one in which the most perfect machines are necessary, and this spirit of rivalry has brought the machines to such a state of perfection that wonderfully fine and accurate work is accomplished by them. With the machines now in use, a file is cut with teeth varying from 14 to the inch to a number so fine as to require a magnify-

ing glass to count them, and as accurate and perfect in shape as the coarser cuts. For their production, about 5000 tons of specially prepared steel are consumed annually.

MACHINERY IN OFFICE BUILDINGS.—The construction of large buildings, especially office buildings, where large numbers of people are gathered together under one roof, is calling for a large amount of machinery to operate elevators and for general lighting and heating purposes, raising water, etc. The great Masonic Temple at Chicago, which is 21 stories in height, including basement and attic, is furnished with two 500 horse power Corliss engines, driven by eight large steel boilers—a power plant sufficient to operate quite a large manufacturing establishment. This power, says a Chicago paper, will all be needed for adapting the building to the use of its tenants for office purposes. There are to be 17 elevators, with a carrying capacity of 50,000 persons daily, and an electric light system capable of supplying 7000 lights. Water will have to be pumped to tanks on the roof to furnish such a tall building as this with the water required, as it is 302 feet from the level of the street to the roof line. It is estimated by competent and well-informed engineers that the power plants now installed in the office buildings of Chicago would aggregate almost, if not quite as much horse power as one of the largest and best equipped steel rail works. This is a remarkable incident of the progress of the age.

A NEW CEMENT FOR IRON.—The following is given as a mixture for joining pieces of iron together: Equal parts of sulphur and white lead, with about one-sixth proportion of borax, are the constituents of the mixture, and the three should be thoroughly incorporated together so as to form one homogeneous mass. When the composition is to be applied, it should be wetted with strong sulphuric acid, and a thin layer of it placed between the two pieces of iron to be connected, these being at once pressed together. The *Chemical Trades Journal* says: "It is stated that the cement will hold so firmly as to resist the blows of a steam hammer, and dry so completely in a few days as to leave no trace of the cement, the work then presenting the appearance of welding."

AMERICAN INVENTORS WIN.—A patent decision has just been made in London, which involves millions of dollars. The case is that of the Nettlefolds, of Birmingham, the wealthiest screw manufacturing company in England, against the Providence Screw Manufacturing Company. The suit was commenced by the former for infringement upon its English patent, when the Providence Company commenced placing its machinery in England, which is claimed to be superior to any other yet invented. The English Justice gave a strong decision in favor of the American company, which will now proceed to put down in England a very large and expensive plant. This machinery will be made in this country and taken across the Atlantic to be set up.

THE DURABILITY OF IRON RAILWAY BRIDGES is being carefully investigated by several of the European Governments as a consequence of the many late serious bridge disasters. The result of extended English and German investigation seems to show that under the most favorable circumstances, iron bridges are not safe for a period exceeding 75 years; and under certain conditions, their life is much shorter. The method of manufacture is of the least importance in this estimate of durability. The effect of a more or less heavy traffic upon the fiber resistance in the materials of construction plays the important part, and the pounding under train motion and the vibration due to rolling loads wear out the bridge.

NEW BAND-SAWING MACHINE.—Among the recent mechanical novelties of a practical character brought forward is a band-sawing machine, especially adapted to the use of wheel and carriage makers, chair and car shop work, where an inexpensive machine for heavy duty is wanted. The machine carries a saw from one-fourth to two inches wide, and has leather-covered saw pulleys of 42 inches diameter, the table being 39 by 33 inches, made of hardwood strips, and capable of being elevated to an angle of 27 degrees.

PADDLED HORSESHOES.—A new system of shoeing horses has recently been invented in England. By it the iron shoes are fixed to others made of sail canvas, which are then cemented to the hoof. Shoes fixed this way have been worn quite thin without moving. The process has been patented in England.—Australasian Coach Builder and Saddler.

SCIENTIFIC PROGRESS.

Measuring the Speed of Projectiles.

A Frenchman, Captain Journee, has improved, or at least has modified, the usual mode of measuring the speed of projectiles at great velocities, say from 1600 to 2500 feet per second. He also explains the peculiar phenomena of sound connected with such rapid motion of cannon balls. In his explanation, he says: The ball, which acquires a velocity superior to that of the propagation of sound, compresses the air in front of it. The compressed wave is stationary; when it passes by the ear the dry sound of the explosion is heard once only. There is besides a spherical wave, due to the discharge, which moves with the ordinary speed. The two sounds, arising from the two waves, are separated by an absolute silence. The stationary wave is utilized in order to indicate at a certain point the passage of the projectile, and thus to permit of its velocity being measured.

Let it be supposed that there are two apparatus disposed in the plane of direction capable of working and of interrupting an electric circuit under the influence of an abrupt variation of the atmospheric pressure. Imagine, further, a projectile fired at an angle of no particular degree. The compressed wave will interrupt the circuit when it strikes the apparatus, and will indicate the projectile being at a certain point in its flight. The length of time which separates the two indications, the knowledge of the firing angle, of the usual speed of sound, and of the position of the apparatus will, by the aid of a series of analytic deductions, result in the ascertainment of the velocity. This method offers the following advantages: It permits of the measurement of speeds at any angles for the initial velocity and at any distances for the remaining velocities. After each shot the apparatus are again ready for immediate action; they therefore require no attention. By this method the length of time occupied in the flight of projectiles and the duration of combustion can be measured, it appears, with a precision unknown up to the present. Mons. Cousin, artillery, has invented an interruptive apparatus which is very simple in design, and which yields results pointing to remarkable sensitiveness and accuracy.

THE GREAT SUN SPOT.—The astronomers all over the world are just at this time watching with much interest a very large sun spot, or rather cluster of spots, which are so large and so distinct that they may be quite plainly seen by the naked eye, protected with smoked glass. The spot is oval in form, with a greater diameter of about 100,000 miles and 500 for its smaller. It occupies, in its longer measurement, about one-seventh of the sun's diameter—or a superficial area about nine times as large as that of the earth's hemisphere. Prof. Wendell, of Cambridge if we are not mistaken, says: "It is the most magnificent display of the kind which has been seen during the last 20 years. It will be immediately followed by a magnetic disturbance on the earth, and we may expect a violent storm somewhere on our surface before long. The period of solar disturbance, ten years apart, will return next year. The effects on earth will begin to be manifest this summer, and the atmospheric disturbances will increase in intensity for the next two months. During this period there will be an abnormal increase in the number and intensity of the cyclones." If this spot should be the cause of any serious electrical or meteorological disturbance in the earth's atmosphere, we see no reason why such manifestations should not be expected in a much shorter period than that named by Prof. Wendell. It is scarcely conceivable that sun spots should produce any disturbance in the earth's atmosphere beyond, possibly, something of a merely mild electrical character.

THE PHONOGRAPH ENABLES THE DUMB TO TALK.—There seems to be much probability that the phonograph may soon have quite a new and important application. Mr. Edison, we believe, claims that its application is as yet in its infancy, and some recent experiments at Indianapolis seem to warrant the correctness of that assertion. An apparently well authenticated report has been made that the authorities of the Deaf and Dumb Institute of that city have been making some interesting experiments, and believe that in connection with it they can teach the majority of the deaf mutes under their charge to talk. They find that the instrument concentrates the sound at the drum of the ear in such a way that many of their pupils, otherwise deaf, are enabled to hear. The phonograph was tried with 27 boys and 22 girls. Of these only three girls were un-

able to hear anything at all. Twenty boys and 20 girls could hear instrumental music, while 11 boys and 15 girls could distinguish spoken words. Of the 56 whose hearing was tested by placing the phonograph tubes in their ears, 28 could hear best with the left ear and 14 with the right, while 11 heard alike with both.

Animal Electricity.

Prof. J. G. McKendrick recently delivered a lecture before the British Royal Institution on the subject of "Life in Motion or the Animal Machine." The professor commenced by reminding his audience that he had in a previous lecture spoken of the analogy which existed between the muscle as a little engine, and other engines, and how the animal body yields a larger percentage of power in proportion to material consumed than does any engine. The lecturer then said that the subject of which he was about to treat was the electricity given off by animals.

It had for a great many years been known that certain animals were possessed of electricity, though the subject had only of comparatively recent years received the close attention of scientific investigators; and we yet had more recently learned that every bit of life has its share of electricity. The lecturer proceeded to show, with the aid of a most delicate galvanometer, the electric current which came from a piece of frog muscle, and afterward from the frog's eye and heart. Professor McKendrick showed, by a simple experiment, the strength of current from his own hand, and the way in which the current became intensified on his contracting the muscles of his arm, so as to deflect the needle to the right on his contracting the muscles of his right arm, and to the left on his doing so to the left arm.

Electricity in animal life was most marked in certain fishes, some 50 species of which were possessed of it in a considerable degree, though only some half-dozen of these were at all well known—the Torpedo Ray, the Gymnotus, and a fish found in the Nile, and called by the Arabs the thunder fish, being the most familiar examples of these. That the electrical organs were under the control of the fish, had been proved by an interesting experiment; a strong current of electricity being sent through a vessel containing some specimens of Gymnotus, the fish at once tried a shock on the unknown foe, but finding that unavailing, placed themselves in a position in which the current would pass through them sideways—precisely as an electrician would do if he should be similarly situated.

In conclusion, the professor told his young hearers that, although so much was already known, there was yet plenty for future workers to do, as the subject of which he had been talking was far from a settlement. He advised them to keep their minds open for the reception of the truth, from whatever quarter it might come.

INDIVIDUALITY IN HUMAN HAIR.—One of the wonders revealed by the microscope is that human hair possesses a marked individuality. Not long ago, a single hair—the evidence in a murder case—was shown Dr. Jeserich, with the request that he determine whether it was from the head of the supposed murderer, whose hair was of the same color. After examination, the specialist decided that it was sufficiently unlike those of the suspected man to acquit him. The real murderer was subsequently captured, and his hairs were found to be identical in character with the one first examined.

COLORED PHOTOGRAPHS OF STAINED GLASS.—A Swiss doctor has succeeded, after a long series of experiments, in obtaining photographs of stained glass windows in their original colors. His photographs contain red, violet, yellow, green and white. They were sent to Dusseldorf, after passing from hand to hand on the way, and the photographic journals speak favorably of their retention of the colors. These samples were taken in 20 seconds by the mid-day sun.

"THE SKY is for all of us. Bright as it is, it is not too bright nor good for human natures daily food. Sometimes gentle, sometimes capricious, sometimes awful, it is never quite the same for two moments together; almost human in its passions, almost spiritual in its tenderness, almost divine in its infinity, its appeal to what is immortal in us is as distinct as its ministry of chastisement or of blessing to what is mortal."

BELTS running over pulleys of small diameter at high speed ought to be as thin and as wide as possible. Orange tan leather of uniform thickness answers remarkably well.

ELECTRICITY.

Electrical versus Gas Light.

Considerable attention is just now being paid in Germany to the comparative value of electrical and gas light, and what relations the one should bear to the other. The question is being agitated both in Government circles and by capitalists. The Government has in contemplation an act "to regulate electrical enterprises." The act appears to refer only to lighting plants, and not to other electrical enterprises. "An electrical convention was recently held of persons engaged in electric-lighting, at which 150 cities and large towns were represented. The object of the meeting was to ascertain, as far as practical, what progress has been made in the science of electrical-lighting and what there might be of value in it to their respective communities—whether by the establishment of electrical light plants the general welfare of the communities was advanced, or whether the benefits accrued to a limited portion of the people only.

The question was considered whether, by the use of electricity in lighting, the sales of gas were curtailed, and if so, whether such curtailment had in any way advanced the price of gas, and thereby, the general cost of lighting to the people at large. The general question, whether the development of electricity for lighting purposes has really been any great step forward in human progress was also considered.

The conclusion arrived at seemed to be that only certain consumers, such as theaters, hotels and large stores and dwellings, were especially benefited. It was held that the introduction of gas had marked a new epoch in civilization generally, as had steam for power. Electricity had done the same in the more convenient use of power, and in telegraphic communication. But it was denied that electricity for light had as yet proven of any large benefit to the general public, even in the midst of large communities. Electricity had failed in producing a light comparative to gas in useful brilliancy, steadiness, reliability and cheapness. Its greatest value was in paralleling gas for special purposes and in furnishing light without heat and as a non-consumer of oxygen.

Gas was everywhere holding its own, and bade fair to continue to be of the most service to the community at large, until the science of electric-lighting had reached far in advance of its present standpoint. Thus far, electricity had caused a large general increase in quantity and expense of lighting without furnishing any adequate return. The convention commended the Postmaster-General of Germany for the advice which he had given to his countrymen and gas producers to go slow and consider well whether it will pay them to further parallel existing gas works by either arc or incandescent electric lights.

It is evident that both the discussion and advice were decidedly from the gas manufacturers' standpoint. While some truth worthy of consideration was evolved, it is doubtful whether much of practical value was brought out which people of this progressive age will heed. We imagine that the grave advice of that really able and experienced body of gas producers will have much influence in deterring capitalists from continuing to extend their investments in electric light works.

Electric Roads in Southern California.

The Los Angeles *Herald* says, editorially, that the manager and receiver of the cable system of Los Angeles is so thoroughly convinced of the superiority of electricity over cables as a propulsive force that he will substitute electric cars for those now being operated by horse power, and not use the cable system as employed on the more recently constructed portion of the company's lines. The *Herald* further adds that the electric roads have come to stay.

The San Diego *Union* says that the electric roads which Mr. Spreckels is now constructing in that city will be supplied with the very latest and most approved appliances for speed, comfort and convenience, and the investment by this wealthy and sagacious family of business men of so large a sum of money in San Diego at this time is most substantial and convincing proof that capitalists who are well informed as to conditions here, have assured faith in the city's early and rapid growth.

The *Union* expresses its own opinion in regard to electric roads as follows: A year ago electric street-railways were operating in 127 Eastern cities, and it is probable that this number has been doubled since that time. There are, of course, economic and other reasons for the rapidity with which

these roads have been multiplied, and for the fact that they are supplanting horse car roads everywhere. In the first place, they can be operated for from 20 to 22 per cent less than the horse car railroad. In the second place, the heavy cars they are compelled to use require a substantial and well-built roadbed, which insures smoother running; and in the third place, they can be run up to a maximum rate of speed allowed by law, and thus economize the time of people in going to and from their homes and places of business. It will be admitted that these reasons are conclusive, and establish the electric road as the one that will inevitably take the place of horse car lines in all cities of any importance.

Long Distance Telephoning.

The advantages of long distance telephoning are becoming more and more apparent. In response to a question on the subject recently addressed to Superintendent Mallet, of the Bell Telephone Co., that gentleman said:

"Business men are availing themselves of its advantages to carry on communication that could not be done by telegraph. They can discuss questions and negotiate as though they were face to face. The metallic circuit in use on the long distance line conveys the message perfectly. Where one has a city telephone with a metallic circuit, he can get a message from New York or Boston in his own office; but with the ordinary ground circuit, one living here could send a message to New York that would be understood, but he would not be likely to receive a distinct one in return. A new line has been opened to Pittsburgh, and is now being extended to Chicago. There is a comparatively greater demand for long distance service in New York, Philadelphia and Boston than elsewhere. The greater population at those points does not account for it altogether; the value of the system appears to have received quicker recognition there. In the city of Rochester there is one firm that pays \$75 to \$80 a month for its telephoning, and another paid over \$125 last month."

THE TELEPHONE IN EUROPE.

Some interesting and rather surprising statistics on the use of the telephone in European countries have been collected. In London, the greatest commercial city of the world, only 1.5 persons in 1000 use the telephone. The telephone is used most in countries where the service is owned or controlled by the State. In Germany, Switzerland, Norway and Sweden, from 100 to 400 persons in every 100,000 of the population are subscribers. In Great Britain only 58 persons in 100,000 use the telephone. In Berlin 11, and in Paris 4.2 out of every 1000 inhabitants use the telephone.

It is reported that the British postoffice authorities contemplate opening a telephone line between London and Dublin. The working of the Paris-London telephone has so far been attended with marked success, and it is doubtless due to this circumstance that the new line is projected.

The Electric Road About New York.

A striking example of the efficiency of electric roads is seen in the great satisfaction which is being given to both stockholders and passengers by the long suburban road from Newark to Orange, a popular locality in which New Yorkers seek to spend their nights and leisure from the turmoil of the city. The road is operated by the trolley system. A New York paper speaks of this road as follows: Talking about the mule and horse going, the trolley can beat them at their own game, for it certainly goes at least 50 per cent faster, retiring the animals at the same time. On the new electric line just opened between Newark and Orange, the time between the terminals of the line has been reduced from an hour and seven minutes to 42 minutes; and yet some people persist in wondering why the trolley system is a favorite and why the receipts of a road increase as soon as the horse is discarded and the electric motor put in its place. Just consider the number of friends the new electric line will make and the number of extra 25-minute naps that will be taken in the morning. The wonder is, not that electricity is so frequently introduced, but that horse cars should be tolerated at all when the railway companies can be persuaded into using electricity.

We alluded last week to the fact that the opposition of the Mayor of Brooklyn, N. Y., to the trolley system had finally been withdrawn. The *Eagle* of that city, in alluding to this matter, says:

The opposition to the change has been wild and absurd as usual, with the familiar stories of plague, nuisance and sudden

death, and without a single fact in support of the allegations. The paper also congratulates the citizens on the coming addition to the means of rapid transit, and points out that in like manner, though more vigorously, other boons were fought against in the City of Churches, such as the introduction of the water supply, the horse railroads, paid firemen, elevated roads, and uniformed police. All these things, though bitterly opposed, have come, and now everybody rejoices at their existence. So it will be with the trolley system. We are heartily glad to see that the street railway companies have made so successful a fight for themselves and for the public they serve.

AN APPROPRIATE OPENING.—When the President of the United States touches the electric key which is to start the machinery of the World's Columbian Exposition, it is expected that the signal will neither be confined to the Exposition nor even to the vast continent, in commemoration of whose discovery that great Exposition will be given, but the signal will most appropriately have a world-wide reach. Every city of any considerable size both in Europe and America will at that moment be placed in electrical connection with the little key upon which the President will press his finger. Both Europe and America will feel the impulse which will start the machinery at the World's Fair, and which will be followed by the ringing of bells, the screeching of steam whistles and the display of the national flag in all the chief cities and towns in the United States. Such will be a most appropriate opening of the celebration of an event in which all the world has an interest, and which has made and left an impress upon the world's progress such as no other event has done since the dawn of creation.

ACCUMULATION OF ELECTRICITY BY GRAVITY.—It is reported that the Northern Railway Co., of France, will make experiments with an electric locomotive on their line from Paris to St. Denis. On this line, the trip in one direction being all down grade, does not require the use of a locomotive. The experiments are being made with a view of being able to keep the motors in motion on the down grade and restore to the batteries a portion of the power generated by the gravity of the train, thus saving a great amount of energy which, under ordinary circumstances, would be entirely lost.

AN ELECTRIC LIGHTING PLANT, according to the *Oroville Mercury*, has been placed in the Stow quartz mine at Forbestown. The dynamo will be run by the same water power that propels the machinery to the mill. Wires will run underground to all portions, and incandescent lights will take the place of the candles heretofore used by the miners in the drifts and tunnels. The works above ground will be illuminated with large arc lights. This improvement marks an important epoch in quartz mining in Butte, as it is the first of the kind to be made.

VIOLETS FORCED BY ELECTRICITY.—A Parisian electrician, it is reported, has succeeded in forcing violets by the aid of his battery, and recently sent a bunch of these fledglings, only four hours old, to the ex-Empress Eugenie.

GOOD HEALTH.

The Human Ear.

The human ear is a much more delicate organ than most people suppose. It is extremely dangerous to interfere with it by use of earpicks, or any of the various instruments used for the purpose of cleaning it from wax. The wax is a natural secretion, and unless the ear becomes diseased it does not accumulate any faster than is necessary to protect the passage from the entrance of insects and various particles which might otherwise be forced in and tend to interfere permanently with the hearing. The greatest care is necessary in washing the ears of little children. They should be washed outside, but on the inside only so far as the finger wrapped in a soft towel will go. The practice of forcing a hair pin or any other hard instrument into the ear passage is fraught with danger of injuring the membrane and causing permanent deafness.

Earache is a malady of childhood and causes most distressing pain. The simplest remedy for it is to take a little cotton dipped in warm sweet oil and put it in the ear passage. A danger that may arise from doing so simple a thing as this is that minute particles of the cotton may be left in the ear.

To prevent this, some physicians advise making a little wad of the cotton and wrapping it in the finest and thinnest linen cambric that can be found, and dipping this in

warm sweet oil. In case of intense pain, a few drops of hot laudanum or camphor may be used with the oil. When foreign bodies get into the ear they should be removed by syringing them out with warm water. To attempt to remove anything from the ear passage by forcing an instrument in is a rash thing for anyone except an aurist to undertake. The best medical practitioners refuse to treat affections of the ear or eye, but send their patients to specialists.

WONDERFUL TRAINING OF THE EARS. It is really wonderful in regard to the acuteness to which the human ear may be trained.

At the meeting of the locomotive engineers, to be held in Cape May during August, an interesting paper will be read by H. H. Dantzer, formerly an engineer on the Reading railroad, but now a contractor in West Philadelphia. The paper will deal entirely with the wonderful manner in which engineers on railroads, steamboats and the masters of mammoth machinery ascertain accurately and instantly when anything goes wrong with the machinery under their control.

Strange as it may seem, the only reliable friend of the engineer is a well-trained ear. The greater part of Mr. Dantzer's paper is filled with incidents relating to railroad work, but the really wonderful incidents of which he treats are taken from the mammoth press-rooms in which Philadelphia abounds.

Mr. Dantzer's paper tells of many queer incidents of his experience as a railroad engineer. The master of a locomotive gets to know his engine as a mother does her child. In the darkest night, with the train dashing along at the rate of 45 miles an hour, the trained engineer hears a slight sound which is out of the ordinary. He not only becomes aware of it by reason of hearing it, but if he were deaf as a post the disorder would be communicated to him through the medium of the throttle. He would feel a slight jar which would indicate as clearly as the sound that something was out of order, and, if the occasion warranted, a stop would be made at once or the matter would be attended to at the next station.—Philadelphia Record.

MYTHICAL SNAKES.—The cause of persons whose nerves are excited by protracted and excessive use of stimulants seeing the shapes of animals passing before them is not due wholly to imagination. In fact, the fancy only operates to induce a belief that what is seen is alive and hideous.

The eyeball is covered by a network of veins, ordinarily so small that they do not intrude themselves visibly in the path of the light that enters the sight, but in the course of some diseases these veins are frequently congested and swollen to such a size as to become visible, and when this happens the effect generally is to appear as if there were an object of considerable size at a distance from the eye.

Of course, this vein is generally long, thin and sinuous like a serpent, and the figure seen is frequently startlingly like a snake. That they seem to live is due to the fact that they are often not in perfect line with the direct front of sight. They are either to the side, up or down from the focus, therefore, when discovered, the victim naturally turns his eyes toward the effect, and the effect, of course, moves away.

The eye follows, and thus a continuous and realistic motion is got. Now, if the eye be turned to the front again quickly, it will see another snake, which, if watched will glide away in the same manner. The writer of this is afflicted by malarial disease, and after his eyes are thus congested many strange shapes and clouds pass within his vision, which, if he were in a state of nervous collapse, might easily be all that are seen by those suffering from delirium tremens.

MUCILAGE AS MEDICINE.—A correspondent sends us the following item: Mucilage is an excellent remedy for burns; apply it to the burn and lay on any soft blank paper. The mucilage soothes and the paper excludes the air. For corns there is nothing better than mucilage applied every night. It softens the corns so that they may be easily trimmed. A feverish patient will gratefully drink water in which gum arabic has been dissolved. The cooling draught may be flavored with lemon or orange.

LIMEWATER is an element not so much used as it would be if people realized its effect on the bones and teeth of growing children. When placed in milk, it adds a sweeter flavor even if no more than a teaspoonful is used to a tumbler of milk. It may also be used for indigestion. When the skin is broken out from poison oak, an excellent remedy is a solution of saltpetre. If strong, it causes pain when applied, but it subdues the poison.

Passing Events.

The miners' and farmers' committees are at work in Washington trying to get the River and Harbor Committee to pay due heed to the demands of the California Miners' Convention and River Improvement Convention. The Senators and Congressmen from this coast are helping them. The party in power which is trying to make a record for economy may not grant the appropriations asked for, but may grant a part at any rate. Still, we ought not to be disappointed if only a start is made this session. It is difficult, in a few weeks, to entirely rehabilitate an industry which has been closed for years. Everything thus far is favorable to the miner. Various bodies of prominence and financial weight have indorsed the miners' demands and added their influence. No such united action has ever before been taken by Californians in connection with this subject. The metropolitan and interior press have lent their aid in every way. Congress is being urged on all sides to act promptly. Something must come of all this. If it does not come at once, it will not be our fault; but it is pretty certain that in the end the influences brought to bear on Congress will bring success. It is the question of the day with the mining community of this State. The quartz miners are not being overlooked,

since the committees are alive to their interests also, and will bring forward certain mining law amendments favorable to the quartz and drift-mining industries.

Iron Ship-Building.

The Fearless, just completed by the Union Iron Works of this city for J. D. Spreckels & Bro., is the largest steel tug boat ever built in the United States. The new vessel is fully equipped with all modern appliances, including fire pumps, and during the trial trip on Saturday last acquitted herself in a very satisfactory manner.

Most people have come to a realizing sense of the great work accomplished by the Union Iron Works in bringing their ship-building plant to a point where they can build vessels of all classes for the U. S. Navy, but not every one understands how much ship work is being done in the mercantile marine branch. The repair work alone, at an important port like this, is very heavy. They have provided a first-class dry dock, heavy shears and everything necessary to take out large vessels, and to handle the heaviest boilers, etc. Until the Union Iron Works built their new plant, such facilities as these, at one point, were wanting at San Francisco.

Beginning with the coasting steamer Arago, the first metal vessel built on this coast, these works have continued to enlarge their plant and facilities steadily. Of course, their principal work has been on the Government cruisers. The San Francisco and Charleston are both in active service. The new cruiser No. 6 is plated as far up as the armor deck and will be soon ready for launching. The cruiser Monterey, is well advanced and ready for the armor plates. Work is also well advanced on the battleship Oregon.

A new steamer for the lighthouse service is almost ready to be launched, and work on the large steamer for the Pacific Mail Steamship Co. is going on rapidly. New boilers for the mail steamer Rio Janeiro will soon be put aboard.

The Union Iron Works people deserve great credit for having pushed this branch of work so to the front, that it has become the first in importance. Many predicted failure for the whole enterprise, as it was thought we could not compete with the East. Experience, however, shows that energy, intelligence and capital has won, and the Union Iron Works has earned a name for itself to be proud of. They now employ 1750 men. They are still enlarging their business, having, as stated last week, purchased the Pacific Iron Works, down town, where the mining machinery department will be carried on.

Comparative Cost of Working Ores.

The Granite Mountain Mining Co. of Montana yielded last year 85,471 tons of ore, at an average cost of mining of \$5.73 per ton. The three mills of the company crushed 72,622 tons (wet) of ore, or 68,850 tons (dry), and 10,807 tons (wet) of salt, or 10,645 tons (dry). The salt and ore were mixed before crushing. The cost of milling was \$10 per ton (dry).

The Dalmatia mine, El Dorado county, California, belonging to the American River Syndicate, an English corporation, handled at its mill 43,000 tons of rock in the 13 months from July, 1890, to August, 1891. Between the 1st of August and the 31st of December, the machinery dealt with 19,000 tons of ore. The gold was extracted at the average cost for mining and milling of 50 cents, or 2s 1d per ton. In October there were crushed 4448 tons, which were mined and milled at a total cost of 43 cents per ton. The mill is run by electricity, generated by water power, as described in the MINING AND SCIENTIFIC PRESS of Jan. 23, 1892. Most of the ore comes from an open surface cut.

But the cost of \$15.73 per ton for silver-

gold ore in Montana, against the cost of 43 cents for the gold ore in California, is sufficiently remarkable to be noted. Large quantities of ore are dealt with in each instance. It is no mere experimental matter, but every day work the year round.

It may perhaps be argued that such a comparison is unfair, as the methods of mining and milling are different in the instances noted. It is true that they are, but there is no such great difference as is shown in the comparative figures given. It is an argument in favor of gold-mining as carried on in California, that such cheap work can be done, since ore of very low grade may be worked at a profit and in large quantities. When such a great quantity of ore can be mined and milled at less than half a dollar a ton, the possibilities of the gold-mining of the present and future may be realized.

The Miners' Association.

The committee which went from this State to Washington on the debris matter are actively at work. They had one meeting in Senator Felton's room and one in Senator Stanford's room. Senator Felton, by the way, has sent all the copies obtainable of the engineers' report to California, and is actively aiding the business. Congressmen Camminetti and Geary are also assisting as much as possible.

Several of the counties are collecting money for the movement. Nevada county Supervisors have given \$1000, and the Miners' Association of the same county another \$1000.

The San Francisco Chamber of Commerce supports the movement heartily and has adopted suitable resolutions. The San Francisco Board of Trade has also taken an active part in both moral and financial support.

At a meeting of the Executive Committee of the Miners' Association held this week in this city, a committee was appointed consisting of Charles G. Yale (of the MINING AND SCIENTIFIC PRESS), A. Walrath and Thos. R. Church, to arrange for organizing a branch association in San Francisco county. The Finance Committee reported favorably in the matter of collections in this city.

El Dorado County Slates.

In December last, Melville Attwood, Esq., of this city, read before the California Academy of Sciences a brief paper on the California slates, exhibiting at the time several specimens from the Chili Bar slate quarry, El Dorado county. Mr. Attwood had made a microscopic investigation, and pronounced the slate having the characteristics described, and described the specimens which he exhibited as good as any in the world.

The only newspaper which published this paper of Mr. Attwood's, was the MINING AND SCIENTIFIC PRESS. The academy does not publish its proceedings for months after they occur, and as we recognized the fact that this opinion of the California slates, coming from an experienced geologist, microscopist and mining engineer, was very important, the paper was at once published in our columns.

Mr. Attwood's article attracted wide attention, and the quarries have been receiving a deluge of orders far beyond their present capacity to fill. The following letter on the subject is self-explanatory:

PLACERVILLE, Feb. 2, 1892.

Melville Attwood, Esq., San Francisco, Cal.—MY DEAR SIR: Since the publication of your paper of December, there are more orders for slate than ever, some mentioning the fact you stated about the quality. The Chili Bar Company cannot fill near all the orders, and some large orders are asked to be filled at \$8 per square, delivered at the R. R. depot at Placerville, but they cannot be filled at any price, as the slate cannot be got out. If some other company were operating, Chili Bar Co. would turn over \$12,000.00 worth of orders at this moment.

You will see what good your paper has done, as it is a fact that orders for 10,000 squares have been received that mention you or your paper. From the increase of orders and the impossibility to fill them, it looks like capital would invest in the slate grounds. Yours most truly,
GEORGE W. KIMBLE.

The California Building at Chicago.

At the meeting of the California World's Fair Commission, last week, a final choice was made from the 29 plans offered by the various architects, for the State building to be erected at Chicago. The design selected by the Commission as the best, was that submitted by A. Page Brown of this city.

It will be seen from the engraving, which we have prepared from Mr. Brown's drawings, that the style of the proposed building is that of the well-known "California Mission," with the arcade, Spanish roof garden and flat dome. When the old padres, headed by Junipero Serra, came wandering into this region from Spain and Mexico, their idea was to convert the Indians and incidentally take possession of their horses and lands. The Indians were gathered around the missions and had to settle down to work—this being called the first settlement of the State. Wherever the Mission fathers determined to stop, they put up these mission buildings, consisting of a church, with the necessary structures for residence, storage, etc. All the buildings were of the same general style, with broad, arched corridors and tiled roofs, the usual material being sun-burned adobe bricks, commonly whitewashed.

Mr. Brown has closely copied the best features of these old Mission buildings, maintaining the simplicity of detail which is a marked characteristic. These peculiar structures, many of which are still standing, are much admired by Eastern tourists, and in fact it remained for travelers to discover their picturesqueness and beauty, the old Californian seldom looking beyond utility in such matters. The buildings are very cool in the hot summer and comparatively warm in winter, the thick walls, wide and low, being also peculiarly adapted for a country where earthquakes are liable to occur.

The old Mission buildings have been so often described and figured in various publications that they are everywhere recognized as peculiar to California. It is therefore very appropriate that the California building at the World's Fair should be of this type. The only wonder is, however, that such good judgment should have prevailed, and something chosen so common here, but which will be an object of curiosity to visitors to the World's Fair. As a general proposition, we might have expected some ornate structure having nothing whatever to do with this State or its architectural history. As it is, the Commission may be congratulated on its excellent choice, and Mr. Brown also for confining himself to the peculiarities of the type, and carrying out his plans in such a skillful manner.

The extreme measurements of the building will be a length of 500 feet by a width of 110 feet. The total floor area will be 100,000 square feet, of which 60,000 feet will be on the ground floor. From the ground to the eaves will be 50 feet, and to the center line of the roof, 65 feet. The top of the dome will be about 80 feet high. The lower portion of the roof is to be covered with genuine Mexican tiles, and the upper portion, including the dome, with iron plates shaped like the tiles. It is intended that the walls shall be a close imitation of the adobe. Plenty of the well-known adobe soil of the State could be spared, of course, to build with after the Mexican fashion, but in the climate where the building is to be erected, the adobe could not very well be sun-dried in the way it is done here.

The main entrance of the building will be in the center, as the drawing shows, the various departments being arranged along the sides of the structure. The gallery will afford an area of about two-thirds that of the ground floor. The offices are to be grouped in the second story in such a way as to command from them a view of the whole interior. It is estimated that the cost of this building will be about \$75,000.

These plans will doubtless be accepted at once by the construction department of the World's Fair, and work on the building will be commenced as soon as possible.

A great deal more has been already done in preparing for the World's Fair than

ing, George B. Post, says of it: "Two of the vast machinery halls of the Paris Exposition could be wheeled through it, and the Auditorium, the building of which Chicago is most proud, could be pushed under its great roof, tower and all."

these buildings, many of which are in process of construction. There is good reason to believe that the California building will have its due share of attention; and when filled with the varied products of this great State, will attract numberless visitors whose

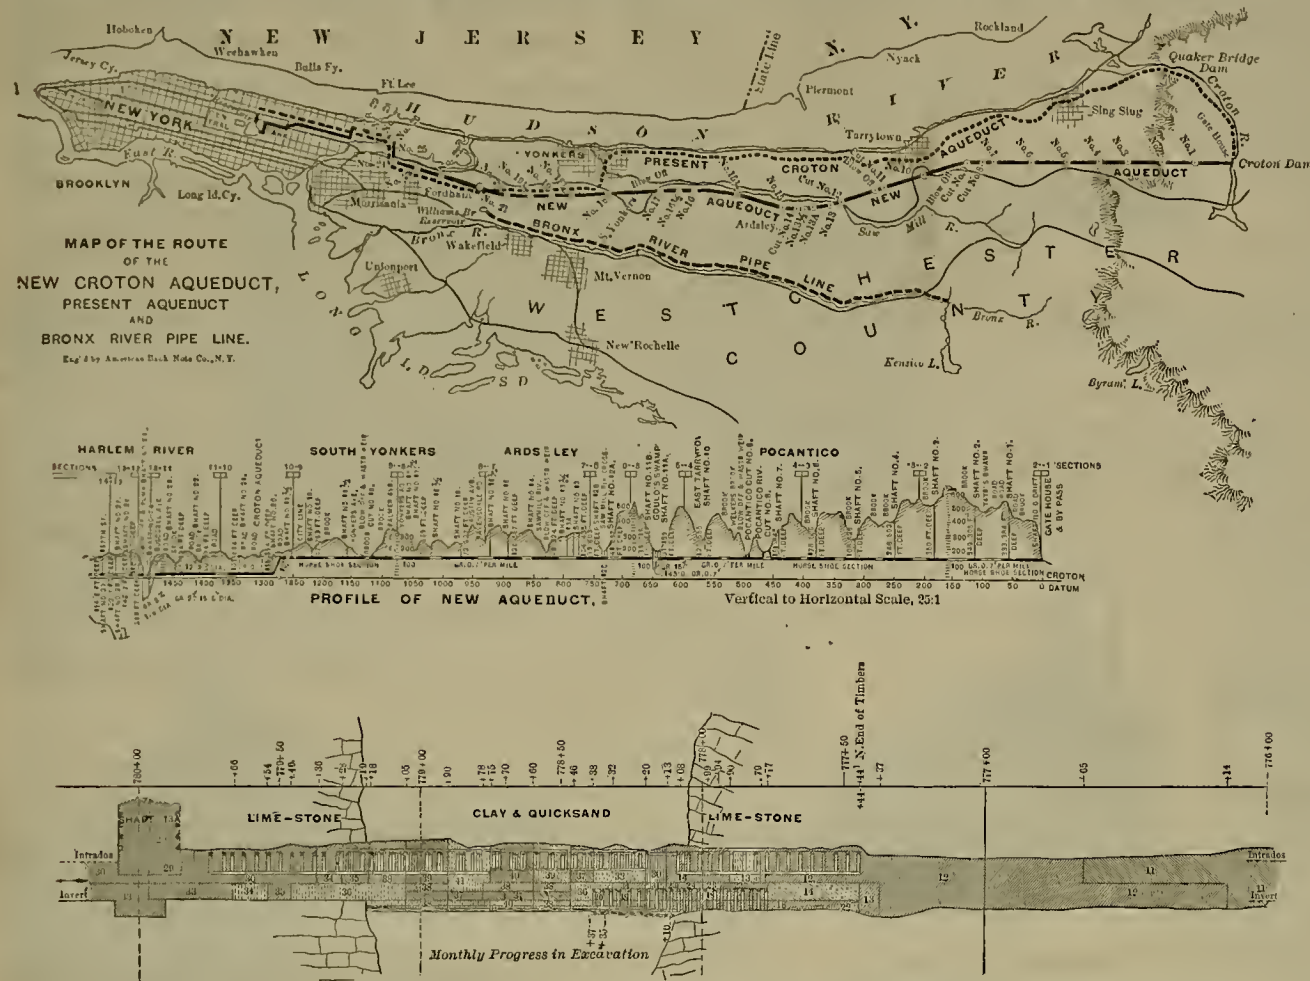

An Over-Ambitious Idea.

Such seems to us that involved in the proposition of the New Yorker that the silver in the United States Treasury, amounting to some 15,000 tons, be cast into plates, and with these a palace be built on the World's Fair grounds; said structure to cover an area of 600,000 square feet. Above this palace a tower is to be lifted to a height of 300 feet, the same to be surmounted by an image of the American eagle, with wings having a spread of 100 feet—all of solid silver.

Now, if by some ingenious contrivance the bird could be made to flop its wings and screech, as during the late Chilean unpleasantness, the spectacle would be complete and the effect produced calculated to duly impress the foreigners likely to collect at Chicago on this august occasion.

When it is considered that the cost of this gorgeous edifice will not exceed \$1,000,000, it is hardly to be expected that any American will object to such use of the white metal. Nothing like mixing with the useful and aesthetic a spice of the fantastic.

It being, however, often the case that such over-ambitious endeavor to inspire admiration excites only ridicule, it might after all be as well perhaps that this silver remain where it is, or, better, be coined into dollars having each the likeness of the great American eagle impressed upon it.

many persons imagine. Many of the buildings are in process of construction. The buildings themselves are in many varied styles of architecture. The Administration

The Agricultural building will cover nine acres and cost \$540,000. Its dimensions are to be 800 by 500 feet. All these buildings are well under way.

influence will in the end be of the greatest benefit to us.

JUDGE SAWYER'S ESTATE.—The ap-

THE CROTON AQUEDUCT.—In recent numbers of the PRESS, descriptions and engravings have been given of the methods of timbering adopted in the long tunnel of

CALIFORNIA'S BUILDING AT THE WORLD'S FAIR.

building alone will cost over half a million of dollars. It will be about 250 feet square and will consist of a central building, surmounted by a gilded dome of fine proportions and with large square pavilions at its corners. The edifice devoted to manufactures and liberal arts will be the largest of the kind ever constructed; it is to be 1688 feet long and 788 feet wide, covering in all about 31 acres. This will cost about one million dollars. The architect of this build-

The Art, Machinery, Electrical, Horticultural and U. S. Government buildings are all to be grouped about the basins and lagoons; that for Manufactures and Liberal Arts occupying the central position close to the lake shore. Outside of the circle a large space is reserved for the erection by foreign governments of buildings to illustrate the special features of those countries.

We have in previous numbers of the PRESS illustrated and described some of

praisers of the estate of Lorenzo Sawyer, deceased, made their report to the Probate Court this week. The total value of the estate is shown to be \$129,290.46. The estate consists of real property in San Francisco, Santa Barbara and Alameda counties, 300 shares of Pacific Gas and Improvement Co. capital stock, money on hand, law library and 100 shares of capital stock of the Commercial Bank of Tacoma, furniture, family portraits, etc.

the Croton aqueduct. On this page are given a map and a profile of the new aqueduct and a section showing monthly progress in excavation. The dimensions have been given in previous articles. The engravings will give a good idea of the extent of this great work.

THE directors of the W. Y. O. D. Mining Co., Nevada Co., have declared dividend No. 6 of 10 cents per share.

A New and Valuable American book for Prospectors and Miners.
JUST READY.

The Prospector's Field Book and Guide

In the Search for and the Easy Determination of Ores and other Useful Minerals. By Prof. H. S. Osborn, LL. D., author of "A Practical Manual of Minerals, Mines, and Mining." Illustrated by 44 engravings. 12mo, 175 pages. Price \$1.50, by mail, free of postage, to any address in the world.

CONTENTS.—Chapter I. Preparatory Instruction. II. Crystallography. III. Surveying. IV. Analyses of Ores, Wet Method, Dry Assay of Ores. V. Special Mineralogy, Gold. VI. Platinum, etc., Silver. VII. Copper, and How Measured by Ores. VIII. Lead and Tin. IX. Zinc, Iron. X. Mercury, Bismuth, Nickel, and Cobalt. XI. Aluminum, Antimony, Manganese, and other Minerals. XII. Precious Stones. Appendix, Correction of Weights and Measures, Prospector's Pointers, Index.

BY THE SAME AUTHOR.

Recently Published.

A PRACTICAL MANUAL OF MINERALS, MINES AND MINING.

Comprising suggestions as to the localities and associations of all the Useful Minerals; full descriptions of the most effective methods of both the qualitative and quantitative analyses of each of these minerals, and hints upon the various operations of mining, including architecture and construction. By Prof. H. S. Osborn, LL. D. Illustrated by 171 engravings. 8vo. 367 pages. Price \$4.50, by mail, free of postage to any address in the world.

Descriptive circulars giving the full tables of contents of the above books sent free to any one who will send his address.

A New List of Leading Books on Metal Mining, Metallurgy, Mineralogy, Assaying, Chemical Analysis, Geology, etc., sent free to any one, in any part of the world, who will send his address.

Our new and revised Catalogue of Practical and Scientific Books, 83 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Soot-burners, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.

Agents for the Morgan Crocker Co., Battersea, England. Also for E. G. Dennison's Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.

JOHN TAYLOR & CO.

Nevada Metallurgical Works.

NO. 23 STEVENSON STREET,

Near First and Market Streets, S. F.

C. A. LUCKHARDT, Manager. ESTABLISHED 1869

Ores worked by any Process.

Ores Sampled.

Assaying in all its Branches.

Analyses of Ores, Minerals, Waters, etc.

Working Tests (practical) Made.

Plans and Specifications, furnished for the most suitable Process for Working Ores.

Special attention paid to Examinations

Mines; Plans and Reports furnished.

C. A. LUCKHARDT & CO.,

(Formerly Huhn & Luckhardt,

Mining Engineers and Metallurgists.

GREAT REDUCTION!

BATTERY SCREENS.

Best and Cheapest in America.

PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Milling and Milling Machinery. Iron, Steel, Copper, Brass. Zinc and other metals punched for all uses.

Investor and Manufacturer of the celebrated Slot Out or burred and Slot Punched Screens.

Mining Screens a specialty, from No. 1 to 15 (fins).

Orders promptly attended to.

San Francisco Pioneer Screen Works,

221 & 223 First St., San Francisco, Cal.

JOHN W. QUICK, Proprietor.

The Best Mining District
On the Pacific Coast!

GRASS VALLEY, CAL.

THE BEST NEWSPAPER published in the district is

THE TIDINGS.

Daily and Weekly edition. Gives all the Mining News. Dealers in Mining Machinery and Mining Supplies will find THE TIDINGS the best medium for directly reaching the owners or managers of mines. Investors in mines will find it to their advantage to subscribe.

Many mines are in successful operation, and new enterprises are being instituted and many others are in contemplation.

DAILY, \$8 00 a year; WEEKLY, \$2.50, in advance.

H. S. SPAULDING, Publisher.

T. C. HOCKING, Editor.

226 Market St., N. E. cor. Front (up stairs), San Francisco
Experimental machinery and all kinds of models, tin and brasswork. All communications strictly confidential.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, February 18, 1892.

Although crop prospects continue favorable, yet the trade is not disposed to look on the bright side, and until we have passed well into the spring months conservatism will prevail. This spirit of conservatism has been grounded in business men by bitter experience that in this "glorious climate of California" nothing is more certain than the uncertain. This feeling is possibly giving way to the conviction that under tree and vine culture the climate is becoming more fixed in its character so far as concerns decimating north winds, drouth and similar evils. Iron manufacturers continue to report orders being received, and that, so far, everything points to an unusually prosperous season. Railroad building promises to assume large proportions. This opinion is based on the fact that two large railroad companies at the East have determined to construct to this city so as to have a Pacific ocean outlet. Their building into this State will cause more feeders to be constructed, and from this source alone more active times can be looked for.

The local money market is easy, although it is said that there is no great pressure to place funds. This condition will hardly change until after assessment day in next month. Considerable money, it is said, has been sent out of the State to avoid paying taxes. After assessment day these funds will more than likely be returned for investment.

MEXICAN DOLLARS—Shipments the past week aggregate \$204,927 to China and \$40,000 to Japan. The market is stronger at about 7 1/2 cts.

QUICKSILVER—Receipts the past week aggregate 253 flasks. The market is weak at quotations.

SILVER—The market has ruled strong at steadily advancing prices. The action of the market does not indicate that the upward movement is based on speculation, but rather on a legitimate demand in this country and in Europe. If the latter is the foundation on which rests the improvement, then it is quite probable that we will witness still higher prices. The Bland Silver bill is fairly before the House of Representatives, but no active debating is looked for yet awhile, perhaps not until the tariff bills are disposed of. It is quite generally conceded that the bill will be passed.

ANTIMONY—The market is lower, with a weak tone prevailing at the close.

BORAX—The market is essentially unchanged. Considerable is going forward to the East both by rail and water.

LIME—Receipts the past week aggregate 3606 hhls. There is a continued free demand for the Hawaiian Islands.

PIG IRON—Imports the past week aggregate 500 tons. The local market for spot and near-by parcels is unchanged. For shipment from England, prices begin to favor buyers, owing to lower outward freight asked by vessels for this port. The English market is reported strong, with a good demand ruling.

LEAD—The market is steady. Eastern advices report irregular, inactive markets. The fear of foreign importation is against sellers.

COPPER—The market, after hanging around \$10.60 in New York, is beginning to show more strength, with a slight advance established. London cables to Iron Age say: The copper market has been dull, with a fall of about 1 1/2 d. in prices of merchant bars. Depression has been emphasized by reports of financial trouble in Paris and adverse silver fluctuations, the two circumstances causing tired holders to realize, while the uncertainty restrains purchases for "long" account. Consumers are taking supplies very cautiously.

TIN—The market for both pig and plate is dull and heavy. Imported pig is quoted at about 21 cents and Temescal at about 20. The latter is said to be dirty, and therefore does not command full prices. Canners are reported as having their wants in plate well supplied, and their not being in the market, causes quotations to be more or less nominal.

COKE—Imports the past week aggregated 200 tons from Leith. Quotations are reported unchanged.

COAL—Imports the past week aggregate as follows: Leith, 1170 tons; Seattle, 4319; Nauaimo, 6025; Departure Bay, 2660. Total, 14,574 tons. Several changes are made in quotations for both steam and household coals. Blacksmith coal has been advanced several dollars a ton. This is due to prices heretofore ruling netting a loss instead of a profit to sellers. For shipment, English and Australian coals are quoted lower. The decline is undoubtedly due to favorable crop prospects on this coast, causing vessels to seek this port for wheat cargoes. Without some unforeseen unfavorable weather changes the wheat crop this year ought to go well up to 2,000,000 tons.

Ice-Making Machinery.

(Continued from page 129.)

is supplied by this steam, and then it is immediately used for conversion into ice. The extra amount needed is drawn from the boiler. Most machines are worked on such an extravagant system that their engines take more steam than is required for condensing water for ice-making. In the Hercules, the converse is the case. The ice thus made is perfectly pure.

A Hercules model ice plant is shown in one of the cuts printed herewith. An engraving is also given of the engine such as is used on steamships. For stationary work it is differently arranged in some respects. The engine is complete in itself, the power being transmitted to the compressor shaft from a crank placed on the extremity of the main shaft. All portions of the engine are built to standard gauges. The governor is of a very sensitive pattern. In the Hercules compressor, while still preserving the usual vertical position of the cylinders, by one of the simplest and most approved mechanical devices, the rotary motion of the engine is changed into the required reciprocating motion for driving the pumps, all parts being compact and rigid. The compression pumps and pump valves are peculiarly adapted to their special work, and the result of long experience.

One of the cuts shows the Hercules system, as applied to steamship refrigeration, with duplex machine, a double outfit combined in one. It refrigerates by use of the brine system. Should any accident occur, either side may be worked at a time. There are two compressors, two condensers and two sets of expansion coils. The Hercules ice and refrigerating machines are the embodiment of the most advanced knowledge on this subject, gained by the mastery of difficulties as they have presented themselves in actual work.

Eastern Metal Markets.

NEW YORK, Feb. 17.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday.....	10 1/2	89 1/2	10 7/8	4 05	19 60
Friday.....	10 1/2	89 1/2	10 7/8	4 05	19 60
Saturday.....	10 1/2	89 1/2	10 7/8	4 05	19 60
Monday.....	10 1/2	89 1/2	10 7/8	4 05	19 60
Tuesday.....	10 1/2	89 1/2	10 7/8	4 05	19 60
Wednesday.....	11 1/2	91 1/2	10 7/8	4 15	19 70

The metal market shows a stronger tone, with sellers generally asking slightly higher prices. Quicksilver is weak at lower quotations. Borax is steady.

Mining Share Market.

SAN FRANCISCO, Feb. 18, 1892.

Outside of continued activity in Hale and Norcross, mining shares have been more or less lifeless, with a gradual shading in prices. The activity in Hale and Norcross is due to the action of the "brokers' combine" forcing the stock pool and mill riots to the past week, yet the "chipping brigade," as the writer can see and learn from usually well-informed parties outside moneyed men are not interesting themselves in the share market, believing that any change in mine management from one set of Comstock managers to another set of Comstock managers is only a subterfuge, and which may result in handing outsiders from the frying pan into the fire. What is required is a complete change in the management of the mines, so as to have them worked to conform to the laws of California under which they are incorporated. Until this be done, and for which the "brokers' combine" is fighting, moneyed outsiders will continue to fight shy of the game that gives the bullion to insiders and assessments to outsiders.

Although Hale and Norcross sold at high prices the past week, yet the "chipping brigade," as the writer can see and learn from usually well-informed parties outside moneyed men are not interesting themselves in the share market, believing that any change in mine management from one set of Comstock managers to another set of Comstock managers is only a subterfuge, and which may result in handing outsiders from the frying pan into the fire. What is required is a complete change in the management of the mines, so as to have them worked to conform to the laws of California under which they are incorporated. Until this be done, and for which the "brokers' combine" is fighting, moneyed outsiders will continue to fight shy of the game that gives the bullion to insiders and assessments to outsiders.

A leading Philadelphia paper says "that John W. Mackay, of the Mackay-Bennett Cable Company, in connection with E. J. Matthews, of this city, and Marshall Field, of Field, Leiter & Co., Chicago, have been very active in Tractor (street cable) stock investments within a comparatively recent period. Other names of importance appear in this movement, but these are probably the most important." The Tractor stock covers the street cable roads in New York, Baltimore, Pittsburg and Chicago. The advance in prices has been quite decided. This deal probably keeps John W. Mackay in the East, but whether his presence here would help mining shares is rather problematic.

Outside mining shares continue flat, stale and unprofitable. The "Rszr Blades" made a sharp up-

Assessment Notices.

KEYSTONE CONSOLIDATED MINING COMPANY.
Location of principal place of business, San Francisco, California. Location of work, Amador City, Amador Co., Cal. Notice is hereby given that at a meeting of the Board of Directors, held on Saturday, the 30th day of January, 1892, an assessment (No. 2) of Two Dollars and Fifty Cents (\$2.50) per share, on the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, No. 310 Pine St. room 43, San Francisco, California.

Any stockholder who shall remain unpaid on the 7th day of March, 1892, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 28th day of March, 1892, to pay the delinquent assessment together with costs of advertising and expenses of sale.

By order of the Board of Directors
J. H. ISHAM, Secretary.

CALIFORNIA VERDE ANTIQUE MARBLE COMPANY.
Location of principal place of business, San Francisco, California. Location of works, Placer County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 21st day of February, 1892, an assessment (No. 1) of One Cent per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin, to the Secretary, at the office of the company, 335 Fifth Street, San Francisco, California.

Any stockholder who shall remain unpaid on the 7th day of March, 1892, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the eighth day of March, 1892, at the hour of two o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

By order of the Board of Directors.
W. J. GURNETT, Secretary.

Office, 308 Pine Street, San Francisco, California.

move, but fell back with equal celerity. The Bodie Mining continues to speak encouragingly of the Summit and Bulwer mines, but the shares in the two mines do not exhibit any life even at the low prices quoted.

From the Comstock mines there is uniformly good news from the Middle and North End groups, but the procrastinating character of the work is a dead weight to their shares. The battery assays of ore milled by Con Virginia, last week show a decided falling off, while those of Savage show a marked increase. There appears to be a growing impression that soon after the Savage assessment is delinquent, some of the very important secret work that has been done will be made public as something new, so as to get the public to buy more stock, which, if successful, would allow insiders to make the assessment. Belcher is taking out ore, which is being sent to the mill for reduction. The quantity of ore that is being taken out of Challenge and milled is not given, neither are the assays. Here is an opportunity to push a successful lawsuit. The water in the Gold Hill mines and Alta group of mines is being steadily lowered.

1860
INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class
Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal
nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original
cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies
the information accumulated through long and careful practice before the Office, and the frequent examination of
patents already granted, for the purpose of determining the patentability of inventions brought before us, enables
us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not
few. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S. F.

ELECTRIC BLASTING
VICTOR ELECTRIC PLATINUM FUSES.
Superior to all others for exploding any make of dynamite or
blasting powder. Each fuse folded separately and packed in
neat paper boxes of 50 each. All tested and warranted. Single
and double strength, with any length of wire.
VICTOR BLASTING MACHINE. Made in two
sizes. No. 2 fires 20 to 30 holes. No. 1 fires 5 to 8 holes. Adapted
for prospecting, stump blasting, quarry and general railroad work.
"PULL UP" BLASTING MACHINE. The
strongest and most powerful machine ever made for Electric
Blasting. No. 4 size fires 70 holes. No. 3 size fires 40 holes. Are
especially adapted for submarine blasting and large mining work.
Standard Electric Fuse and Blast Tester, Wire
Reels, new design, Lending and Connecting Wire.
— MANUFACTURED ONLY BY —
JAMES MACBETH & COMPANY,
125 Maiden Lane, New York City.
Send for Catalogue. PARKE & LAOY CO., San Francisco, Cal., AGENTS.

PLACER AMALGAMATORS
Combined with Steam Shovel or Dredge.
BUCYRUS SYSTEM.
NEW METHOD OF PLACER MINING.
Saves all the Gold. Uses very little Water. Treats large quantities at Low Cost.
— BUILT SOLELY BY THE —
BUCYRUS STEAM SHOVEL AND DREDGE COMPANY,
BUCYRUS, OHIO, U. S. A.

KROGH'S MINING HORSE-POWER HOIST
Is known to be
the best Horse-
Power Hoist
now made. It
is strong and
durable. The
drum will carry
1000 feet of five-
eighths steel
rope. It can be
used to run a
pump or blower
in conjunction
with hoisting.
Manufactured by
F. W. KROGH & CO., 51 BEALE ST., SAN FRANCISCO.

THE PELTON WATER WHEEL
GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 2000 IN ACTUAL USE.
Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running
from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be
produced from any other wheel in the country.
ELECTRIC TRANSMISSION.
The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close
regulation, and the facility of adaptation to varying conditions of speed and pressure, have
brought it into special prominence and extensive use for this class of work.
All applications should state amount and head of water, power required and for what purpose,
with approximate length of pipe line. SEND FOR CATALOGUE.

F. A. HUNTINGTON.

PATENT ORE FEEDER. CENTRIFUGAL ROLLER QUARTZ MILL.

This Feeder is especially designed to feed the Huntington Roller Quartz Mills; it is simple in construction, and while in motion can be easily adjusted to feed fast or slow; it has but few wearing parts and its positive movement makes it the best Ore Feeder now in use.

The Following will Explain the Above Cut:

The ore and water being fed into the mill at the hopper A, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

COMMON SENSE PULVERIZER AND CONCENTRATOR.

This is the Most Successful Machine yet discovered for working gravel, cement, clay, etc. It avoids crushing the rocks, which are washed clean, while at the same time it pulverizes the CEMENT or CLAY, and

SAVES THE GOLD ALTHOUGH IT IS AS FINE AS FLOUR.

It is only necessary to have from four to six inches of water to work 100 tons or more every 24 hours.

The machinery consists of two iron troughs or "concoaves," each 26 inches in diameter, one of which is about 18 and the other 12 feet long.

In these troughs are strong revolving shafts with projecting teeth, made of steel, two inches wide by three-quarters of an inch thick, placed in spiral form around the shaft, about two inches apart, forming a conveyor.

The first shaft is arranged to revolve from 150 to 250 revolutions per minute, and the second one from 300 to 600.

There is a revolving screen between the two troughs that takes out the coarser rocks after being washed, and only the finer material runs into the second trough, and is there worked thoroughly.

There is a space of about four inches in the bottom of each trough, or "concoave," that fills up with gravel and sand. When the gold is freed it settles into this, and as the teeth do not disturb the bottom, the gold remains there until a cleanup is made.

VALLEY SPRING, CALAVERAS CO., CAL., July 19, 1890.
Mr. S. K. SNODGRASS—Dear Sir: We find your machine perfectly reliable for four to five tons per hour, according to size of gravel. The work is well done, and not to exceed five per cent gets by, which I believe is very close work for any machine.
Yours,
L. A. SHEAR.

BURSON, CALAVERAS CO., CAL., JULY 3, 1890.
S. K. SNODGRASS—Dear Sir: I have seen the Common Sense Pulverizer and Concentrator in operation, and will say that for all kinds of gravel and clay it is the best machine I have ever seen.
Yours respectfully,
A. J. KNAPE.
Miner for 25 years.

PLACERVILLE, CAL., July 15, 1890.
S. K. SNODGRASS—Dear Sir: I have worked with your machine in two counties, and have never seen the equal of it for washing gravel or saving fine gold. I have helped to clean up and found fine flour gold. I have put through it at the rate of 100 tons and over per day, and have also prospected the tailings thoroughly and found no gold in them. I have talked with other parties who have worked with them and say they are a good machine. I have been mining over 25 years.
Very respectfully,
D. G. HUOHES.

VALLEY SPRING, CAL., June 30, 1890.
S. K. SNODGRASS—Dear Sir: I have seen the working of the Common Sense Pulverizer and Concentrator in clay and all kinds of cement, and have examined the tailings, and will state that I have never seen work done by any machine that compares with it. I have seen it when working from 100 to 150 tons per day, and been present when cleanings were made, and seen gold as fine as flour. I would recommend it for using in any kind of placer mining. I have been mining for 20 years.
Yours,
J. D. COOK.

SAN FRANCISCO, March 25, 1891.
S. K. SNODGRASS, Esq.—Dear Sir: In regard to the work done by your machine, which we have had in operation for the past three months, I can say that it has handled successfully all material as taken out of our ground, the only cement which was not perfectly broken up being an exceedingly hard cemented material approaching rock in its hardness.

For all free wash and moderately hard cement it will do very good work, and must effect a great saving in working such gravels and cements, owing to the small head of water required; and furthermore, its great gold-saving qualities, as I am satisfied that fully 95 to 98 per cent of the gold freed in the machine is saved, even to flour gold, and that too without the use of quicksilver.

The automatic rejection of all rocks and material by the revolving screen makes the handling of the gravel cheaper, as all hand culling of the material is rendered unnecessary.
Yours truly,
W. W. B. STEVENS.

CHILI GULCH, CALAVERAS CO., CAL., July 16, 1891.
Mr. SNODGRASS—Dear Sir: I was down to Spring Valley looking at the machine and it runs very nice and a great deal better than I expected. If you can make them work as well as that one it is the finest machine in the country, and I examined it thoroughly. I have been around gravel mines for the last 30 years.
Yours respectfully,
STEPHEN M. HUOHES.

S. K. SNODGRASS,
ROOM 13,
220 SUTTER ST., SAN FRANCISCO.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frues" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frues" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt . . . \$650 f.o.b.
Price "Triumph" Concentrators, with Plain Belt . . . \$550 f.o.b.

(PATENTED.)
Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Orass Valley, Nevada Co., Cal.
ORASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.
At the Tea (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices.
Signed] Sup't North Star and Original Empire Mining Co.
N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen.
First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will save a higher percentage of sulphurets.
H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

Manufactured under Patents of April 27, 1880;
September 18, 1883; July 24, 1888;
and March 31, 1891.

Price of Plain Belt Frue Vanner, \$575, f. o. b.

Price of Improved Belt Frue Vanner, \$825, f. o. b.

Mining Matters and Congress.

Although it was supposed by some that the committees from the State Miners' Convention and the River Improvement Convention would accomplish little in Washington, the progress so far made is very good indeed. The joint resolution introduced by Congressman Camminetti of this State has passed both houses, been signed by the Speaker of the House and President of the Senate and gone to the President of the United States for signature. This joint resolution is published in full on page 146 of this number of the PRESS. The Secretary of War is asked to furnish at once estimates of the amounts required which can be spent profitably this year on restraining works for holding back mining debris from the rivers.

The memorial adopted by the State Miners' Convention and indorsed by the representatives of the farming interests has been presented to the Senate and referred to the Committee on Commerce. Senator Felton secured from Senator Frye a promise that the miners' and farmers' commission would have a full hearing before the Committee on Commerce at an early date.

The report that Senator Felton was not taking an interest in the miners' cause is incorrect. Messrs. Searles, Luttrell and Hobson have telegraphed that Senator Felton is using every effort in their favor and believes they will have success.

In fact the whole California delegation has been spurred to unusual effort by the presence of the committees from the conventions of this State. Their presence has shown that the people here are in earnest. The Board of Supervisors, the Chambers of Commerce and the Board of Trade of San Francisco have all passed favorable resolutions which have been forwarded to Washington and will materially assist the efforts of the Congressmen, Senators and Committees.

Altogether the outlook is even more favorable than was expected, and the mining men have reason to be pleased with it.

Electric Mining Machinery.

Electric machinery for mining purposes is being rapidly increased in variety and form. For underground work it possesses several advantages evident to any miner. For surface work also, as in mills and hoists it is rapidly coming into use. One of the engravings on this page shows the Webster, Camp & Lane hoist, equipped with a motor for use in the Ashland iron mine, Ironwood, Michigan. This cut is taken from Mr. Spaulding's paper on "Electric Power Transmission in Mining Operations," quoted several times of late in our columns.

The other engraving shows a large

electric mining pump. The motor takes the place of the usual steam cylinders as shown, and the power to drive it may be

STOP ILLEGAL MINING.—The Executive Committee of the Nevada County Miners' Association has heartily indorsed the reso-

A San Francisco Miners Association.

To still further assist in the firm establishment of the California Miners' Association, a branch was organized in this city on Tuesday, similar to the other county associations. Mr. Louis Glass called the meeting to order. Chas. G. Yale stated that the object of the meeting was to perfect a county organization of mining men and those interested in the mining industry. A very large amount of San Francisco money was invested in mining property in California, and it was proper that the miners' movement should be heartily supported by our citizens. There should be a membership of several thousand in the county associations which it was proposed to establish. The Committee from the California Miners' Association, consisting of Messrs. Yale, Walrath and Church, who were appointed to organize this local branch suggested a list of names for officers, which was read by Secretary Ralston as follows:

President, Robert McMurray; First Vice-President, J. O. Whitney; Second Vice-President, Robert Watt; Third Vice-President, A. J. Bowie; Fourth Vice-President, G. W. Grayson; Fifth Vice-President, John Taylor; Secretary, Charles G. Yale (of the MINING AND SCIENTIFIC PRESS) Treasurer, The California Safe Deposit and Trust Company; Executive Committee—A. Walrath, I. C. Stump, W. C. Ralston, Thomas R. Church, F. Chappellet, G. H. Sanderson, S. K. Thornton, Robert Sherwood, William Irelan Jr., W. Steinhart, Thomas Price,

James G. Fair, Thomas Bell, H. Pichoir, A. J. Ralston, S. J. Hendy, B. T. Lacy, Charles S. Wieland, J. L. Flood and S. K. Firth. The gentlemen chosen were unanimously elected to fill the various offices.

President Robert McMurray then took the chair. Resolutions were passed that the constitution and by-laws of the State Miners' Association be adopted for the new organization, saving the change of name to "The Miners' Association of the City and County of San Francisco." Messrs. Glass, Yale and W. C. Ralston were appointed a committee to draft the by-laws and constitution.

A certificate of organization was then drawn up and signed by those present, and the committee above named was also appointed to canvass the city and obtain as many members as possible.

The telegram from Washington stating that the report that Senator Felton was working against the miners was incorrect, but on the contrary he was supporting them, and the dispatch stating that the House had passed the suggested resolution concerning mining debris in California, were read and received with enthusiasm.

ELECTRIC MINING HOIST.

A MINING PUMP DRIVEN BY ELECTRIC MOTOR.

generated at the surface and conveyed down the shaft by the electric wires. The mechanism for converting the rotary into reciprocating motion is not complex.

lutions of the California Miners' Association with respect to hydraulic miners desisting from operations until Congress can act on the engineers' reports.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Ed.

The Comstock Situation.

SAN FRANCISCO, Feb. 19, 1892.

TO THE EDITOR:—We beg to congratulate you on your editorial in the PRESS of Feb. 13th on the Comstock situation. We have known that at all times you were on the side of right and justice, and that with the proper demonstration and proof to you, that you would support us in the fight we have been, and are now, making against the combination that is pillaging the stockholders and looting the mines of the Comstock lode. Never in recorded history has there been such a complete system for the despoliation of trust property as has been put in force by those in control of the mines and mills of that lode. It may be condensed to the following:

1st. The incorporation of the various properties under the laws of the State of California.

2d. The obtaining and retaining control of these properties through the nefarious proxy system of the State of California.

3d. The election of dummy directors of the various corporations who, as has been proven in the Hale & Norcross suit, know nothing of the working of the mine or assist the rascally mill owners to rob the mines for a portion of the plunder.

4th. The milling of the ores from these mines in mills belonging to companies incorporated under the laws of the State of Nevada.

It was a master mind that originated the plan under which this rascality is practiced, and his followers in iniquity are none of those so proficient in the art as the Mephistopheles who worked out the plan of spoliation now practiced. To tell the truth, they are petty larcenists compared to him.

That you may better realize the profitable nature of the calling of these petty larceny mining millionaires, we quote you from the testimony of D. B. Lyman, superintendent of the Consolidated California & Virginia Mining Co., given in the Hale & Norcross case yesterday, under cross examination by W. T. Baggett, attorney for plaintiff. The following was developed:

Q. If 1259 tons of ore, car sample assay value of \$72.12 per ton, total value \$113,518.41, was sent to the mill, and the milling company only returned \$40,471.50, would you consider that ore properly milled?

A. Assuming everything correct, I would not.

(Objection being made to style of question, Mr. Baggett put next as follows:)

Q. If you owned the Hale & Norcross mine, and you shipped 4579 tons of ore, value at the mine car sample assay \$48.33, total value \$221,303.07, to the mill, and the mill returned you \$90,535.12, would you be satisfied with that return?

A. No.

Q. If you sent 3973 tons, car sample assay value \$222,711.30, and the mill returned \$78,097.77, would that be satisfactory?

A. No.

Q. How much would you expect from that ore?

A. I would have expected at least 65 per cent of the car sample assay value.

These figures represent the shipments of the ore of the Hale & Norcross Mining Co. as follows:

December, 1887, 4579 tons	\$221,303.07
February, 1889, 1259 tons	113,518.41
April, 1889, 3973 tons	222,711.30

Value car sample assays\$557,532.78

According to the testimony of Lyman, who was introduced by the defense as an expert, the company should have received 65 per cent of this amount, which would amount to \$362,396.30. According to the records of the Hale & Norcross Co., they received as follows:

December, 1887	\$90,535.12
February, 1889	40,471.50
April, 1889	78,097.77

Total\$209,104.39

This shows a loss of \$153,291.91, which was stolen from the Hale & Norcross Mining Co. during the three months mentioned by the thieves who own the mills that crushed the rock. Is it astonishing that under such circumstances the mining interests and the stock business have gone to ruin? The figures given are all taken from the records, and we have plenty more of the same kind at your disposal and for your information.

You are right when you say these conspirators should be in the penitentiary. They have posed long enough as millionaires, and should take their places as felons where they belong.

J. H. TINGMAN, Sec'y
Mining Stock Association.

An Old Suggestion for a Convention.

SAN FRANCISCO, February 18, 1892.

TO THE EDITOR:—On the 18th day of February, 1884, just eight years ago to-day, while connected with the State Mining Bureau, I received a letter from Mr. John Hemsley, a well-known Placer county miner, to which I was expected to reply officially.

I had recently returned from a very careful reconnaissance of the hydraulic mining region, and the low lying lands injured by the mining debris, and had given the subject much careful consideration.

In answering Mr. Hemsley's communication, I took occasion to express my honest convictions; bearing in mind that the office I held was established for the express purpose of furnishing information to the miner, my reply was carefully written.

My letter proved an offence to the agriculturists. I wrote:

If the production of gold and silver in California should cease to-day, ours would still be a great and prosperous State as New York is now, but there would follow a period of depression which would probably last for years, until our people acquired new habits of economy and industry. To suddenly stop any great industry, would react against all classes.

But the greatest offense I innocently committed, was to propose a convention of miners and farmers and an appeal to the Federal Government, in the following words:

I am of the opinion that a convention of miners and agriculturists should be called to discuss this question, and to devise plans to overcome the undisputed inconvenience and injury to the farmers caused by hydraulic mining. It is my present opinion that the General Government should step in and aid in the settlement of this most important question in which all the people are interested. The gold of California was an important factor in the hands of the Government during the time of sore adversity of the nation, and would be again under similar circumstances. The whole country should give this matter attention, for it is a national question. What takes place in California must follow in time in other States and Territories, for which reason it is my opinion that the serious attention of Congress should be called to the subject by the people of California, and that body be asked to appoint a commission to investigate and suggest some relief for the troubles, both of the miner and the agriculturist, which have become very serious.

Why there should be any objection to this proposal I could never understand, as it seemed to me the most reasonable and sensible thing for men to do. I have often since questioned in my own mind whether I was really deserving of censure in proposing what has recently been done. If I have ever been sincere in anything, it is my friendship for the miners of California.

Some of the valley papers, impugning my motives, made my letter a personal grievance. The *Daily Appeal* of April 2 was pleased to say:

Henry G. Hanks, State Mineralogist, has published a long and useless article in defense of hydraulic mining, in which he not only promulgates the most extravagant views in regard to the necessity of gold production in California, but manifests the impudence to suggest a convention of the farmers and miners to discuss a compromise. We say this is impudence; it is certainly the coolest kind of a proposition to ask farmers to meet hydraulic miners for the purpose of discussing a compromise, when any character of a compromise would be nothing less than an unconditional surrender of the Sacramento valley to hydraulic mining for dumps. He may induce some over confident hydraulic miners to call a convention, but no one will attend but miners. * * * The hydraulic man who talks about compromises when slickens rises about the farmer's neck, is a debris Bourbon of the worst kind.

The *Daily Bee* of March 31 published the following:

Mr. Hanks gives no answer to the question relative to drift-mining, but suggests that a convention of farmers and miners be called to discuss the question and devise plans to overcome the undisputed inconvenience and injury caused by hydraulic mining. This is an old suggestion and one that has often been made and rejected. Any convention of this kind is wholly impracticable; it could only result in nothing, and if it could reach any conclusions, nobody would be bound by its act.

The *Sutter County Farmer* of April 4, devoted considerable space to the utter condemnation of the letter in full, from which the following are extracts:

He advises the holding of a convention of farmers and miners to patch up a compromise. * * * He also wants a Congressional commission. What for? Is it to turn the monitors loose upon an offending people? This we think is implied in the scheme. * * * In conclusion, he explains himself under nine different divisions, all of which are fallacious, and one of which is actually wicked. Here is one: Seventh.—There are large tracts of land in California which can be used for agriculture, where no mining is likely to interfere. To make plain what is meant read: Eighth.—The area on which placer gold can be profitably mined is limited. This language is susceptible of but one construction: it means a surrender of the Sacramento valley to the uses and requirements of the hydraulic miner.

This editorial concludes thus: Professor Hanks, State Mineralogist, henceforth is clearly entitled to the credit of having uttered the most atrocious sentiments yet written, and brands him as an enemy of law, order and civilization.

I do not quote these criticisms in malice,

but as a matter of history. I felt hurt at the time, knowing that the strictures were unjust, but I have had the satisfaction of noting a gradual change of sentiment, and an awakening of the people to a sense of the true interests of the State.

Early in 1888, Congress passed a bill appropriating \$10,000, and detailing three officers of the Engineer Corps of the United States army "to make a thorough examination and investigation of the mining debris question in California." In December of the same year, the commission established headquarters in San Francisco and commenced operations. Their report and those of others who had examined the Bay of San Francisco and the California rivers, proved that I was not wholly in error when I wrote, "It is not fair to charge the miners with the total filling up of the rivers, which is an operation ever going on," etc., etc.

I have not changed my opinion as to the policy of taking out all the gold we can, and while we can. I do not disparage the farming interests, but it is still my belief that we cannot maintain the highest condition of prosperity in California by agriculture alone.

Since gold-mining has been restricted, and in some cases interdicted, there has been a proportional depression which miners have found hard to bear. The farmers, too, have felt this depression, and are also incommoded by scarcity of money. Crops are large, but the market is limited, and they are sometimes compelled to part with their products at a price which leaves but little margin for the labor and investment. I do not attribute this wholly to a reduced output of gold, but I am convinced it is partially the cause.

The former almost phenomenal prosperity of California will return when we become, as we may, an agricultural, mining, manufacturing and commercial community. All the resources of the State should be fostered and cherished. When the mining convention was called, I felt that a new era was about to be inaugurated; I watched the progress of events with great interest. But when, on the 20th day of January, the editor of the *Sacramento Bee* made his admirable address, using the words, "We have come down to say to you that we want to bridge over the chasm," I began to think the millennium was at hand. I was reminded of the fact that the American people decide in favor of the right if time enough is given to them, and while I regret the loss of time, and feuds of the past, I am prepared to say with Shakespeare, "All's well that ends well."

HENRY G. HANKS.

The New Reservoir.

Secretary Englebright informs the *Union* that the work of constructing the company's new reservoir on the South Yuba, above Bear Valley, is to be resumed this season and carried to completion, but it will probably be the 1st of June before active operations can be commenced, as at the present time the snow is about six feet deep in that country. The dam was built about one-half the height it was intended to be last season, and when completed it will hold sufficient water to cover 200 acres of ground. Last season the company reopened and repaired the old ditch from Bear Valley to Gold Run, which had been out of use for a number of years, and this season this ditch is to be extended as far down the divide between Bear river and the north fork of the American as Colfax, in order to furnish water for irrigation. Another year the line will be extended below Colfax and to a connection with the company's Bear River and Auburn canal, and by this means a good system of canals will be perfected reaching from the mountains to the lower portion of Placer, and into Sacramento county.

THE GEOLOGICAL SURVEY.—Some weeks ago it was announced that the Cuvier annual prize of 1500 francs for the greatest scientific service done to the world during the past year had been voted to the United States Geological Survey by the French Academy. Major Powell of the Survey returned the money in a letter, saying that such prizes ought to go to meritorious individuals rather than to Governments or Governmental institutions. He asked the Academy to send a gold medal instead, and to add the unexpended balance of the prize to the next annual premium to be awarded. Major Powell has just received a letter from the Secretary of the Academy, M. Daubrie, stating that a commemorative medal would at once be struck, and expressing the hearty thanks of the Academy for the suggestion, which betokens the cosmopolitan generosity, as well as the enlightenment of the Bureau. M. Daubrie remarks incidentally that no region of the globe has witnessed such scientific discoveries within the last 25 years as have been made in the United States.

Mining Matters in Congress.

Debris in California.

Representative Caminetti on the 1st inst. introduced in the House of Representatives the following measures:

House Resolution No. 78—Read twice, referred to the Committee on Mines and Mining. Joint Resolution, concerning mining debris in California, and requesting certain estimates from the Secretary of War.

WHEREAS, Under the provisions of an Act, approved October 1, 1888, a Commission, composed of members of the Engineer Corps of the United States Army, was appointed to investigate the mining debris question in California; and, whereas, said Commission devoted a great deal of time to the examination of the country and rivers affected, and in gathering data to enable it to report a plan of action; and, whereas, the report of said Commission has been submitted through the Secretary of War, and among other recommendations therein appears the following: "It is proposed to improve the rivers, first, by restraining the debris now lodged in the canyons of the Yuba and Bear, and in the plains below, by dams and other restraining works; second, by contracting the widths of the rivers by brush wing dams in their beds. The estimated cost of these improvements is: Feather river wing dams, \$300,000; Sacramento river wing dams, \$300,000; dam on Yuba river at De Guerre Point, according to height, from \$300,000 to \$640,000; dam in Bear river at Van Giessens, \$150,000; restriction works on Yuba river below foothills, \$300,000"; and, whereas, notwithstanding that said report absolutely shows the existence of "vast deposits of material lying in the canyons and in the plains below the foothills, portions of which will be carried down during floods and eventually lodge in the streams," no estimate was made by the Chief of Engineers to commence that system of improvement required to restrain the mining debris where now lodged; and, whereas, it seems from said report to be a necessity so to do without delay in order to prevent its final lodgment in the navigable streams, causing incalculable damage, and also in order to make effective the expenditure of money in improving the Sacramento and Feather rivers; therefore be it

Resolved, By the Senate and House of Representatives of the United States of America in Congress assembled, that the Secretary of War be, and he is hereby, requested to submit for the consideration of Congress such further estimate of the amounts required, and which can be spent profitably during the coming year, in making the improvements recommended by said Commission to restrain said mining debris and prevent its lodgment in the navigable rivers.

A DEPARTMENT OF MINES AND MINING.

House Resolution No. 5161—Read twice, referred to the Committee on Mines and Mining. A bill to create an Executive Department of Mines and Mining.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled: That there shall be at the seat of Government an Executive Department to be known as the "Department of Mines and Mining," the general design and duties of which shall be to acquire, by examination, practical and scientific experiments, geological research, or otherwise, useful information on subjects connected with mining in the general and comprehensive sense of the word, and to diffuse same among the people of the United States.

SEC. 2. That said department shall be under the supervision of a Secretary of Mines and Mining, who shall be appointed by the President, by and with the consent of the Senate; and Section 158 of the Revised Statutes is hereby amended to include such department, and the provisions of title four of said Revised Statutes, including all amendments thereto, are hereby made applicable to said department.

SEC. 3. That there shall be in said department an Assistant Secretary of Mines and Mining, to be appointed by the President, by and with the advice and consent of the Senate, who shall perform such duties as may be required by law, or prescribed by the Secretary thereof.

SEC. 4. That the Secretary of Mines and Mining shall receive the same salary as is paid the Secretary of each of the Executive Departments, and the salary of the Assistant Secretary of Mines and Mining shall be the same as that now paid to the First Assistant Secretary of the Department of the Interior.

SEC. 5. That the duties now imposed by all laws and parts of laws relating to mines

and mining affairs exclusively, upon any existing department of the Government, or any division or bureau thereof, shall, on and after the day this Act takes effect, be performed by the Department of Mines and Mining.

SEC. 6. That the Geological Survey and the Bureau of the Mint are hereby transferred to the Department of Mines and Mining.

SEC. 7. That the sale of the mineral lands of the United States shall be conducted under the auspices of the Department of Mines and Mining.

SEC. 8. That on the organization of this department, all officers and employees wholly engaged in official work in any department of the Government, or any division or bureau thereof engaged in the performance of the duties referred to in Section 5 of this Act, and all such employed in the departments referred to in Sections 6 and 7 hereof, shall be transferred to the Department of Mines and Mining.

SEC. 9. That all records, maps, documents, instruments, surveys, machinery and other materials now in the possession and use of any existing department of the Government, or any division or bureau thereof referred to in Sections 5, 6 and 7 of this Act, are transferred to the Department of Mines and Mining.

SEC. 10. That this Act shall go into effect on the 4th day of March, 1893.

Oil Wells at Puente.

The question of cheap fuel seems likely to meet with a speedy solution from more sources than one, says the *Pomona Progress*. We recently published an account of a rich find of brea in the hills near Los Angeles, that is said to be of such a quality as to make excellent and inexpensive fuel. Then, too, the San Antonio Electric Light and Power companies and other electric companies that are being organized in different places, expect to furnish power cheaper than it can be obtained by the use of fuel. In addition to all this, there seems to be an inexhaustible supply of oil in the hills south and west of this place.

Members of the oil firm of Chandler & Fonda say in regard to the Puente oil field: "We have two oil wells on our land which is in the Puente hills. One well we have down 675 feet and is in an 8-barrel well. The other well is down 400 feet and is not yet on the oil contact. An 8-barrel will net a profit of about 15 barrels per day. All our oil is taken by the Whittier school. We own about a mile of land along the oil belt, and there are thousands of tons of asphaltum in sight. We get \$2.25 per barrel for the oil and sell all we can get up. The demand is greater than the supply. Three barrels of oil is equal to a ton of coal, and I predict the time will come when oil can be put on the market in Los Angeles for \$1 per barrel. This will make the value of a ton of coal in Los Angeles \$3, and it will solve the fuel question so far as manufactures are concerned.

"The hills of Puente are reeking with oil. Such a thing as a dry well has never been known. There are 22 wells in that belt now. One who has not visited those hills has no idea of the quantity of oil there is in them, even appearing upon the surface. One of our boys last week dug a hole 30 inches deep with a pick and shovel. He extended it into a little trench, laid a pipe in and put a 5-gallon can under the pipe at the end. In six days he got 35 gallons of oil. Years ago, prospectors were looking over that ground, and seeing this asphalt, thought it was coal. They sunk a number of shafts four feet square all over the hills, and after they had got down 10 or 15 feet and found nothing but this black oil, they gave up the job. Many of those black holes have been there 10 years, and I'll wager you will find as high as 20 barrels of oil in many of them. Three or four wells can be worked as cheaply as one well. What is needed is capital. If those hills were in the East, all the money necessary to develop the oil could be raised without difficulty, but it is not so in California. Los Angeles need never worry over the fuel problem. Just as soon as fuel is wanted, it can be had right at our doors, the cleanest, cheapest fuel in existence, except natural gas."

PLACERS.—A dispatch from Tucson, A. T., dated Feb. 18th, says: To-day one of the biggest gold nuggets ever seen here was brought to Tucson. A week ago a Mexican, while walking along the placer diggings at Quijotoa, which had been washed out by the late rains, saw the gold—a dingy yellow lump—sticking out of the sand and kicked it loose. The value of it is about \$200. It weighs 11 ounces. Smaller nuggets were also found.

An Important Mining Decision.

The following decision of the Secretary of the Interior regarding the legality of relocating mining claims is of great importance to many. By this is shown that every proof can be made and filed, but if there is failure upon the part of the applicants for patent to pay the amount due the Government, then all assessment work must be done the same as if no application for patent had been made, otherwise the claim is open to relocation. Secretary Noble says:

On the 12th of June, 1884, the Belyoir Mill and Mining Company, a corporation, filed in the local Land Office at Sacramento, California, its application for patent for the Belyoir lode and mill site, lots 61 A & B, in T. 12 N., R. 8 E., being mineral application No. 1410, and furnished all the evidence necessary to entitle it to make final entry.

On the 2d of April, 1889, Luke Ferguson, the plaintiff in this case, filed with the Recorder of Placer County, California, the county in which the claim is situated, a notice of location of the Boulder lode claim, which, in effect, is a relocation of the Belyoir lode claim.

On the 21st of May, 1889, he applied to the local office for a hearing to determine the truth of his allegations that the company had abandoned its claim, and had failed to do the required assessment work thereon for over two years, and he asked for the cancellation of its application for patent. The local officers thereupon ordered a hearing to determine whether or not the said company, by failure to comply with the law, had abandoned its claim under its application for patent, and whether Ferguson was entitled to make entry as a relocater.

After the taking of considerable testimony at the hearing, and after the contestant had closed his case, the company made a verified application for a continuance, and for a commission to take the testimony of certain absent and material witnesses. The continuance was granted, but not the commission, and from the refusal of the local officers to grant the commission the company sought to appeal to your office. The local officers held that their order denying the commission was interlocutory, and no appeal could be taken therefrom, but consented to forward the application for a commission, and the attempted appeal from their decision thereon, to your office for consideration.

When the date to which the case was continued arrived, the contestant appeared with additional witnesses. The company protested against the allowance of any additional testimony during the pendency of its appeal to your office, from the decision of the local officers refusing its application for a commission. The local officers overruled such protest, heard the testimony offered by the contestant, and on the 10th of December, 1889, united in a decision holding that mineral application 1410 should be canceled.

From this decision an appeal was taken to your office, and the record in the case was received by you on the 13th of February, 1890. After examining it, you decided that the local officers erred in denying the company's application for a commission, and without considering the case upon its merits, you returned the record to the local office on the 28th of March, 1890, with instructions to those officers to issue a commission to some competent and suitable person in San Francisco to take the depositions of the witnesses named, and to render their decision upon the completed record, and report to you as required by the regulations.

These instructions were complied with, and on the 9th of June, 1890, the register and receiver rendered their second decision in the case, in which they reached the same conclusion as in their first, and held "that mineral application 1410 be canceled." From that decision an appeal was taken to your office, and on the 18th of October, 1890, you affirmed the same. A further appeal brings the case to this Department for consideration.

The evidence in this case presents several peculiar and unusual features. A company which had expended between 20 and 40 thousand dollars in developing its mine and carrying on its business, failed to make the payment of \$65, which should have accompanied its application for a patent. When it was discovered that this payment had not been made, the amount was tendered to the local officers, who declined to accept it on account of an intervening adverse claim. Under the belief that this entry had been completed, the company suspended its underground mining operations in Decem-

ber, 1886, and shut down its mill in February, 1887, for the reason that it was not capable of doing the heavy work required.

Numerous experiments satisfied the company that to work the mine profitably, a more powerful mill was necessary, and it decided upon the removal of the old, and the erection of a new one. During this time the work and expenditure upon the mine required by Section 2324, Revised Statutes, was not performed and made, and in accordance with the provisions of that section, the mine became open to relocation. Of this circumstance Ferguson took advantage, and made his relocation on the 2d of April, 1889.

It was not until this relocation that the company became aware that its entry was defective, on account of the non-payment of the \$65 already mentioned. This payment is one of the requirements enumerated in section 2325, Revised Statutes, to be complied with before a patent can be obtained.

From the evidence in the case you find that the company did not intend to abandon its claim, but that its failure to perform the labor and make the expenditure each year required by section 2324 of the statutes, resulted in an abandonment, and rendered the mine open to relocation. I am compelled to concur in that conclusion. The facts are clear, that from the early spring of 1887, to the time of the relocation, in April, 1889, the company neglected to perform any labor or work, or make any improvements on said claim. It did not even remove the old mill, preparatory to building a new one, but sold it, and the purchaser did the removing. This neglect on its part was in the belief that its entry was complete, and that it could safely discontinue its operations, but this was a mistaken belief, growing out of the neglect of its own officers.

Upon the facts in the case the local officers found against the company, and you concurred in their judgment. In the case of *Creswell Mining Co. vs. Johnson* (8 L. D., 440) it was held that "concurring decisions of the local officers and General Land Office on questions of fact, will not be disturbed by the Department unless clearly against the weight of evidence." I find no such situation in the case at bar, and the decision appealed from is therefore affirmed.

The Idaho.

California's Representative Gold Mine.

A correspondent of the *Sacramento Record-Union*, writing from Grass Valley, Nevada county, says:

I donned a suit of rubber clothes, stepped into the cage, and in less than two minutes was 2000 feet beneath the sod. Six feet is all that the man who "shuffles off this mortal coil" asks for, but he who is following the fickle goddess in her dips, spurs and angles, stops not as long as machinery can keep his shaft free from water, and a gold-bearing quartz vein is in sight.

Two thousand feet! The deepest gold mine in the world, the Idaho, one that has made many millionaires, and to-day is the greatest gold producer on the continent!

The *Grass Valley Evening Telegraph* a few evenings since contained the following item:

"On Monday evening the Idaho Mining Company declared a dividend of \$1 per share on the capital stock. This makes 260 dividends declared by the company. The mine is looking well throughout, and is destined for a long life yet."

Two hundred men are employed in extracting the rich body of ore. The shaft is almost vertical, but the machinery is of such a stable character that one trusts himself to the yawning dark depths with little or no fear of accident. Many men, however, have gone down in the Idaho with the full vigor of manhood, who were taken out bleeding and mangled corpses. More men have lost their lives in this richest of all gold mines in the world than in any other similar working in the State.

Three dollars a day. It is good wages, and the man who keeps steadily at it supports his family well, educates his children and lays aside a snug little sum for old age or a rainy day. The neat little homes of the Grass Valley miners indicate a degree of prosperity seen in but few places upon the coast.

County Surveyor Uren, who knows the value of every mine in the district better than any other individual, who has surveyed all their tunnels, drifts and stopes, says that the Idaho is a mine that, in all probability, will pay dividends to its fortunate owners for many years.

It is owned by Edward Coleman, John C. Coleman of Grass Valley, Judge Miles O'Connor of San Jose, and Geo. D. McLaine of San Francisco. It has produced

over \$13,000,000 in bullion, more than two-thirds of which has been profit to the fortunate owners. Edward Coleman is superintendent, and one of the best posted miners on the coast. He made a start at Iowa Hill in gravel mines in the early fifties, and has always been successful in his mining operations.

The Idaho is situated on the south side of Wolf Creek, one mile south of Grass Valley, at an altitude of 2,550 feet. The course of the vein is east and west, with a dip to the south, varying from 55 to 73 degrees. During the years of 1889 and 1890, 39,225 tons of ore, valued at \$20 per ton, were extracted.

It may be stated that there never has been a time since quartz mining began in the Grass Valley district, 42 years ago, but that one or more quartz mines have been worked at a profit, while a similar statement cannot be made of any other mining district on the Pacific Coast. From the best obtainable data, it is estimated that the quartz mines of Grass Valley have produced over \$100,000,000 in gold bullion. This is sufficient to indicate the value and permanence of the quartz lodes of the district and its mining prospects for the future.

The Idaho mill has 40 stamps, 16 concentrators, and the finest water power in the county, having a pressure of over 500 feet. John Carter, an experienced miner, has been foreman for years.

A sketch of the Idaho, without reference to the Eureka, would be like writing "Hamlet" with the Dane left out. The Eureka was located in 1851, just across Wolf Creek from the Idaho, and worked by different parties with poor success, the ore near the surface being low grade. In 1865 the mine was sold for \$400,000, and the Eureka Company was incorporated. The mine had only been developed on the surface. The new company sent down a shaft, and in the next two years took out \$1,200,000, and the mine continued to pay large dividends for years. Its dividend record was \$2,134,000, and its pay chute dropped into the Idaho and the Colemans got it.

The Eureka was so rich that extensions were considered valuable. Judge A. B. Dibble—well known in Sacramento—the leading attorney in Nevada county to-day, was one of the original locators of the Idaho, and at one time owned a controlling interest.

William Watt, the leading man in the Eureka, did not think that the pay chute passed into the Idaho, and he advised Dibble to sell, which he did. It was the advice of a friend and Dibble hastened to get rid of his stock. That advice cost the Judge some millions, but he treasures no ill-will toward his adviser, whose memory is revered in Grass Valley, and as a token of respect for the dead they have erected a magnificent monument to the big-hearted miner who never took advantage of any one and whose purse-strings were always loosened for charity.

GEOGRAPHICAL SOCIETY.—William L. Merry read a paper before the Geographical Society on Wednesday evening of last week entitled "The Nicaragua Canal—Its Geography and Technique." The annual election held on the same evening resulted as follows: Pres., Prof. Geo. Davidson, A. M., Sc. D., F. R. G. S.; Vice-Presidents—T. E. Slevin, LL. D., Justice Ralph C. Harrison, Rev. Robt. Mackenzie; Treas., Harry Durbrow; Home Corresponding Secretary, Jeremiah Lynch; Foreign Corresponding Secretary, Dr. P. W. Poulson; Recording Secretary, John Partridge; Board of Directors—Prof. Geo. Davidson, A. M., Sc. D., F. R. G. S., Thos. E. Slevin, LL. D., Harry Durbrow, John Partridge, Louis L. Nelson, A. S. Lowndes, C. L. Taylor; Council—Jeremiah Lynch, John Dolbeer, J. V. Coffee, Rev. Robt. Mackenzie, Wm. L. Merry, Charles Goodall, F. S. Cook, M. D., Mark Sheldon, Wm. Hood, C. E., P. W. Poulson, M. D., Justice Ralph C. Harrison, C. L. Taylor.

ANOTHER MINING ELECTRICAL PLANT.

An electric-lighting and power plant has just been put up at the Cargo Muchacho mines on the Colorado river, a short distance above Yuma. The mills, offices, boarding house and other buildings are lighted up with 16 and 32 candle power lamps. The same dynamo that furnishes this light, also furnishes power for electrical-hoisting machines. One of the machines is placed in a drift 550 feet below the surface.

THERE are not very many "kickers" over the amicable agreement between the two great interests of the State, but there are a few on both sides. Some people have been fighting so long that they do not want peace on any terms.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MOORE MILL.—Amador Ledger, Feb. 20: S. W. Bright is negotiating for the lease of the Moore mill for the purpose of putting it in order and crushing the rock from his Bell Wether claim.

QUARTZ MOUNTAIN.—Cor. Amador Ledger, Feb. 20: The old mountain still looms up. Several changes have been made lately around mine and mill. Wm. Ford is now superintendent, and Mr. Hoskins foreman of mine, with Sterling Hammack in charge of the mill. Frank Pixley, who is largely interested in the operations, pays us a flying visit occasionally. Negotiations are in progress to open up more mines in this vicinity.

Colusa.

SALT.—Colusa Sun, Feb. 20: Articles of incorporation were filed to-day of the Antelope Crystal Salt Company. The directors are: J. P. Rathbun, P. Peterson, W. P. Harrington, W. S. Green, Geo. B. Harden, P. H. Graham and R. DeLappe. Liverpool salt is the purest known to commerce, but that made of water belonging to this corporation is four per cent purer than the best Liverpool. The location of the works will be on the farm of Mr. Peterson, about three miles north of Sites, and the Colusa and Lake road will run to it. Salt was made at this place over thirty years ago, and it was pronounced good, but it was not pushed with energy, and the temporary works were abandoned. Some months ago J. P. Rathbun leased the ground and began making salt. He developed the fact that water from 23 to 40 per cent salt could be had in unlimited quantities; also that the supply of natural gas was very great, much greater than could ever be needed for fuel to make the salt. He made the summer before last several tons of salt, and last summer ten or twelve more, and made it with a small outlay and a small amount of labor. Salt worth \$25 a ton in the market can be made for \$4 or less, and the manufacture need only be limited by the demand. It is located where transportation will be very cheap. Coal oil is always found with strong salt water, and there is every indication that oil can be had with little expense. The formation just at that place is different from that found at any other place in the Coast mountains. The "dip" of the sandstone rim to the basin is to the east on one side and to the west on the other side—the crests coming towards each other.

Inyo.

THE PROSPECTS.—Inyo Independent, Feb. 16: It is now an assured fact that the ore output from Darwin will be greater this year than at any time since the flush days. The dead work in the Independence mine is now completed, and ore is now being taken out, as is also the case in the Defiance. By means of the improvements recently effected in the former mine, men can now work with no danger to their health. The water supply is sufficient for every requirement. The Promontory mine is looking very well. George Lewis has out about eight tons of ore from the Custer mine, with plenty more in sight. The Pellegrini mine is a fine paying property. Frank Fitzgerald is having a large quantity of wood hauled for operations at Modoc. The Wild Rose will develop into a good property. Jack Gunn is also doing well in the Minnetta. Altogether, the outlook is exceptionally bright.

Kern.

OIL AND ASPHALT.—Los Angeles Farmer: Mr. Louis Blankehorn, the oil expert, who has been prominent in the oil business and supply company's management, has retired from that position, though retaining his interest in the association. He has associated himself with the Messrs. H. A. Blodgett and Solomon Jewett, banker of Bakersfield; he will manage and develop their extensive oil and asphalt interests, including the Standard Asphalt Company. Mr. Blankehorn is now erecting a refinery at Bakersfield, including large storage tanks, stills and other appliances for refining the heavy maltha or liquid asphalt, now produced from a number of wells near Bakersfield into a brilliant varnish asphaltum. The yield of these wells is fifty barrels per day, having a gravity of 90, Baume. The same firm is also engaged in developing lighter oils for fuel purposes. These industries have of late been quite a source of trade for local supply houses.

Nevada.

A GOOD HOUR'S WORK.—Grass Valley Telegraph, Feb. 23: Messrs. Hanly and Gross have been prospecting for a long time on Dead Man's Flat, and have frequently made some very good cleanups; but they excelled themselves the latter part of last week by taking out \$360 in gold in one hour. It is nothing unusual to strike "pockets" on the Flat, but this one was unusually good.

Mono.

THE BONIE CON.—Miner, Feb. 19: During the past week east crosscut No. 1, 700-foot level, was extended 10 feet. Upraise, 500-foot level, Jupiter shaft, was extended 7 feet. Are accumulating some ore from the stopes north of the above upraise. There were employed eight miners, one carman, and jointly with Mono, one engineer, one blacksmith, one laborer, one watchman and one foreman.

THE MONO.—During the past week upraise No. 2, 700-foot level, was extended 14 feet. North drift from No. 1 upraise, same level, was extended five feet. In this drift we are getting small seams of ore.

THE BULWER CON.—There was a lay-off of several men out of this mine a day or two ago, simply because of a plethora of ore in the stopes

and chutes. The ore body being very large and easily extracted, and the chutes all being full, made it necessary to lay off a part of the force. The ore in the face of the stopes continues to be of excellent quality.

SUMMIT.—Work progresses satisfactorily and the extraction of ore continues. A water pipe will soon be laid from this mine to the Lent shaft, and then steam instead of horse power will be used to run the plant.

Plumas.

PLACER.—Plumas National, Feb. 20: W. S. Dean, Nelson Fletcher and Geo. Engleback started to Geness Valley Tuesday to begin work on the John Peel placer mine, situated on Grizzly Creek. A four-horse wagon was loaded down with blankets, provisions, tools and snake medicine. They will be absent until the water season is over. A few days ago, Orr, Stephan, Edwards, et al. located 260 acres of mineral land at Shore's Hill. It embraces a great deal of an ancient river channel supposed to be rich in gold. During the past few weeks the owners have been prospecting the ground, and they say it would pay well from the surface down to the bedrock. Here is a chance for a big mine. Albert Keep and Fred Miller are reported to have a good prospect at Smith's Hill, below rich Bar.

THE CRESCENT.—Plumas National, Feb. 18: The work of rebuilding the hoisting works on this property, that were recently destroyed by fire, is being pushed with all possible speed. A temporary arrangement of pumps is keeping the water out of the mine while a complete new foundation is being put in. The pump-bob pit is walled with solid masonry, and the entire work is being done upon a most secure and substantial plan. The new building and gallow frame will be considerably larger than the old works. The teams of J. S. Hall and Tryon Kelley are hauling the heavy timbers, which are marvels in size and length. When finished the new hoisting works will be complete in every detail of equipment. Suot. Whitney is to be congratulated upon the energetic and thorough manner in which the damage done by the unfortunate accident is being repaired. Jo. Peppin came up from Granite Basin Saturday. He reports the mining outlook in that section to be good. Horace Waldron, who recently purchased the Homestead mine from A. G. Swan has ore that would pay \$80 per ton by a process of working by which the gold in the sulphurets could be saved. By the free milling process, however, the ore will pay largely. Mr. Peppin also speaks in very high terms of Pat. Maloy's mine, near Buck's ranch. He says it is a fine ledge. In his opinion it will pay at least \$10 per ton.

San Bernardino.

GRANITE AND MARBLE.—Los Angeles Express, Feb. 20: Theodore L'Honniedieu, of New York, and C. S. Whipple, of Indianapolis, have closed a deal for a red granite and marble quarry near San Bernardino. For a long time negotiations have been pending between these gentlemen and the parties who own the quarries, but the matter has been kept discretely silent. These people are going to New York to organize a stock company for the purpose of getting out red granite and variegated marble. They pronounce the red granite and marble to be superior to anything found in the quarries of the East. The marble is of beautiful color and highly susceptible to polish.

San Diego.

HELVETIA.—Julian Sentinel, Feb. 18: The Helvetia was started up again on Tuesday, after a week's idleness, eight-hour shifts being put on and work commenced upon a new level to be run west from a point 100 feet down the main shaft. This level will cut a large body of unexplored ground, and it is expected, will add largely to the present fine output of ore from the mine.

Shasta.

Geo.—Cor. Shasta Courier, Feb. 20: The new Reduction Works are to be located where the road from Andrews creek joins South Fork road. The contract for timbers for a building 40x100 feet has been let; also for several hundred cords of wood. Grading begins this week, and as many men will be employed as can work to advantage. Twenty tons a day will be the present capacity. The Crystal folks will supply 10 tons a day for some time. Other ore is in sight and promises, to keep things going for the present. At the Crystal they have been drifting north, thirty feet below the tunnel. Eighty or more sacks of shipping ore has come out thus far below the tunnel. Are now cross-cutting for the east ledge, within ten feet, likely. A 6-foot west ledge has just been struck in the main tunnel. W. D. Bull has shipped a little over two tons, netting about \$500. Eubanks & Co. had some ready to ship, but it was secured by the new Reduction Works. Robinson & Co.'s mines are reported bonded to a promoter of English companies. Mines are being relocated and new ones found in true "boom" style. The arrastres are running as usual. Alfred Ludwig found a large ledge of pay ore on the Ludwig place last week, near the Crystal. Fritz Groner has also found one not far off.

GLADSTONE.—The Gladstone M. Co. of French Gulch will soon have a sawmill in operation on Crystal creek to cut lumber mostly for its own use.

CROSS BOW.—Shasta Co. Democrat, Feb. 20: The Cross Bow Mining Co. has been reorganized, all the indebtedness of the old company liquidated, and the enterprise launched on a solid financial basis. The new company is now at work developing its property on a large scale, and proposes to develop the mine before putting up a milling plant. P. J. Bugbee of this city has a large block of stock in the concern. Last Monday, Lute Bahney showed us a sample of antimonial silver ore which also shows carbonates, which he brought in from a new location he made recently near the After-

thought mine. The ore also carries a fair per cent of lead and zinc. We are informed that the Bell Bros. purchased a claim in that vicinity, the ore from which carries as high as 60 per cent of lead. The Highland mill at French Gulch, owned by Mr. Lowden and Sheriff Hopping, deceased, will crush custom ore for prospectors this summer. Work on the Highland mine will not be resumed for some months. The Schroter Bros. are now putting up a cannon-ball mill on their mine near Shasta. The boys have some good rock to crush.

OLD DIGGINGS.—Cor. Redding Free Press, Feb. 20: There is nothing rushing in the mining line in this vicinity at present. The Texas is working an average force, enough to keep the 20 stamps going. Some six or eight men are employed at the Mammoth, three or four men at the Walker Bros' mine. All other mines and prospects are idle. Still money seems to be as plentiful now as it was at any time formerly in this district.

Sierra.

RUBY.—Mountain Messenger, Feb. 20: Thirty men are working at the Ruby, and the gravel is paying well. Three dividends, aggregating \$15,000, have recently been declared. David Noland, George Fries and Melvin Stewart are mining on the hillside below town, sluicing off the surface. The South Fork boys, at Forest City, think they are near a block of good paying gravel on the old Live Yankee ground. R. H. Judson was in town from the Ante Up ledge last Saturday and reported good running rock at his tunnel. We are informed that the Happy Hollow mine will soon be out of the hands of the Sheriff, about money enough having been realized to pay off the attachments. Wm. Hanley is extending his tunnel for gravel near Alleghany.

Siskiyou.

SCOTT RIVER.—Yreka Journal, Feb. 24: The Scott River Hydraulic Mining Co. intends starting work at its Scott River mine during the coming spring and summer on an extensive scale, the directors having levied assessments on the stock to raise a capital of \$40,000. When work is commenced, a large number of men will be employed and greatly assist in making times lively at Scott River, where there are several other valuable and rich paying mines, both placer and quartz.

WATER.—The rain and warm weather, lately, has caused the snow on the mountains to dissolve rapidly, furnishing a good supply of water for mining purposes. The hydraulic miners have started their giants, while the placer miners are doing considerable ground-sluicing with good success. The quartz mills run by water have also been started. In fact, there seems to be a grand mining boom, which will continue until late in the season, by reason of the great abundance of snow still remaining on the high mountains that will not disappear for several months under the influence of hot weather and warm rains. The old Warren quartz mill, moved from Yreka Flats to Long Gulch, is now being moved to Humbug creek, to be used in prospecting new discoveries in that section. An old former resident of this section in early days is also making preparations to put up a fine new mill on Humbug, which will make about half a dozen mills altogether on that creek.

Tuolumne.

COLUMBIA NOTES.—Cor. Union Democrat, Feb. 20: The Messrs. Grant, Bannister & Co., of the Columbia marble works, are about ready to commence work with their new machinery. They have been building new roads to different parts of their extensive quarry and are now able to fill all orders, however large. The Noonday mine has shut down temporarily, pending the arrival of new pumping and other machinery. They report a five foot vein in the bottom of the shaft. The ore increases in thickness as depth is attained. Messrs. Frank Boyd and S. Hummel have leased the Potter place near Springfield, and are making preparations for active mining operations in the near future. L. Dondero has his usual force at work on his claim at Yankee Hill. Good reports may soon be looked for from this extensive and valuable mine. Caleb Dorsey of Stanislaus county, passed through town last week on his way to his mine north of Columbia. It is said he contemplates the erection of a 10 stamp mill on the property in the spring. Messrs. Woodside and Butenthnath have at last succeeded in opening up their river claim on Otter Bar. The claim embraces quite an area of ground that can be easily worked, and it is said the prospects are highly flattering. Under the able management of Frank McKenna work is being actively prosecuted at Otto Kanig's mine on the Stanislaus river above Parrot's Ferry. The stamps are dropping day and night. Newcomer & Co. of American Camp are now at work on rich gravel, on which they will run uninterruptedly for the balance of the season. Supt. R. C. Davis is again at work in the Old Tuolumne mine.

NEVADA.

Washoe District.

CON. CAL. AND VIRGINIA.—Virginia Chronicle, Feb. 20: 1500 level.—The upraise started at the end of the crosscut run west 36 feet in from the south drift at a point 155 feet south from the shaft station, has been carried up 25 feet. From the same point in this upraise an east crosscut has been run 30 feet in porphyry and quartz of low assay value. From this upraise, at a point 43 feet up from the sill floor, a south drift has been started in a formation showing bunches of ore. 1650 level.—Have continued to extract ore of fair quality from the drift run west from the top of the upraise carried up 59 feet above the southwest drift. Ore of fair quality has been extracted from the drift run east from the winze No. 3 (down 73 feet) in working upward from that point. 1750 level.—In working out and upward from the bottom of winze No. 2, sunk

from the 1650 level, we continue to extract ore of fair quality. Have also extracted some milling ore at the point where the upraise carried up from the crosscut run west from the southwest drift made connection with the stopes on the eighth floor. 1800 level.—Along the south end of the drift running south from the crosscut run east from the winze No. 1, sunk from the 1750 level, we have continued to stope out ore from the sill floor upward of milling value. There has been extracted from all parts of the mine during the week 991 1760-2000 tons of ore, which was shipped to the Morgan mill. The average value of all of the ore worked at that mill during the week, 980 tons, was \$21.66 per ton. Bullion now on hand in our assay office, assay value, about \$13,000. Bullion shipped to Carson mint, assay value, \$25,173.74.

OPHIR.—1465 level.—The north drift started from the drift run west from the winze 122 feet below the sill floor of the 1300 level, 80 feet west from the winze, has been advanced 18 feet, in a porphyry and quartz formation, which yields a low assay value.

UNION CON.—On the 900 level the joint Sierra Nevada and Union Con. west drift from the shaft has been extended during the week 22 feet; total distance west from the shaft 1682 feet. The face is in porphyry and streaks of quartz.

GOULD & CURRY.—200 level.—Work in east crosscut No. 4, which is advanced 139 feet, has been stopped. In main west drift 435 feet from shaft have started a northwest drift and extended same a distance of 20 feet through soft porphyry. West crosscut No. 3, 65 feet above this level, has been discontinued.

BEST & BELCHER.—900 level.—West crosscut No. 1, 100 feet north from top of upraise from 1000 level, has been advanced 10 feet, through soft porphyry and stringers of quartz; total length, 87 feet. Also did considerable repairing on this level during the week.

BULLION.—The south drift, 1500 level, is in 203 feet; face in porphyry. The joint crosscut on north line, 1400 level, has a total length of 184 feet; face in softer porphyry. The east crosscut, 1400 level, 100 feet from south line, is advanced a total length of 68 feet; face in porphyry.

NEW YORK.—The west drift from the shaft, 650 level, is out 431 feet; face in porphyry. The raise from No. 4 west crosscut, 650 level, is up 15 feet; top in quartz showing bunches of good ore.

ANDES.—North drift from east crosscut No. 4 on 420 level was advanced 23 feet; formation quartz and porphyry. West crosscut from north drift from east crosscut No. 4 was extended 12 feet; formation quartz.

ALPHA.—The west drift from the winze, 20 feet north of shaft, is out 175 feet; face in quartz and porphyry yielding low assays.

EXCHEQUER.—East crosscut, 150 feet south of north line, 600 level, is out 289 feet; face in porphyry.

WARD COMBINATION SHAFT.—The southwest drift, 1800 level, is out from the shaft 1130 feet; face in porphyry.

CHOLLAR.—The south drift from the Chollar and Norcross joint crosscut, 1640 level, is in 62 feet; face in porphyry mixed with quartz. Have started an east crosscut 50 feet south of joint west crosscut, which is in 29 feet; face in porphyry. East crosscut, 73 feet south of north line, 1500 level, is in 150 feet; face in porphyry.

POTOSI.—The Potosi and Bullion joint crosscut, 1500 level, is advanced a total length of 88 feet; face in hard porphyry. The Potosi and Bullion joint crosscut, 1400 level, is advanced a total length of 184 feet; face somewhat softer than it has been. Are putting in some timbers at the top of the raise from the 1230 to the 1130 level.

SILVER HILL.—The south drift from the Justice shaft, 490 level, is out 500 feet; face in quartz and gypsum giving low assays.

SIERRA NEVADA.—The joint Sierra Nevada and Union west drift, 900 level, is out west of shaft 1682 feet; face in porphyry. The north drift is out a total distance of 612 feet; face in hard porphyry.

OCCIDENTAL.—The work in north drift from west crosscut from the south drift, 350 level, has been stopped for the present. The east crosscut from south drift, 750 level, is in 28 feet, and has reached the hanging wall. No ore of value was found in the crosscut. Have resumed driving the main south drift. The drift from the Sutro tunnel has been extended 29 feet; total length, 351 feet.

UTAH.—A new drift station, 25 feet in length, has been opened on the 340 level, and a west drift advanced therefrom 15 feet.

Tuscarora District.

DEL MONTE.—Second level.—West drift from North Commonwealth line extended 6 feet. West drift from No. 1 joint raise advanced 8 feet. Cave in No. 1 raise from west drift has been caught up, chutes put in place. Drift started west on ore, from top of raise, and stopping east to connect with line stopes. Line stopes produced 9 tons 1st-class ore, assay value \$261 per ton, and 24 cars 2d class, \$38 per ton. Third level.—No. 1 north drift advanced 18 feet, cutting seams of spar carrying some mineral. Will commence bauling 1st-class ore to sampling works Monday, 22d inst.

NEVADA QUEEN.—Second level.—No. 1 south drift advanced 35 feet in porphyry. No. 2 raise from same extended 12 feet to hanging wall, passing through vein of low-grade ore. Vein 16 feet wide at this point. South intermediate drift extended 15 feet. Fourth level.—West crosscut raise up 205 feet, progress made 23 feet; 35 feet more to reach south intermediate, which has 60 feet yet to be run. After this connection is made, will commence extracting ore, which cannot be done sooner for want of ventilation and chutes.

NORTH COMMONWEALTH.—Second level.—West drift has been extended 12 feet to Del Monte line, in vein matter. Stopes produced 4 tons 1st class, \$250 per ton, and 36 cars 2d-class ore,

\$35 per ton. A drift is being run from bottom of stopes to connect with 90-foot drift; good ore in both drifts, about 30 feet between the two.

NAVAGO.—South intermediate drift below the 350-foot level has been extended 6 feet, showing some good ore in the face.

Lovelock District.

BRIGHT MINING OUTLOOK.—*Cor. Silver State*, Feb. 20: The mining outlook for this district has never appeared better, and more prospects will be worked and more mines opened than ever before. The Arabia has been working steadily all winter and the body of ore has been steadily getting larger and richer, until now it can safely be placed among the dividend paying mines of the State. Mr. Stone, the gentleman who is at the head of the company owning the mine, arrived from the East last week and has gone to San Francisco, where the company owns a smelter. He expects to open up the mine this spring to sufficient extent to work 75 men, and will put in electric lights and drills. White Cloud, a mine recently bonded by Mr. Lovelock to L. V. Hitchcock of Erie, Pa., for \$75,000, will be opened about the 1st of March. A large new boiler has just arrived from the East for the hoisting works. A Mr. Martin of Detroit, Mich., is here. He is interested in the Trinity mine and has a number of men at work in that camp. They are putting up a Huntington crusher and will be running in a few weeks. Dr. Hutchins has a large force of men at work at his antimony mine, and the Bell nickel mine is still taking out large quantities of rich ore and must now have 1000 tons or more on the dump. When I say that the mining outlook is bright, I judge from the fact that at least 500 men will be employed in the mines tributary to Lovelock.

Monkey Wrench District.

RICH FINDS.—*Pioche Record*, Feb. 18: Encouraging news has just been received from this peculiarly styled location that shows the camp to be on the improve instead of the decline, as is so often the case with those extremely rich finds. Mr. Joe Cassidy was in town this week from that place, and not only brought with him the good news, but huge average samples of ore to be tested. The rock was of a free-milling character, and assayed in silver respectively 67, 132.40, 257.30 and 1974.50 ounces per ton. Quite a number of our citizens are becoming excited over the present outlook in that locality, and general appearance indicates there is apt to be a great rush to that section very soon.

Silver Peak District.

AN EXAMINATION.—*Walker Lake Bulletin*, Feb. 17: Mr. W. T. Charles is the authorized agent of the Messrs. Blair, the New York millionaires, who own the Silver Peak mines, in this county. He has made a very thorough examination of these mines, devoting several months to that purpose, and he informs us that they are the biggest thing he has seen on the Coast. The ore is gold, and of comparatively low grade, but there is a mountain of it, and it is practically inexhaustible. He predicts that, in the near future, work will begin on these mines on a large scale, and give employment to thousands of men. The present stagnant condition of things is owing to the indifference of the senior Blair—who is over 90 years old—and being very wealthy, does not care to enter the race for more money. His sons however, are eager to begin work.

ARIZONA.

MINERAL PRODUCT.—*Phoenix Gazette*, Feb. 20: The mountains surrounding this magnificent valley are impregnated with precious metals, much of which is not yielding to the indomitable efforts of the hardy miners, but as to the development of our mineral resources, our mountain ranges and vast deposits of ore bodies are almost undisturbed, and form one of the many attractive features of our county and offer a wide field for speculation. That these immense beds of ore will be long be utilized, is beyond question. In fact Arizona is a virgin field, but the passage of the Stewart bill, permitting aliens to hold and operate mining properties, will have a tendency to hasten operations in Arizona. Besides the production of precious metals, the output of copper from the Territory is steadily increasing, and to-day Arizona is third on the list as a copper-producing Territory, and within the next two years we will be second on the list of copper-producing States. And since copper has gone up in the markets of the world, many speculative individuals from across the sea have invaded Arizona with a view of purchasing undeveloped copper properties. We can say in all candor that the future of this country shines like a star, and with an undivided people intent upon the prosperity and development of this valley, nothing but the Omnipotent hand can prevent her rapid and easy march to success. Water, soil, climate, and a thrifty, united people form a happy and an irresistible combination of favorable circumstances which will make this valley one of the leading sections of this grand union.

GOLD BASIN MINES.—*Mohave Co. Miner*, Feb. 20: The mining claims owned by John P. Barnett and J. C. McKenzie will have a large amount of work done on them this spring and summer. The Senator has a tunnel 115 feet in, and it is expected, will tap the vein in about 10 feet. The ledge is about 45 feet in width. About five tons of ore from the croppings were run through an arastra and netted \$55 a ton in gold. These gentlemen have another location on the same vein, which they have named the President. The rock, in places, is immensely rich, while the ledge, as a whole, is good-grade, free-milling gold ore. As soon as the mine has been opened up sufficiently, a large reduction plant will be put up on the river near Scanlon's ferry. A narrow gauge railroad will connect the mine with the mill. One-half interest in an

adjoining claim, owned by Henry Schaefer, has just been sold to Colorado parties at a good figure, and considerable money placed on deposit for a working capital. Development work will be commenced immediately on the mine. There are four men at work on the Golden Rule. The ore is free gold and will be worked in the O. K. mill. The O. K. Co. will put a number of men to work on the Excelsior mine in a few days. Henry Schaefer has sold the Southern Pride, Golden Slipper and Josephine mines to the Good Hope M. Co. of Perris, San Diego county, California. The price paid for the property, we understand, was \$12,000. The properties are said to be among the best in the district. The new owners will immediately commence extensive development work on the property.

BRITISH COLUMBIA.

REVELSTOCK.—*Star*, Feb. 20: Messrs. John Stauber and Charles Matheson arrived at Revelstock last Saturday from the Lardeau country, where they have been mining for gold on the Lardeau creek ever since the latter part of last summer, with the exception of the last month or six weeks, during which they have put in their time hunting and trapping. They made from \$4 to \$5 a day per man for every day they worked, and have so much confidence in the future of that district that they intend returning there in a very short time. Mr. Stauber says the Lardeau is good enough for him, and that he has seen enough to satisfy him that there is a great amount of gold awaiting the miner's pick in that section. Only a very small portion of the country has been prospected, and there are indications which point to the Lardeau as being quite equal to Cariboo in its palmy days. After the heavy snowfall stopped work on their claims, they took to trapping, and were very successful in that line.

COLORADO.

NOTES.—*Idaho Springs Gazette*, Feb. 20: Peeler and Co. milled two tons of ore from the Ironton lode. John Hull shipped from the Henry Clay lode up Dry gulch. Jas. Young and Co. shipped a couple of tons from the Ward lode. John Easley had a mill-run from his lease on the West Alabro this week. Sam Bretbour shipped from the Gem extension to the Idaho sampling works this week. Chas. Bateholder shipped a load of ore from a prospect on the hill above the mouth of Chicago creek. L. A. Turner & Co. have taken hold of the 7-20 mine, and propose to develop it into a paying mine.

IDAHO.

THE FRENCH BOYS' GROUP.—*Wood River Times*, Feb. 15: The French boys' group of claims, on the Bullion divide, which was bonded a few weeks ago, for \$14,000, is likely to be bought and paid for within two weeks. The French boys' group consists of seven or eight claims, of which Louis Pelissier owns by far the largest interest, Auguste Thouvenot, who joined with Louis Pelissier in the bond, only owning in two of the least valuable claims. A. F. Montandon, who owns one-third of the claim in which ore was uncovered recently, has not bonded his interest.

SNAKE RIVER PLACERS.—*Idaho Falls Times*, Feb. 15: A gentleman was sent here last week to investigate matters. After a day's stay in Idaho Falls, he took his departure for points lower down the river. The gentlemen claimed, from what he knew of the bars in the bed of the river, with one-half decrease in the flow of the water in Snake river, a flow of 400 miles would be thronged with miners. It is well known that the various canals which are being taken out of Snake river will have a tendency to lower the water during the midsummer months, which will not only expose the rich bars, but furnish abundance of water for sluicing purposes. Since the canals have been taken out in this vicinity, there is already a perceptible difference in the volume of water at points from 100 to 150 miles below here to our certain knowledge. The high waters in the spring again supply the bars with gold, and we cannot see why mining on Snake river will not be a perpetual thing, giving employment during the summer months to thousands and thousands of men. Verily, it is a bonanza, and a few years only will prove the truthfulness of our assertions.

STODDARD.—*Silver City Enterprise*, Feb. 24: Sinking is still being continued on the west winze, in quartz. It is now down 95 feet.

TRADE DOLLAR.—*Tunnel No. 1*—Drifting north on the vein, which is three feet wide, with ten inches of \$200 ore on the footwall. *Tunnel No. 2*—Stopping is being done; vein is about three feet wide, with about ten inches of shipping ore. Crosscutting west to cut Jumbo ledge, which they expect to reach this month. *Tunnel No. 3*—Being driven north as fast as possible to cut the rich shoot of ore found in No. 2. The ledge in the present face is four feet wide of good milling ore; 3753 pounds of ore were sent to the railroad this week, making in all about 16,000 pounds of ore now stored in Falk's warehouse, of an average assay value of \$2500 per ton, which will be shipped in a few days, or as soon as the balance of the carload is sent from here.

BLAINE TUNNEL.—The tunnel which was originally 4x6 feet, and about 600 feet long, has been widened to 8x8 feet the full length, and is being driven ahead at the rate of eight feet per day. Double track has been laid the full distance, and the air plant is making the rock fly. Everything is running along splendidly.

LOWER CALIFORNIA.

THE MASAC CONCESSION FORFEITED.—*Lower Californian*, Feb. 12: Those persons who are interested in the progress and development of

Lower California will be glad to learn that the large mining territory situated near the town of Real del Castillo, in San Rafael Valley, which was ceded to Mr. T. Masac by the Mexican Government about four years ago, has been forfeited by the concessionaire and will be thrown open to the public. The territory, rich in silver and gold, which has been closed to prospectors and mining men all this time, is ten miles square. Numberless experienced miners have always believed it to be the richest territory in the northern district of Lower California, if not in the whole peninsula, and a large influx of prospectors into it can now be expected. It has long been known that the requirements of the concession on the part of Mr. Masac have not been fulfilled, and this fact has caused great dissatisfaction among not only miners who know of good properties in the territory which they were anxious to locate and develop, but farmers and others who had settled in the Real del Castillo and San Rafael, and who have witnessed the decline in business in their community as a result of Mr. Masac's failure to comply with his contract with the Government and develop the immense property. Now that the public will have a chance at it, we look for good times in the Real del Castillo and a better feeling among the people of the surrounding country.

THE BUTLER MINES TO BE WORKED.—*Lower Californian*, Feb. 5: The Butler group of mines in Alamo will be developed. This is good news to everybody in Alamo and Escondido, and upon the result of the development of these mines will, in the minds of a great many persons, rest the permanency of the camp. Mr. A. H. Butler, the owner, has been tireless in his efforts to interest capital in the properties, and he has at last met with success. Some weeks ago, Mr. E. A. Brennan, a mining expert, came to examine the mines in the interests of two well known San Francisco capitalists, and his report to them upon his return resulted in the organization of the Tomasa Hill Mining Company, whose object is to develop the Butler group of mines in Lower California. The mines are seven in number and are known as the Hattie, Gen. Torres, Reed, Dora Mettel, A. H. Butler, Arabella and ——. Mr. Butler retains an interest in them. It is expected that matters will be in such shape that work may be commenced in about three weeks. First-class machinery will be imported, and the first work to be done will be the sinking of a shaft on the Arabella to a depth of at least 500 feet. Mr. Brennan will superintend operations.

MONTANA.

AT BUTTE.—*Inter-Mountain*, Feb. 20: In the Butte mining field, in view of the extremely low price of silver, it is of some interest to the public to know that the great mines and mills of the camp are still running to their full capacity. How long they will continue to do so is problematical. Supt. Hall of the Alice Co. said yesterday that if silver kept hovering about the ragged edge of 90 cents, it was only a question of time when all the silver producers of the camp would be compelled to shut down. The Granite Mountain of this State, and the Ontario of Utah, he said, are the only great silver mines, of which he has any knowledge, that can long keep up production under existing conditions. With silver at \$1, the Alice properties will return handsome dividends; at 95 cents, a small margin of profit remains after paying working expenses; at 90 cents, Mr. Hall said, the Alice is worked at a loss. The Alice properties are located in one of the best silver-producing sections of the district, and their aggregate output up to date exceeds that of any other mining company in Butte. With their own mills to work their ore, with the best of mining machinery, and with the most careful and economical management, the Alice Co. should realize a profit if any company can. The effect of the low prices of silver is already apparent. During the week the Clear Grit was shut down, and all the men at the Black Rock were laid off, except eight or ten, and it is understood that they are to be laid off to-day. As far as could be learned, no new work of any moment has been begun on the hill. The great copper mines of the camp are all running in full blast, and in that direction new developments are being pushed with satisfactory results. Among recent enterprises, perhaps the one most worthy of note is the sinking of the Anderson shaft, near the Parrott schoolhouse. That shaft was begun on the 5th of October last, and is now down 200 feet. In sinking, a 15-foot vein of gold ore was cut. Two veins are known to exist in the company's claim, and a crosscut is now being driven from the bottom of the shaft to cut the north vein. It is thought the vein will be reached in a few more days. There is a great deal of ore stored on the dump, no shipments having yet been made. The capacity of the hoisting plant will shortly be increased by the addition of a new and more powerful engine than the one now in use.

OUTSIDE DISTRICTS.—From the outside camps of the State, very encouraging reports have been received. The Cumberland mine, in the Castle district, is being worked more successfully than ever before. The ore body is so large and its extraction so easy, that six men in the stopes readily supply the two smelters with ore. The largest output of the smelters for any one day was made a week ago yesterday, when two carloads of bullion were run out, and it was the result of about 90 tons of ore. On Monday last, the company paid \$75,000 on its indebtedness, and on Tuesday a controlling interest in the property was sold to J. K. Todd & Co. of New York. Work on other mines in the camps is being pushed with gratifying results, but owing to the want of smelting facilities and the long distance to a railroad, the ore taken out cannot be handled at a profit. Consequently, it is piled up on the dumps to await future developments. Some of the Neihart mines are panning out well, and, accord-

ing to the *Husbandman*, the Montana Gold, Silver, Platinum and Tellurium M. Co., last week, shipped a carload of ore taken from a drift, without sorting, that yielded \$135 per ton. At Barker are some of the best silver-lead properties in the State. Regular shipments of ore have been sent out from there since the completion of the branch railroad, most of it going to the Colorado reduction works.

NEW MEXICO.

AT CENTRAL.—*Southwest Sentinel*, Feb. 16: The recent strike of Bennett & Potter, at Central, is reported as having pinched out, but there is said to be a large body of high-grade ore in a claim adjoining that located by Bennett & Potter. The Bremen mill, operated by the Grant County M. & M. Co., is temporarily shut down, on account of the heavy roads, which have made it almost impossible to haul ore this month. Most of the ore which has been shipped from Cook's Peak has been shipped by wagon train to Florida station, but preparations are now being made to have the ore shipped to Crawford station from the mines on the west side. The Anson S. smelter, at Ansonio, is now in full blast, and M. W. Neff, who is largely interested in the mine and smelter there, expects to have \$10,000 worth of copper bullion ready for shipment in a few weeks. Morehead & Jasper, owners of the Maid of Monterey mine, at Pinos Altos, have 100 tons of ore out, which assays from 15 to 25 ounces in silver per ton, \$3 in gold, and carries considerable lead and copper. They will haul this ore to the Grant County M. & M. Co.'s mill here for concentration. R. P. Barnes brought in 29 ounces of gold and silver bullion, valued at \$8.80 per ounce, and 250 ounces worth \$1.57 per ounce, from the Steeple Rock M. Co.'s mill, last week. The mill has not been running steadily, or the amount of bullion brought in would have been much larger. Cook's Peak is now the leading lead-producing camp in the Territory, and there is every reason to believe that the production will be doubled this year. New strikes there are of frequent occurrence, and the development of the older mines in that district has shown that the ore bodies extend to a great depth. Five years ago, the production of this camp was insignificant, but now it must be ranked among the important camps of the Territory. Work will probably be resumed on the American mine, at Hachita, before long. The property was purchased, at the recent sale, by the owners of the Surprise mine, in the Cook's Peak district.

OREGON.

NEW LEADVILLE CAMP.—*Bedrock Democrat*, Feb. 20: The attention of practical mining men and capitalists is now, more than ever before, directed to the great mineral wealth of Eastern Oregon. Work already accomplished on the New Leadville mines, in Grant county, proves beyond the possibility of a doubt the immense wealth of that region. Major Downs, the superintendent of the Vultura, a mine in this group, reports developments in that mine of a most gratifying nature. The main shaft has attained a depth of 130 feet. Three hundred tons of ore, carrying 30 ounces of silver to the ton and 70 per cent of lead, is already on the dump, samples of which may be seen at the Statesman office. The necessary reducing works will soon be in operation, and when this is done, those vast stores of hidden wealth will go to swell the greatness of that State. Practical men have charge of these mines, and prominent capitalists are interested in their development.

GOOD RETURNS.—*Jacksonville Times*, Feb. 6: Dr. Braden's quartz mill at Gold Hill has been busily engaged for some time past, and with good returns to the owner, it is said. The present dry spell is discouraging to placer miners, as the supply of water has been exhausted in some places. A wet spring would help matters materially. If people discover placer mines in a stream, they are not at liberty to cut timber from adjacent public lands as they might do for quartz mining. This is a recent decision of Commissioner Carter of the General Land Office. Operations on the Comstock mine of Oregon (which is located in Willow Springs precinct) have been suspended for the present, owing to dissensions among the owners. A run was made on low-grade ore recently and proved satisfactory. The mine and mill have been closed by an attachment instituted by the employees of the company. A late Gold Hill dispatch says: On account of the scarcity of water, many of the miners have abandoned their placers, and are putting in their time prospecting for quartz. "Lucky" Bart's find on Sardine Creek is attracting great attention.

UTAH.

PARK CITY.—*Record*, Feb. 13: That the future of Park City as a rich mineral producer is assured for years to come is witnessed by the fact that the *Record* can again this week announce another new strike of good, clean shipping ore. Last summer Rosecamp and Glenn started a tunnel on the California claim, owned by themselves, M. S. Ascheim and Chris. Christensen. They drove the tunnel something over 100 feet up to last fall, and in doing so cut a number of streaks of low grade ore, varying in width from a few inches to several feet. These veins contained a large volume of water and caused the boys considerable trouble, but by close timbering and a good flume they were able to go ahead with developments, and continued the tunnel they were driving. Last week their labor was rewarded by cutting a nice vein of good clean ore and they are now in a fair way of securing a bank account. The ore is dense in grain, very black in color and heavy enough to run very high in both silver and lead, and though no assays have been obtained, good judges pronounce it fair ore.

SCIENTIFIC PROGRESS.

The Science of Physiognomy.

Can Character Be Read from Heads and Faces?

The study of character by observing the cast and expression of the human head and face is of great antiquity, and is known by the term "physiognomy." The claim of physiognomy to be considered a science, has been regarded differently by different persons for the last 2000 years. Some are enthusiastic in the affirmative, others as strong against it. Still, it has occupied the attention and study of the brightest men of every age, from the days of Hippocrates about 460 years before the Christian era down to the present time. Hippocrates wrote upon it as then being a subject upon which scholars had long been much divided. Socrates, who was his contemporary, was a full believer, and wrote the earliest systematic treatise upon the subject which has come down to us.

We have the record that Egyptian scholars, also, wrote largely upon the subject, and mostly in the affirmative. References to physiognomy are also found largely scattered through Greek and Roman classics. The literature upon the subject is very extensive, and of itself would form quite a library. The sixteenth century was quite rich in publications on physiognomy. Some 25 or more noted writers of that time wrote more or less fully upon the subject.

The writers of the following century generally attempted to bring discredit upon it, and more than 30 prominent writers and scientists of that time are recorded as entering upon such discussion mostly in the negative.

The first really elaborate attempt, in recent times, to elevate physiognomy to the rank of modern science was made by Lavator in 1775-8. The first real scientific school of physiognomy was founded by Sir Charles Bell in his "Essay on the Anatomy of Expression," published in 1806. A republication of Lavator's work soon followed, and gave an additional interest to the subject. "The correlation of the physical actions and psychical states" was made a subject of interesting speculation by Spencer in 1855, and those speculations were reduced to a system by Darwin in 1872.

We have been led to these reminiscences by a hasty perusal of two large volumes upon this subject, lately written by a well-known lady resident of this city—MRS. MARY OLMSTEAD STANTON, who has devoted a large portion of her life study to the subject of physiognomy. This lady had previously published several less pretentious volumes, but in the present work, consisting of over 1200 large octavo pages, under the title of

"A SYSTEM OF PRACTICAL AND SCIENTIFIC PHYSIOGNOMY; OR HOW TO READ FACES."

The author has given a most complete manual of instruction in the knowledge of human physiognomy and organism, embracing the discoveries of located signs of character in the body and face. The work is most profusely adorned by elegant and life-like engravings illustrative of the text, and printed on very heavy paper of the finest quality. It is dedicated "to the lovers of science—to the earnest and enthusiastic searchers for truth throughout the world."

These volumes display a most thorough knowledge of the subject, and constitute, really, the most complete formulation of this system of mental science which has hitherto been presented to the world. It is written in a plain, practical manner, such as would readily admit of its being introduced as a text book into our high schools and colleges.

No person can rise from even a cursory examination of the work without feeling that scientific and practical physiognomy should be introduced as a part of our common school education and advanced, by gradation, to our very highest institutions of learning. This study, commenced as it should be with its simplest principles, with the very beginning of our grammar grade of schools, could not fail to greatly advance the mental, moral and physical conditions of all humanity on which it might be brought to bear. Better, perhaps, than almost any other line of study, this study might be made to carry forward the evolution of the race to the very highest type of humanity. It is also well in line with an earnest and religious regard for the young, without the least touch of sectarianism. It is really a study of divinity in its highest manifestations of creative energy, and leads directly into the path best calculated to enable us to make the best possible use of the form and mental capacity with which humanity has been endowed.

The Philosophy of Electrical Action on Vegetable Growth.

TO THE EDITOR:—From recent experiments in France and other localities, so frequently alluded to of late in your columns, it has been demonstrated, beyond all doubt, that the application of the electric current to certain species of vegetation has the effect, in some mysterious manner, of accelerating their growth. The question therefore naturally arises, by what law are such effects produced upon vegetation. Is it true, as was formerly the general belief, that electricity is a fluid substance, contained by all material things, and that this fluid is composed of, or contains, the necessary fertilizing properties, sufficient to produce such effects upon the growth of vegetation? If such is the fact, then the application of electricity to the barren lands in certain sections of our country would have the effect to clothe them with vegetation and give value to the sterile and barren wastes upon our planet. But, owing to the advance in thought of the present century in relation to natural phenomena, the conclusion adopted by our more advanced scientists is that electricity is not a fluid substance, but that it is a force or a form of energy. If such is the case, and it does not contain within its composition those elements necessary for plant life, by what law then (would be naturally asked) does simple force or energy have the effect to stimulate the growth of vegetation?

In order to give a satisfactory answer to this question, it is first necessary to understand, or, at least, to have some idea of the process by which plants are caused to grow. Now, the phenomenon of the growth of all forms of organic life is due to a combination of the elementary atoms contained in the soil, and it is only when such atoms are in activity that their combination and crystallization into organic substance is possible, and that such combinations and the solidifying of the atoms is an effect of the interference of their motions. We arrive at this conclusion from an investigation of other phenomenon, as, for instance, in the phenomenon of light. It is demonstrated by experiment that an interference in the motions of the atoms which give to our minds the conception of light, have the effect to destroy the phenomenon and to produce darkness. So, also, in sound it is found that an interference in the sound waves has the effect to produce silence. For such reasons, we are justified in the conclusion that if the atoms which compose the various elements were at rest, the formation of substance would be impossible, but that it is in consequence of their continual activity and as an effect of their interference that solid substance is produced. The reasons why such effects are the result of an interference in the motion of the elementary atoms, the peculiar process by which such effects are produced, as well as the operation of the laws which regulate their motions, is, of course, beyond man's conception; yet we find that the law is uniform and constant in its operation, a fact of which the existence of the universe, with its endless variety of phenomenon, furnishes sufficient evidence. Under such circumstances, it is evident that any means that it would be possible to adopt, which would have the effect to accelerate the motions of the elementary atoms contained in the soil, would, from the nature of things, accelerate the growth of vegetation upon its surface, since the interference in their motions and consequently their combination, would proceed at a more rapid rate, and their crystallization into plant life would be accelerated in a corresponding ratio. It is for such reasons that vegetation under glass, as well as steam pipes buried beneath the soil, have the effect to put into greater activity the elementary atoms of the soil, by a contact of atoms and to accelerate the growth of plants.

For such reasons as given, we are justified in the belief that this mysterious phenomenon known as electricity is simply the motion of atoms of some one of the elements, varying, of course, according to circumstances, or of the conditions under which such motions are produced; for instance, there are reasons for believing that the lightning flash is an effect of the intense motion of the atoms of oxygen gas which has accumulated in excess in the atmosphere above, set free from the surface of the waters of our planet by evaporation, while it is possible that the phenomenon of plant growth may be accelerated by stimulating the motion of the atoms of carbonic acid gas within the soil by imparted motion, produced in the battery by the decomposition of metallic substances; and in my opinion, it is this motion imparted by contact to the elementary atoms of the soil, by the intense motion of atoms of certain elements from without, which is termed the electric cur-

rent, that explains the mystery of the increase in the growth of vegetation, as an effect of its application.

The evidences presented by the fossil remains of various forms of organic life, found beneath the earth's surface, show us that in prehistoric ages all forms of life were of a gigantic growth, compared with the present; hence the question would naturally be asked, why are all forms of life gradually decreasing in dimensions? Is it because the elements of which they are composed are being continually lost or destroyed? No; but since experiment has demonstrated the fact that in order to increase in dimensions the growth of vegetation it is necessary to stimulate the atoms of the elements which compose them into greater activity, it is therefore evident that the gigantic growth of organic life in the past, was owing to the greater activity of the elementary atoms. But why their motions should gradually decrease, or by the operation of what law such effects are produced, or for what special purpose, is, of course, beyond man's conception. At any rate, judging from the present growth of all forms of organic life, compared with their dimensions in the past, it is evident that the elementary atoms are tending to a passive state, for which reason we must assume that a state of rest is the normal condition of the elementary atoms of which the universe and all things are composed. It is therefore only a question of time when the universe, with its myriads of celestial bodies, will become, like our own satellite, a cold, lifeless collection of dark masses, having fulfilled their destiny, as designed by the Creator and Ruler of all things, have now become a collection of cold, lifeless and dark objects, like old abandoned hulks upon the ocean, floating at random in space.

C. W. HASKINS.

MECHANICAL PROGRESS.

Old Versus Young Mechanics.

The strict rules of trades unions in keeping down the number of apprentices which may be allowed to any given shop is working great injury in many ways. In the first place, while closing tightly the doors against their own sons, and young men generally, they are opening them all the wider for those who come to us from abroad fully prepared to enter our shops as journeymen workers. Our own young men are thus boycotted in favor of new comers from abroad, and many of them are necessarily compelled to grow up in idleness, with no trade and nothing but unskilled labor to lean upon when the burden of life and family responsibilities come upon them. The result is disastrous not only to themselves and families, but to the community at large as well.

But this is not the only evil which arises from such unwise action. Antipathy is not too severe a term to express the feeling that has gradually grown up in many, if not most, shops where old and young mechanics are brought together—a feeling which is even more intensified against apprentices. It requires no very close observation to detect this feeling or the ill-effects to both the individual and general welfare of the shops where such antipathy exists. Would it not be better that some way should be devised to remove this troublesome condition? A little thought and honest reason ought to convince, at least the men with families, whether natives or not, that it would be better to call a halt and adopt rules which would fill the shops with their own sons, benefit our own people, and give to the apprentice and young mechanic a better feeling and a more manly bearing than can possibly be expected under the present condition of things. A writer in the *Scientific Mechanic*, in alluding to this matter, says:

"The young man, in serving his time and long after, meets with many disadvantages in the way of not having done, or not having seen done, the work he is now asked to do. With his limited experience, he naturally goes at it in an awkward manner, and right here is where the older and more experienced hand has the opportunity of showing that charitable feeling that should characterize and control the human race, by approaching him and offering his assistance, and not allow this feeling of superiority and opposition to influence his action.

"And, again, care and judgment should be exercised in approaching the inexperienced shopmate so as to cause no offense, and I feel quite sure when he realizes how you so ably assisted him, he will always, in the future, appreciate the kindness and respect you have shown him, and at some time later on perhaps it will be profitable and convenient to exchange ideas with this young man. For this reason, and

many more, this feeling should not exist, and if the elder mechanic of to-day would take this view of the matter, there would be no such feeling. On the other hand, it is not impossible for the young man to have in him the making of a better mechanic than any of his associates, and, therefore, need no assistance. In this case, he will in all probability be given the choice of particular work of the shop. It is then very easy to detect this stored enmity, and it comes forth in such expressions as 'He's a pet of the boss,' or 'He has rich relatives, which gives him preference,' etc. And I say to those who use such language, you show not only your malice, but ignorance also, and destroy any good quality you might have in other directions. It is much more becoming the older mechanic to encourage the young man, and accept the situation philosophically."

A GOOD STUMP PULLER—one that could be worked simply and at little expense, that could be sold at a reasonably low figure, would be a great desideratum for the farmer in wooded districts—such a machine seems to have found its way to Oakland, and is described as follows: The machine was put to a small stump about three feet in girth, and it was taken out in one minute and a half. The machine was then put to a large stump measuring ten feet in girth, and it also yielded to the enormous power in ten minutes. The machine is hydraulic, with eccentric wheels, and is easy to move from stump to stump. The water power is a few gallons of water that is used over and over again. The inventor claims that with it two men can uproot stumps and trees up to 16 feet in girth in from two to ten minutes each. The company is formed into a stock company, and they intend giving trials in all the leading towns.

NEW SOAP FOR METAL WORK.—The soaps used for cleaning metal work usually consists of mixtures of vaseline, oleic acid and fat, mixed with a small quantity of rouge. When freshly prepared they leave nothing to be desired; but, unfortunately, such mixtures soon turn rancid and become unfit for use. A new soap for metal work, which is stated to be free from this objection, is made from cocoanut butter in the following way: 2.5 kilos. of the butter is melted in an iron vessel, together with a little water, and to the mixture is added, with constant stirring, 180 grms. of chalk, 87.5 grms. of alum, 87.5 grms. of cream of tartar, and 87.5 grms. of white lead. This mixture is then poured into molds and allowed to solidify. The soap so obtained is made into a paste with water and rubbed over the metal to be cleaned, and finally removed by a dry rag or chamois leather.

EDISON'S PATENTS do not seem to have thus far brought him much direct wealth. In a recent interview he is reported to have said: "From my various patents, so far as the patents themselves go, I have stood an actual loss in experimenting and in lawsuits of \$600,000. I should be better off if I had not taken out any patents. I do not mean to say that I am a pauper, as you might think from my talk, but my money has not been made out of patents or out of any protection that the Patent Office has given me. I have made it all in manufacturing, and I have made quite enough to pay for my experiments and to get a good living, which is all that I care about. I have worked on as many as 40 machines at one time. An exhibition of all the machines that I have worked at and experimented on, if I had kept them, would cover about 25 acres."

THE BATTLE BETWEEN PROJECTILES AND ARMOR PLATES.—The late successful tests between American and English and French armor plates at Annapolis, in which American superiority was shown, seems to have aroused the energies of our English cousins to once more take the lead. An English paper states that some very exhaustive armor plate trials have of late been conducted at Portsmouth, which have demonstrated that there is a British process that produces plates equal, if not superior, to any that have been experimented with in America. The process gives results such as have been sought to be attained by the Harveyization of the best highly carbonized nickel steel. If this is so, it is now our turn to reach out once more for a new step in this direction.

A NEW PAVING MATERIAL now being introduced in London is composed of granulated cork and bitumen, pressed into blocks, which are laid as brick or wood pavements. A pavement of this material is very elastic and pleasant to the feet, and affords an excellent foothold for horses. There is almost an entire absence of noise.

ENGINEERING NOTES.

Canals and Deep Water Ways.

A large amount of interest seems to be engaged, just at this time, in opening up water ways for transportation in various parts of the country. In our own State, much interest is felt in the proposed canal through the San Joaquin valley; and no wonder, when the railroad charges are as much for haulage from Visalia to San Francisco as for the same amount of transportation from Visalia to St. Louis.

Careful estimates show that a good and continuous water way can be opened from navigable water on the San Joaquin to Buena Vista lake, a distance of about 220 miles, for about \$1,205,000, an average of about \$5,500 per mile; thus opening to the cheapest kind of transportation one of the grandest and most productive valleys in the world; and one capable of supporting about as large a population as is now found on the entire Pacific Coast.

With such a canal, and a proper location of feeders in the shape of cheap electric roads along both sides of the canal, there is no estimating the amount of products which might be marketed, or the wealth of land which might be thereby created. That such a work will soon be accomplished there can be no doubt, and it should be constructed as far as possible, by persons having interests in that valley which call for cheap transportation. Such a work should never be allowed to fall into the hands of outside owners whose charges might be "all that the traffic will bear." This subject will soon be before Congress. The Secretary of War has already transmitted Major Heuer's report on the practicability and need of the improvement.

Another important California improvement is the projected canal from the head of San Francisco bay to San Jose, so as to connect that growing city directly with all the great water ways of the State.

DEEP WATER WAYS AT THE EAST.

The combinations of railway facilities is everywhere driving the people to protect themselves by going back to the old time systems of transportation by canals. There is a determination to secure cheaper transportation between the Great Lakes, into the vast country bordering upon Ohio, by a deep water ship canal through the center of that State to the Ohio river. Preliminary surveys have been made and there is no doubt but that a practicable and easy deep water way can be found.

Energetic measures are also being taken to secure a first-class ship canal—sufficient for war ships from New York inland to Philadelphia, connecting the Delaware and Chesapeake Bays. Such a canal will be but the beginning of a grand inland water way throughout the entire distance of the Atlantic coast to the Gulf of Mexico, and possibly through the upper portions of Georgia, Alabama and even to the Mississippi river, some two or three hundred miles above New Orleans. Such thoughts are even now in the minds of enterprising, progressive capitalists and engineers.

Such a work may appear chimerical, just now, but there is no computing its value both in peace and war. When this nation again doubles its population, which it will do during the lives of many who are now in the meridian of life, and we number over 120,000,000 of people, no useful project will be too great or too costly to be accomplished.

Our lake shore traffic has already reached a magnitude which no one could hardly have dreamed of 50 years ago, and it is growing with a rapidity absolutely startling. What it will be by the middle of another century no man can tell—no man will venture to compute. The eyes of the entire nation are now turned in that direction and estimates and calculations are being made for improvements which are greatly needed, and which will soon become indispensable. Our neighbors on the other side are outstripping us in this direction, with possibly a more special eye to the probabilities of some future international conflict as well as to the needs of commerce.

A 21-foot channel around all obstructions to natural navigation, is what is needed and demanded from Lake Superior to the Atlantic, by those who are urging active measures in this direction. Canada, with her three millions of people, has already spent \$60,000,000 in perfecting a deep water way on her side; while this country with its sixty millions has spent less than half that sum.

Even with that small expenditure the saving in transportation during the last year only, is said to have been \$150,000,000 more than the total cost of those improvements. It is claimed that only \$3,000,000 more of expenditure would give us 20

feet of water. Congress will be urged at its present session to grant that sum. Who would oppose it? Even if destiny should so order that our neighbors and ourselves should become one and the same country, the improvements on both sides will be an urgent necessity for commercial purposes alone, within a very few years.

At the recent Deep Water Way Convention held in Detroit, it was stated by one of the speakers that when Canada has completed her improvements now under way, unless corresponding improvements are made on this side, "the United States could no more compete with Canada than a wheelbarrow could with a freight train." Our shipping interests on the Lakes, large as they now are, would be vastly increased if our lake vessels could only get to the ocean and engage in ocean business during the five months of the year in which navigation is practically closed in those high northern regions.

The improvement of the Lakes also implies an early deepening and widening of the Erie canal to a deep water ship way. That work would also be as much needed under a political union of the two countries as now.

GOOD HEALTH.

Health of the State.

The report of the State Board of Health for January, gives the mortality returns from 118 cities, towns and villages, having an aggregate population of 819,913. The deaths reported from all causes were 1622, at the rate of 23.64 per thousand per annum. Consumption caused 223 deaths; pneumonia, 285; la grippe, 96; bronchitis, 75; cancer is credited with 44—making that malady the fifth in point of fatalities on the list. Various complaints of the stomach and bowels caused 53 deaths; various throat diseases, 72, and diseases of the heart, 110. There were 595 deaths from various diseases of the lungs in January, as against 706 in December. There was also a falling off of 16 in diphtheria; 9 in typhoid fever; but an increase of 49 from la grippe.

The State at this time is free from small pox, outside of the Government quarantine station on Angel Island. There, however, the disease seems to have taken a permanent hold among the 500 Chinamen recently landed from a China steamer. The large number of cases which have been developing from time to time since the landing, tells in a most unmistakable manner of the terrible scourge with which the State would have been visited had not the Health Board and other proper authorities taken the most thorough precaution to confine the disease among those who are responsible for bringing it here. It is to be hoped the authorities will not relax their precautionary action until the malady is effectually stamped out on the island.

MEETING OF THE CITY BOARD OF HEALTH.

A very lively and interesting meeting of the city Board of Health was held on the 17th instant, at which the subject of small pox and general hospital matters were freely and somewhat forcibly discussed. The Board manifested a most firm determination to do its duty in all matters pertaining to the small pox invasion.

The general subject of the need of further and better hospital accommodation was freely discussed. The importance of more and special accommodations for incurables and cancer patients was referred to. Dr. Regensberger thought it would be wise and proper to call on the Legislature for an especial appropriation for such purpose, as San Francisco was simply a resort for such people from all parts of the State, and necessarily so from the fact that there was no other place for them to go to. It is to be hoped that this matter will not be dropped, but that it will be called up at the next meeting and more fully ventilated.

The Shag Rock business was freely ventilated, and found but one supporter, while all the other members of the Board present were free and generally very emphatic in their denunciations of the project.

The meeting closed with a very pretty and appropriate episode, which consisted in the reading of an interesting and well written paper by Mrs. Ellen A. Weaver, Matron of the Almshouse, and wife of Mr. P. L. Weaver, Superintendent of the same. Mrs. Weaver drew a very beautiful and vivid picture of life in that institution, and described in a striking manner the marked contrast between the characters of those who are obliged to seek that resort from unavoidable misfortune and those who find their way there as a consequence of their own misconduct and downfall. The paper was written for and read before the Century Club, of

which Mrs. W. has long been a prominent member, and by special request was repeated before the Board of Health. The address furnished the most striking evidence that the Matron, who is a well educated and polished lady, is the right person in the right place. She received a most hearty vote of thanks for her effort.

ELECTRICITY.

The Advance in Electric Railroad.

The progress which electric railroading appears to be making is simply amazing. Only three years ago, the number of such railroads in operation in the United States was only thirteen. It is claimed that the present number exceeds 400, with fully 100 more either in course of actual construction or in early contemplation! Only about 70 cable roads are in operation and in course of construction; while horse car roads are disappearing as fast as the work of reconstruction can be carried on. The electric railroad, both street and long distance, has come to stay, and is moving onward with all the exhaustless power of the ocean's swell. It has fully passed its experimental stage, and even with our present limited knowledge of its possibilities, it is better, cleaner and far cheaper than steam. Judging from the past and with our actual knowledge of the present, nothing is more certain than that the early future of electric railroading will show most wonderful progress. We append a few indications of the current progress in this direction:

A commission of railroad experts has recently been investigating, at Pittsburgh, the subject of electrical transportation as applied to railroads. The commission represented the Northern Pacific, Wisconsin Central, and other roads. The members visited the Edison works, the Thompson-Houston at Lynn, Mass., and then spent two days at the Westinghouse works. The partial result of their labor, and the intention of the railroads they represent, was reported by Chief Engineer McHenry, of the Northern Pacific Company, as follows: "I believe that the motive power will be applied directly to the axles of each car, thus making each car its own motor. Experiments are to be proceeded with at once; they will take place at the various works and much of the cost will be borne by the railroads. I don't see why electricity should not displace locomotives, and especially over steep grades. The question which will be most difficult of disposition will be the transmission of the current and the obtaining of adequate conductivity in the wires."

The expensive work now going on in Broadway, New York, of building a cable road through that thoroughfare, is alluded to as follows by a technical journal of that city:

"The meeting of the New York State Street Railway Association last week was almost wholly devoted to electricity, and that with the more significance that just outside of its hall were the new tracks of the Broadway cable road—one of the wildest pieces of folly that this generation of New Yorkers has seen. Splendidly built as the road is, one can but see in it the evidence of poor judgment and expensive short-sightedness. It is as though a man had invested heavily in fine stage coaches at the moment when steam locomotion had begun to make its triumphant demonstration. The paper by the incoming president, Mr. Beckley of Rochester, was enough to show which way the tide was running, for admitting all the defects of the electrical method, he was still compelled to advocate it as that which, par excellence, is the best for nearly every large community in the United States. The proof of the pudding is in the eating. Three years ago, there were a dozen operative electric roads in this country. To-day there are 375, with another hundred getting ready for work."

The subject of fast electric trains is becoming more and more a matter of general interest among railroad men throughout the country. A late issue of the *Chicago Journal of Commerce* states that:

"A company has just been incorporated in Springfield, Ill., for the purpose of building an electric road from St. Louis to Chicago. Among those interested are Gov. Fraoicis, Congressman S. W. Cobb, John W. Harrison, I. G. W. Steadman, Web M. Samuel, E. S. Rowe, William H. Thompson, Pres. of the Bank of Commerce, Dr. Wellington Adams, the inventor of the first successful electric motor, and John P. Kaiser. They represent several million dollars. The company proposes to build a double track road, as straight as an arrow, without a curve to it. On this road it is proposed to run electric cars, which will travel at the rate of 100

miles an hour, making the distance in 2½ hours instead of eight as now. The power station will be at Clinton, Ill., where the company will operate its own coal mine for fuel, using electric drills for mining machinery.

In time, the entire line is expected to become a boulevard, the farmers' houses standing on city lots, while behind them will stretch the wheat fields. The houses will be heated and lighted by electricity, and the reapers, mowers and thrashers will be driven by chained lightning. An electric block system will be operated, and the track will be automatically illuminated a mile ahead and a mile behind each car. Trains which are on the same section will have telephone connection, and communication may be had whether the trains are moving or standing still."

More Experiments in Electroculture.

It is reported in a French journal that further experiments in electroculture have been carried out near Garonne, by M. Barat. The growths experimented upon were potatoes, tomatoes and hemp. A row of hemp, subjected to the influence of the electric current, produced a row of stalks 18 inches higher than those not electrified, in the same time. Two pounds of potatoes planted in the path of the current, produced a fraction over 40 pounds of very large and healthy tubers, while the unelectrified patches only gave about 25 pounds of medium size. The electrified tomatoes also became ripe some eight days before the others.

A curious and important fact has been remarked by M. Barat in his experiments. If a quantity of manure is near the positive pole, the constituent parts of this manure are transported toward the negative pole, and their effects make themselves felt around a distance of some yards. This would seem to be a fresh proof of the opinion long advanced upon the part played by electricity in the growth of plants, an opinion also adopted by M. Specnew, who has given some attention to these phenomena; this is, that the action of the electric current upon plants seems to consist in the more active dissolution of the organic principles existing in the soil which are thus brought within the reach of the roots.

The leading article on the adjoining page of the present issue, entitled "The Philosophy of Electricity on Vegetable Growth," will be read with interest in connection with the above item and many others of similar import which have been published in these columns during the past few months.

A NEW DANGER.—Powerful dynamos are often placed near each other. The following item shows that it is not safe to pass between them when so placed. It is a new and unexpected danger, but one which may be easily guarded against. The item reads as follows: "While F. W. Martin, an electrician at Toronto, Canada, was passing between two large dynamos in action, he was suddenly rendered unconscious—shocked by induction. When he recovered consciousness it was found that he was blind. At last accounts, his final recovery was considered doubtful." In connection with the above, the following item from the *Saginaw News*, will be interesting as explaining why a line-man recently escaped with his life after making contact with a live arc light wire. The *News* says: "Fortunately the wire was a small one, and he had taken a firm hold of it; otherwise, as the dynamo at the works was running 2000 voltage power, he would have been instantly killed. A slight contact, it appears, is much more dangerous."

CUTTING ICE BY A HOT WIRE.—Electricity is to be brought to bear in reducing the labor of cutting ice—it is to do away with plows and saws. A wire will be stretched along the ice and kept redhot by a battery. Thus heated, it will sink into and cut the ice very rapidly, and much cheaper than by the present method. The idea is as yet only a suggestion, but appears to be perfectly practicable. In these days in which electricity is harnessed to all sorts of work, there appears to be no reason why it should not be employed as above.

ELECTRICAL BLASTING.—Electricity has been tried in Sweden for blasting. A deep hole is drilled in the rock and a Jablochhoff candle is inserted and the current turned on. The intense heat causes the rock to swell at all points, and internal strains crack the whole rock. Holes are best drilled into the solid parts, not, as in blasting, in the seams and soft places. Such a mode of blasting would avoid the dangerous use of powder and other more violent explosives when employed in near proximity to dwellings, as is often done in this city, with dangerous and sometimes fatal results.

Passing Events.

The memorial adopted by the State Miners' Convention has been presented to Congress and referred to the Committee on Commerce, which will give a hearing to the committees from this State very shortly.

Camminetti's joint resolution, directing the War Department to proceed with the work begun by the commission of engineers, has passed both houses and gone to the President for signature. This is a great step in advance and shows that something will be done this session to help the mining industry.

A miners' association was organized in this city on Tuesday, to represent the San Francisco county branch of the California Miners' Association. It is expected that a large membership will be obtained, since there are many persons in this city with investments in the mines of California.

THE two shafts of the St. John del Rey mine, Brazil, have been sunk on contract by hand-labor. The men were paid extra wages and were sent from England to sink these shafts, which they are doing at a very rapid rate. To quote from a recent report in an English paper, "Boring machines are not so good for sinking as for driving, and these men, in sinking, have knocked air-compressors into a cocked hat."

SHASTA COUNTY miners will organize a county miners' association on March 1st.

Where Gold Predominates.

A Colorado mining paper, in speaking of some recent important mining strikes, says: "One of the better features of these numerous strikes lies in the promised material increase of the output of gold. This metal seems to predominate at Cripple Creek, and also in the Boulder discoveries. In view of the low price of silver, which appears to be steadily declining, each new revelation of gold-bearing ground will be hailed with rejoicing."

In this respect, California has the advantage of the other mining States and Territories, its principal mines being gold-producing. It can scarcely be said, however, that this advantage is especially appreciated by the general public of the State outside of those directly interested, since capital to open and develop the gold mines has to be sought beyond our borders. The miners themselves have received very little encouragement from our own people of late years. One very important branch of the gold-mining industry has been prohibited from working for the last decade, and it was only hard experience which at last brought public attention to the great and direct loss entailed and the benefits which would accrue should these mines be rehabilitated.

Notwithstanding the fact that the \$10,000,000 per annum from these mines has been cut off, California still heads the list of gold-producing States of the Union, a position it has continually held for forty-two years. But there should be hundreds, if not thousands, of producing mines instead of the comparatively few we have, and there certainly would be if capitalists at home and abroad were suitably advised, or would visit our gold-mining regions and see for themselves.

In the other States, where silver predominates, they have been compelled to see their product become a political factor. They have to look up the quotation daily to see what it is worth, and must stand a greater or less discount,—but always a discount. Therefore they congratulate themselves and "hail with rejoicing each new revelation of gold-bearing ground."

Here in California gold may be found in a mountainous belt some 700 miles long, from San Diego to Siskiyou, with water, timber and a favorable climate to work in.

For the product of a gold mine there is always a prompt cash market. It never suffers by competition. There is no doubt about its ready sale. Trusts nor combinations do not affect it, and freight rates or distance have no disturbing influence. It is the basis of value; the standard for all other products; and the one thing for which everything else is produced and bartered. No legislation is needed for the metal; all countries receive it on an equality, and all men strive for it.

The mining for gold is a healthful, manly occupation, incapable of being overdone or excessively crowded. With a hundred times as many mines as we have, the products would not lessen in value nor would there be competition between the producers. There are quartz mines, hydraulic mines, drift mines, bar mines, river mines, beach mines, river bed mines, gulch mines—all producing gold, all being worked in different ways for the same product. Where rightly undertaken and prudently carried on, this work is attended with as little uncertainty as most other callings. There are of course blanks as well as prizes; but so there are in all industries. But the era of speculation having passed by, and that of legitimate business in this industry having been established, it is now conducted in this State on the same basis that exists in other enterprises.

THE Calico Mining Company has commenced three suits in the U. S. Circuit Court against the Waterloo Mining Co. of Calico, San Bernardino county,

Drift Mines and the Law.

There are in California many lava-capped "divides" or ridges covering the ancient river channels filled with auriferous gravel, which channels are mined by the drifting process, necessitating long and expensive tunnels before the gold-bearing channels can be reached.

This lava-cap is often a thousand or more feet over the auriferous deposits, and it is impossible to reach the gold without great expenditure of time and money.

The miners naturally do not desire to expend time and money on land to which they have no title; yet the Interior Department has decided that "the presumption that the gold-bearing channel extends under these hills, or that it contains gold in appreciable quantities will not answer and the miner must show the actual existence of gold," even before the end of the tunnel reaches the deposit.

That official rulings of this character continue to prevail, show as they do an entire ignorance of this branch of gold mining, absolutely prevent the obtaining of proper title to such mineral lands, and deter labor and capital from opening and developing or working this important field of gold mining.

The mining laws of the United States should be so changed as to recognize the peculiar features of drift mining, in order that patent can be obtained when work is commenced to open such auriferous deposits. The presumption being that the miner will not run tunnels to reach the buried gold unless his experience induces him to believe he will find it.

The miners all condemn the rulings and practice of the Department, which compels the miner to prove the existence of gold in paying quantities before he reaches the deposit containing the gold, and our legislators in Washington should call the attention of the Committee on Mines and Mining to the subject.

For the Miners' Cause.

Some of our cotemporaries are still criticizing the San Francisco Board of Supervisors because they gave \$1000 to the miners and then took it back. The fact is their intention was good, but the opinion of their attorney was that they could not legally give the money, so they had to rescind the original resolution. Nevertheless they gave their moral support, by passing a series of resolutions, which were officially forwarded to Congress.

Although the county, as a county, could give nothing, the citizens have subscribed several thousand dollars to the cause, and some thousands more are to come. San Francisco has done very well in this respect, as will be shown when the figures are published. The local county association, just formed, will soon give also a good account of itself.

The county which, next to San Francisco, has given the most is that of Nevada. The Supervisors gave \$1000, and the Nevada County Miners' Association \$1000 more. Several counties are yet to be heard from in this matter of collections.

THE MECHANICS' INSTITUTE.—At the annual election on Tuesday the candidates on the regular ticket were: A. S. Hallidie, D. A. Macdonald, A. W. Stott, George Cumming, Marsdon Manson, Charles A. Malm, Ferdinand Formhals. Those on the opposition were: Irwin C. Stump, Robert Ewing, W. T. Y. Schenck, J. K. Firth, Charles Elliott, R. P. Hammond Jr., Henry T. Bush. At a late hour Judges Culver, Royher and Gilmore announced the following result: Votes cast 1569, regular ticket 793, straight 612, scratched 181; opposition ticket 776, straight 503, scratched 273. When the ballots were all counted it was ascertained that all but two on the regular ticket had been elected. Of those on the

regular ticket Hallidie received 942 votes, Macdonald 842, Stott 799, Cumming 845, Manson 845. Of the opposition Stump received 772 and Firth 793. The two on the regular ticket who were defeated were Malm and Formhals.

The New Excitement.

The Creede camp is causing an old-time excitement in Colorado. Numbers of discoveries are being made, and hundreds of men are going in hoping to make the strike they have always been looking for. So far much of the work has been done in country rock from a surface barren of indications and covered with two feet of snow. Now and then some one makes a lucky hit in a blind way and this is sufficient to convince each one that his time will come. There is talk of sinking deep holes and of diamond drills to prospect the contacts and the suspected blanket formations, but so far 10-foot holes have been the limit of depth in these locations. The big producers are sending out the usual quantities of ore, averaging about 20 cars a day.

In the camp the boom goes on and gets bigger and apparently on more solid ground every day. Merchants are having enormous trade in all lines. Lodging houses and restaurants are no sooner opened up than they are crowded with patrons. Lumber companies cannot get lumber fast enough, and although nearly a dozen are in the field and getting immense quantities every day, they are unable to half supply the demand.

The railroad company finds it impossible to do the business. They are bringing in from 40 to 50 carloads of freight a day, but every sidetrack between Creede and Alamosa is full of cars loaded for Creede. The lack of sidetrack and other inability of the train and station crews to handle the immense quantity that the camp demands is felt in all lines of trade. The camp is out of coal, coal oil and some other staples, and the local merchants all have big bills held back in the freight blockade.

There is little telling, of course, how the camp is going to hold out, but the prospects are now that it will be permanent and rich.

Silver.

If silver keeps on the down grade in price some more of the big mines of Butte, Montana, will have to cease operations. The Clear Grit and Black Rock closed last week. The Granite Mountain of Montana and the Ontario of Utah are two of the great silver mines of the country which can keep on some time longer, but few others can.

The outlook for silver at this session of Congress does not appear to be very good and its friends are not so hopeful as before the session commenced.

The gradual drop in the price of silver is very discouraging to the miners in the silver camps. As there are more silver mining camps than gold this greatly affects the mining industry. In some of the big camps work is bound to give out for the men unless there is a change for the better shortly. Not only must those mines now opened curtail operations, but new ones will not be developed until the prospects are better than at present. Ores of gold, copper and lead will be more in demand for awhile until the silver question is settled. It is most unfortunate that it should have got into politics.

IN WASHINGTON.—The gentlemen who form the joint committee representing the interests of the valley men and miners of California have taken the entire lower floor of 510 Thirteenth street, not far from Pennsylvania avenue, Washington. These rooms were occupied by Congressman Camminetti, who very accommodatingly moved to the floor above. The place has been neatly decorated and well stocked with everything that is supposed to enter into true California hospitality, and in the reception rooms open house will be kept until the committee concludes its labors in Washington.

Mine Hoisting Cars.

Not long since we described the machinery used for handling and preparing coal at the Cross Creek Collieries, making extracts from a paper read before the American In-

stitute of Mining Engineers by Eckley B. Coxe, of Drifton, Pa. In that same paper he describes the "gunboats" used for hauling the coal from the bottom of the mine like an ordinary skip. The cars only circulate on the level gangways and are dumped into the gunboat at the bottom of the slope or other convenient point on it. The dumps employed at the bottom of the slope for dumping the mine cars into the

is prevented, however, by the curved arm (4), for the line joining the two pins in the curved arm passes to the left of the shaft connected with the lever, and therefore prevents the cradle from rising; but, if the lever (8) is thrown to the left, the cam (6), which

turn to a horizontal position, but are prevented by the hook in the lower end of the arm (4), which rests against the lever-shaft until the lever is thrown in the opposite direction, thus again bringing the line of thrust of the bar (4) to the right of the

stitute of Mining Engineers by Eckley B. Coxe, of Drifton, Pa. In that same paper he describes the "gunboats" used for hauling the coal from the bottom of the mine.

gunboat is shown in the accompanying plate. It consists essentially of two cast-iron sides which form the track and which are connected by two bars, which hold them

is on this shaft, moves the bar (5) to the left until the joint between bars (5) and (6) is thrown to the right of the line connecting the center of the shaft and the point of con-

central shaft, and allow the cradle to return to the position from which it started. The empty car is then taken away and another put in its place. By the rolling motion they are enabled to place the car in the cradle before the gunboat arrives, without having the car come in contact with the gunboat, so that the cars can be changed and the loaded car brought on to the cradle while the gunboat is being hoisted. In this way, hoisting can be done very rapidly, the car being always ready; and the only thing to be done by the man in charge of the dump, when the gunboat arrives, is to throw the lever over so as to break the toggle-joint. The coal slides very rapidly into the gunboat; he then reverses his lever, the car goes back to its first position and the gunboat can be immediately hoisted. This dump is very effective, allowing one car a minute to be very easily dumped into the gunboat and hoisted. There are two gunboats and two tracks; but the two tracks come together at the bottom, so that both gunboats run into the same dump. In the drawing, 2 is the cradle; 3, curved

slope to the top of the breaker. The slope known as No. 2 is very steep, over 60 degrees, and the breaker is situated at the mouth, so the two tracks run directly to the

at the proper distance apart. Upon the sides of each of these cast-iron bars there is a horizontal rack, and upon the timber frame there is a curved-toothed segment.

When this position is reached there is nothing to prevent the shaft from turning still farther to the right and the cradle

MINE CAR DUMP.

top of the breaker. It is found not to be economical to hoist the coal in the mine cars for several reasons. They, therefore, when the pitch is over 30 degrees, prefer to hoist with the "gunboat" shown in the cuts. This is the local name for an iron car much

When the car is placed on the iron frame, which is known as the cradle, so that the front wheels touch against the horn (13), which is curved upward, the center of gravity of the whole mass is such that the car and cradle tend to roll down and dump. This

from rising up, which allows the car to come into a dumping position; and the gate of the car being opened by a latch-lifter, the car empties itself into the gunboat. The cradle is so constructed that, when the car is emptied, the cradle and car tend to re-

rack; 4, locking arm; 5, connecting link; 6, cam; 7, pedestals; 8, hand-lever; 9, back cradle-shaft; 10, front cradle-shaft; 12, lever and cam-shaft; 13, horn. By reference to the cuts of the gunboat and the figures, its construction may be

seen. The parts are as follows: 9, front wheel; 10, back wheel; 11, front axle; 12, back axle; 14, rope socket; 15, link connecting rope socket and swivel; 16, swivel; 17, clamp over pulling beam; 18, head of swivel pin; 19, spreader bar; 20, front pulling bar; 21, pin for front pulling bar; 22, front side stiffeners; 23, back pulling bar; 24, pin for back pulling bar; 25, stirrup for pulling bar; 26, guard for pulling bars; 27, wings on mouth of gunboat; 28, pedestal for back axle; 29, pedestal cap for back axle; 30, brass-bearing for back axle; 31, long side of hinges for wings; 32, short side of hinges for wings; 34, angle part for side sheet; 35, stiffeners for mouth at wings; 36, rest for wings; 37, pin for wing hinges; 38, side sheet; 39, back brace for inside; 40, front brace for inside; 41, pedestal cap for front axle; 42, pedestal for front axle; 43, angle-iron stiffeners; 44, riveting plate on spreader bar (19), 45, top sheet; 46, bottom sheet; 47, back sheet; 48, pin in cone socket; 49, side and bottom binder; 50, nut on pin for front pulling bar; 51, bolts for front pedestal cap; 52, bolts for back pedestal cap.

Cause of Geological Climates.

Mr. Manson's Reply to Mr. Lindgren's Criticism.

SAN FRANCISCO, Feb. 14, 1892.

TO THE EDITOR.—In your issue of Feb. 6, 1892, occurs a communication from Mr. W. Lindgren of the U. S. Geological Survey, criticising a recent paper by the undersigned, which paper is entitled "The Cause of the Glacial Period and an Explanation of Geological Climates." [Proc. Technical Soc., Vol. 8, Sept., 1891.]

Mr. Lindgren admits that he does not attempt to discuss the theory of the author regarding the cause of the glacial period, but confines his criticisms to a denial of the facts cited by the author in support of that branch of his theory which relates to the glacial period, and an endeavor to show that the deductions are not sustained by geological investigations, but are actually shown to be erroneous.

The author regrets that Mr. Lindgren should have thus restricted his criticism: for the argument applies not merely to the glacial period, but to the whole range of geological climates; and the facts adduced by the author in support of this latter and more comprehensive branch of his theory—and not controverted by Mr. L.—are, in an eminent degree, corroborative of the former branch of the theory.

Mr. Lindgren admits that during the quaternary period ice covered certain parts of North America and Europe in thick sheets. These thick sheets, according to Geikie* and Wright† covered three-fourths of these continents. The evidences relied upon to establish this extension are really evidences and lines of glacial retreat, rather than of maximum glacial extension in a milder form. The thickness of these sheets was measured not only by hundreds of feet, but in places by thousands of feet; under these conditions it is not unwarranted, in the face of wider evidences of local glaciation as in Virginia and Colorado, to show that milder glaciation may have occurred to a considerable extent over the remaining continental areas of Europe and North America. Asia being in the same latitude, and glacial phenomena of enormous extent having been partially explored, must have been similarly glaciated in corresponding latitudes. The author does not wish it to be understood that every individual square mile of each continent was under ice, as much bare land is known to exist in Greenland now, although that continent is usually referred to as glaciated. But he does mean that the greater portion of each continent has been glaciated.

There were unquestionably areas of considerable extent which escaped glaciation, such as the great "unglaciated area" of the Yellowstone basin. This region was protected from glaciation by a local cause. This cause was the vast and continuous output of earth heat in the lava beds covering portions of Wyoming, Idaho, Oregon and Washington, the protected region being in the immediate path of the currents of air traversing the earth from west to east, and parallel with the lines of cyclonic movement, charted in each number of the Monthly Weather Review and noted in Proc. of Technical Society, Vol. 8, June, 1891.

This heat caused the precipitation upon

the unglaciated area to be warm rains instead of snow. To it the animals of the tertiary period retreated, as glacial conditions surrounded them. Here they were able to survive and develop, and hence the great abundance of their remains in this region.

The cause of this great lava outflow was due to the weakness of the crust at this point and to the disturbance of the previous equilibrium by the load of glacial ice on adjacent land areas and the load of sediment deposited upon the floor of the ocean by the Columbia river.

There is a combination of facts establishing the truth of this explanation which puts it beyond dispute, but it is not necessary to introduce them here.

So far as concerns the restriction of glaciation in California to the 4000 foot contour above present sea level, the author refers Mr. L. to Prof. Le Conte, who reports glacial gravel in the hills back of Berkeley, and to a critical examination of Livermore valley and the canyon of Alameda creek.

Should Mr. Lindgren be in doubt as to the glaciation of the valley of the Amazon over areas where a mean annual temperature of 76° Fahr. now prevails, the author would refer him to Geological Sketches Agassiz, pages 154 et. seq.

Also to *Geology and Physical Geography of Brazil*, Prof. Ch. Fred. Hart of Cornell, pp. 22, 28-9, 217, 469-70, 558.

Prof. Hart went to Brazil believing even Agassiz wrong, but, instead, corroborated Agassiz in the strongest manner.

With regard to the Glaciation of Southern Asia, in India, reference may be had to the following papers: *Jor. Geol. Soc. London*, Vol. XLVI, p. 66; *Mem. Geol. Survey India*, Vols. XXII and XIV; *Record Geol. Survey India*, Nov. 1880; *Jour. Asiatic Soc. Bengal*, Vol. XXXVI, p. 113.

For Australian Glaciation: See—*Climate and Time*, Croll, p. 295; *Am. Jour. Sci.*, Vol. 32, 3rd series, p. 244; *Proc. Linnean Soc.*, N. S. W., May, 1886.

For South African Glaciation: See—*Geol. of South Africa*, Stow; *Quart. Jour. Geol. Soc. London*, Vols. 17 and 18.

As regards the synchroglacial of these continents, the author accepts the observed facts and the natural and legitimate deductions from known laws, in the absence of any conclusive evidence or demonstration to the contrary.

Geologists have not proved by observed facts that any of the great eras of climate, from the Archæan to the Psychozoic era, were synchroglacial in their occurrence from Pole to Pole, nor even upon continents in the same latitude; nor, again, have they proved the contrary.

The demonstration in this discussion presented by the author, shows that such occurrence must have been synchroglacial, and the observed paleontological evidence substantiates this demonstration—the order of climates being everywhere the same.

The evidences upon which to base a glaciation occurring during the Permian and Carboniferous ages, so far as the author is aware, are of a very obscure and meager character; and occurring between strata containing fossils of an ultra torrid or torrid character, are extremely doubtful. Had these evidences occurred between strata containing fossils indicative of a gradual approach to temperate climates (as do Cenozoic glacial phenomena), the evidence would be more entitled to credence.

The proneness to ascribe glaciation to the recurrence of certain mild astronomical influences, pointed out by Adhmar, Croll and Ball, accounts for much imaginary glaciation in the minds of glacial enthusiasts.

MARSDEN MANSON.

ANTIMONY SMELTING.—Burke Bros., builders and contractors of Reno, have just completed a new furnace for the Boston Antimony Mining Co., whose mines and works are situated at Black Knob, east of Lovelock, in this county. The *Reno Journal* says the furnace is built in accordance with the designs of Dr. H. H. Hutchins, superintendent of the mines, who has had much experience in smelting antimony. It is expected to produce five tons per day of star antimony from the ores now being mined at Black Knob. James Burke, one of the firm of Burke Bros., says the furnace is in running order, but it is deemed advisable to let it dry a day or two before firing it up. He also states that the company has a number of mines near the smelting works which are producing high grade ore, and the indications are that a lively mining camp will spring up at Black Knob.

MANGANESE IN CAST IRON.—As manganese in cast iron increases beyond 50 per cent, the mass cracks in cooling, and when it approaches 98 per cent the mass crumbles or falls to pieces.

The California Miners' Association.

Officers, Committees and Constitution and By-Laws of the State Organization.

As the natural outgrowth of the State Mining Convention, and in accordance with the resolutions of that body, the California Miners' Association has been organized.

The officers of the Association are as follows:

HON. J. H. NEFF.....President.
W. C. RALSTON.....Secretary.
THOS. B. EVERETT.....Ass't Secretary.
H. PICHOL.....Treasurer.

THE CONSTITUTION.

ARTICLE I.

SECTION 1. This organization shall be known as the California Miners' Association.

Sec. 2. The objects of this Association shall be to protect, develop and foster the mining industry of the State of California in all its branches.

ARTICLE II.

SECTION 1. The officers of this organization shall be a President, Vice-President, Secretary, Assistant Secretary, Treasurer, and an Executive Committee, consisting of eleven members selected at large, and one additional from each county represented in the Association, to be selected by the President of this Association.

Sec. 2. All officers to serve for the period of one year, or until their successors are elected or appointed.

Sec. 3. The President and Secretary of the Association shall be ex officio President and Secretary of the Executive Committee.

Sec. 4. There shall be an annual meeting of this Association held in San Francisco on the second Monday in October in each year.

ARTICLE III.

SECTION 1. The Executive Committee of this Association shall have full power to transact all business of the Association, except such as may be transacted at any General Meeting of the Association.

Sec. 2. The President shall preside at all meetings of the Association, sign all drafts and checks authorized to be drawn on the Treasurer, and perform such other duties as are herein prescribed, as usually pertain to that office. In the absence of the President, a Vice-President shall perform the duties of that office, taking precedence in the order of their appointment, unless otherwise ordered by the Association.

Sec. 3. It shall be the duty of the Secretary to keep full and correct minutes of all meetings of this Association, and of the Executive Committee, and shall render annually to the Association a full report of all the transactions of his office; receive all moneys of the Association, paying the same to the Treasurer and taking his receipts therefor, and perform such other duties as may be required of him; either by the Association or the Executive Committee thereof. The Secretary shall give bonds in such sum as the Executive Committee may determine, for the faithful performance of his duties, such bond to be approved by the President.

Sec. 4. It shall be the duty of the Treasurer to receive all moneys of the Association, and safely keep the same, and pay the same only upon orders drawn by the President and countersigned by the Secretary. He shall render an annual report to the Association, and upon the request of the President of the Executive Committee, shall, at any time, furnish to said committee, a statement of the condition of the funds of the Association. The Treasurer shall give bonds in such sum as the Executive Committee may determine, for the faithful performance of his duties, such bond to be approved by the President.

ARTICLE IV.

SECTION 1. The headquarters of this Association shall be at the city and county of San Francisco.

Sec. 2. It shall be the duty of the Vice-Presidents of this Association to at once proceed to the formation of a County Organization in their respective counties. Such County Organizations shall be recognized as branches of this Association.

Sec. 3. All persons friendly to the mining interests are eligible to become members of this Association. In the event that there is no County Organization, such person may unite with the State Association by forwarding his name to the Secretary thereof, and paying a membership fee of one dollar (\$1.00), upon which he shall be furnished by the Secretary with a certificate of membership. But this shall not constitute him a delegate to the meetings of the Association. County Organizations may admit nonresidents as members.

Sec. 4. Each County Organization shall be entitled to one delegate to the State Conventions for each ten members, to be selected as such County Organization may determine.

This Constitution may be amended at any General Meeting of the Association upon a vote of the majority of delegates present.

Adopted by the Executive Committee, Jan. 22, 1892.

BY LAWS.

SECTION I.—The Executive Committee shall be authorized to appoint from among themselves such subcommittees as they may determine. They shall fill all vacancies of the officers of the Association or members of any committee. The Executive Committee shall have power to remove any officer of this Association who is derelict in his duty, upon a two-thirds vote of all the members present at such meeting, provided that no officer shall be removed until he shall have been notified of the intended action of the committee, and afforded an opportunity to be heard.

Sec. II.—The Executive Committee may, from time to time, levy such assessments upon county organizations as the necessities of this Association may require. Any county organization delinquent at the time of the annual meeting, on account of any assessments levied 90 days preceding such date, may be deprived of representation.

Sec. III.—All parliamentary questions shall be determined in accordance with Cushing's Manual, unless otherwise ordered by the Association.

Sec. IV.—Unless otherwise ordered, the President shall appoint all committees of this Association.

Sec. V.—The meetings of the Executive Committee shall be held at such times as they may determine. Special meetings of said committee may be called by the President whenever deemed advisable, and upon the written request of any five members of the Executive Committee the President shall call a meeting thereof.

Sec. VI.—At all meetings of the Executive Committee seven members shall constitute a quorum for the transaction of business. Whenever practicable, each member of the committee shall be notified personally or by mail of such intended meeting.

Sec. VII.—The Secretary and Treasurer shall receive such compensation for their services as the Executive Committee may, from time to time, determine.

These by-laws may be amended at any annual meeting of the Association, upon a vote of the majority of delegates present.

Adopted by the Executive Committee Jan. 22d, 1892.

The headquarters of the California Miners' Association have been established at room 23, No. 331 Pine St., S. F., Stock Exchange Building.

MINING AND SCIENTIFIC PRESS PREMIUM.

WHO WILL BE NEXT PRESIDENT? NEELY'S GREAT HISTORICAL CHART POLITICAL AND UNITED STATES MAP.

A Double Wall Map, 5 feet 6 inches by 3 feet 10 inches, mounted on rollers top and bottom, ready to hang.

Better than an Encyclopedia.

A Panorama of American History.

Printed in Eleven Beautiful Colors.

LARGEST, LATEST AND BEST, WORTH \$10.00, GIVEN FREE.

IT TELLS

How many Presidents we have had and Politics of each. What party George Washington represented. What Presidents died while in office. How many Presidents served two terms. Which candidate received the largest number of votes and was defeated. When each political party was organized. How many Congresses have convened and the Political Complexions of each. The number of States in the United States and the one having the most miles of railroads. How many Political Parties have existed in the United States.

A Complete History of our Government by Administrations, Political Parties, and Congresses from Washington to Harrison.

On one side the latest U. S. Map, showing all States, Counties, Railroads and Towns (price alone, \$5.00) and on the other side:

A diagram showing all the Political Parties, 11x66. A diagram showing all the Presidents and Cabinets, 5x66. A diagram showing Political Complexions of each Congress. A diagram showing Creeds of the World, 13x10. A diagram showing Standing Armies of each Nation, 13x10. A diagram showing Naval Tonnage of each Nation, 13x10. A Complete Map of the World, 13x20. A Map of Central

America, 10x13. A Map of Alaska, 10x13. A Map of South Africa, 10x13. A Map of Upper Nubia and Habesh or Abyssinia, 10x13. A Map of Persia, Afghanistan and Beloochistan, 10x13. A Complete Map of Solar System, best ever made, 10x13. The Names of all Cabinet Officers, with length of term. Pictures of all the Presidents, from Washington to Harrison.

ILLUSTRATION OF MAP PACKED READY FOR SHIPMENT

INDORSEMENTS.

BENSON J. LOSSING, LL. D., Historian: "Like a concave mirror, it reflects to a single focus an epitome of the essential elements of our national history, showing clearly at a glance the progress of the nation from its infancy to its present period of maturity."

PROF. G. F. WITTER, JR.: "It is concise, complete, and in the study of political history indispensable."

HON. J. C. BRANNER: "It can not fail to be of great utility to the people without regard to party or occupation."

SUPT. G. R. SHAWHAN: "I think it very fine indeed."

SUPT. A. F. CLARK: "Grandest success ever issued."

AGENTS' REPORTS.

"Received sample; sold 8 maps the first hour."

"Magnificent map; my boy sold 12 the first day."

"I sell 9 each day."

"Have 7 agents at work selling 60 a day."

"Called on 30 houses, sold 28 maps."

"Made 10 calls, sold 21 maps."

"I sell at every office, without exception."

"Received the 10 maps, sold 7 before supper."

"Sold 17 yesterday, will send order Saturday."

The **LARGEST AND LATEST U. S. MAP**, printed in colors, covers the entire back and is the best published. It alone sells for \$5.00. The complete Reversible Map (printed on both sides) is 3 feet 10 inches, by 5 feet 6 inches, mounted on rollers top and bottom, with tape on sides. These two maps sell separately for \$10.00.

This Magnificent Map will be sent (mounted on rollers, postage prepaid) to subscribers to the MINING AND SCIENTIFIC PRESS for \$1.00 in addition to the regular subscription price of the paper. The Map will not be sold to any person not a subscriber nor to any subscriber who does not stand credited upon our books with an advance payment. The premium is the best ever offered in California. SHEET IRON PIPE

ALL SIZES, FOR GAS, STEAM AND WATER.

— WE MANUFACTURE —

SHEET IRON AND STEEL PIPE,

ALL SIZES.

For Water Supply, Mining, Irrigating Purposes, Stock
Ranches, Etc.

Made in Lengths Desired from 16 to 30 feet.

The Out shows a Section of Three Joints

DOUBLE RIVETED SHEET IRON PIPE.

In the manufacture of this Pipe, we use only a high grade of annealed
Charcoal Iron of great tensile strength.
The weight or thickness of metal used, is graded according to service
required, and pressure to which the Pipe will be subjected.

FOR ALL UNDERGROUND PURPOSES, we immerse the Pipe
in a bath containing a special mixture of ASPHALTUM, BITUM and
PETROLEUM, at a Temperature of 300° Fahrenheit. It thus
receives a thorough coating, both inside and outside, rendering it impervious
to the alkalies of the earth, rust, etc., and is practically indestructible.

The Smyrna Fig Insect.

The Reason Why All Attempts to Introduce it into California Have Failed.

SAN FRANCISCO, Feb. 20, 1892.

TO THE EDITOR:—Since the experiments conducted by George Roeding in Fresno have shown that the fecundation of the pistillate flowers is sufficient to produce an article equal to the Smyrna fig, several attempts have been made to introduce the insect, which in Smyrna is used to perform this office. This insect, already mentioned by Theophrastus, and for more than 3000 years known by the name *Psen*, belongs to the genus *Blastophaga*, one of the gallwasp family.

This insect carries the pollen of the staminate flowers to the stigma of the pistillate ones, of course unintentionally, because its real object in entering the fig is a very different one.

Before pointing out the cause of failure in the introduction of this insect, it will be necessary to discuss some generalities in the biology of the gallwasps, so that the nature of the mistakes may be discovered and in further experiments avoided.

All gallwasps known, produce but one generation a year; this statement refers only to gallwasps, not to gellflies (*Cecidomyia*), which develop several, and Aphidid gell-builders (*Eriosoma*, *Pemphigus*), etc., which develop many generations.

The gallwasp begins its career as a maggot, in spring. This maggot comes from an egg laid by a wasp, hibernates and also impregnated for considerable time. The wasp is at all times ready to lay the egg, and the moment of laying it depends entirely on the development of those vegetable organs on which the gall, the future habitation of the maggot, has to be formed.

The gall, or the swelling which is formed by the sting of the wasp inserting the egg, is of different shapes and sizes, according to the species of the insect; and as the celebrated entomologist, Baron von Osten-Secken, has observed, in some North American species, differs even in regard to the two sexes.

How the infinitesimal quantity of liquid inserted by the sting of the mother wasp is able to produce such a variety of forms, distinct according to species, and always the same in the same species, is one of the mysteries connected with the biology of this interesting group of insects.

We abstain here from all speculation about cause and effect, and state only the facts of practical importance.

The life of the gallwasp, in its maggot stage, is not a long one. Those of the Northern Temperate zone are, without exception, found in their winged state at the end of August. The tropical species are little studied, and the Southern hemisphere, although abounding in gallbuilders of other classes, exhibits but the few Australian gallwasps described by Schrader.

It is another curious instance in the life of the gallwasps that although winged, and otherwise perfectly qualified for out-door life, it does not quit its habitation, but remains inside the gall without food, and the monothalamous species, viz., *Cynips quercus folii* L., even without mate.

Another element of mystery that enters the biology of these little beings is their propagation. We know the females of every species, but there is a considerable number whose males never have been found. The males of some species are wingless. Now the reverse, i. e., winged males having wingless females, is of frequent occurrence in the insect kingdom, but a wingless male belonging to a winged female is of rather rare occurrence, and may under these circumstances be explained by the necessity of planting the eggs for the next generation on the exact spot and under the conditions which are indispensable for their development. A great many tropical relations of the *Blastophaga* possess such imperfect males. It is possible also that males exist even more imperfect than the wingless ones, never developing beyond the maggot form, although sexually perfect. We notice analogous phenomena in the history of the life of parasitical wasps, viz., *Microgaster* and other relations of *Ichneumon* and *Ophion*, etc., amongst whom in many cases males have not been observed. But there still remains the mystery of the monothalamous females, like *Cynips Agamos*, because it is difficult to imagine how the single inhabitant of a gall can be impregnated, and I incline very much to the theory that these instances of mateless females rest on imperfect observations. In these instances of mateless females the males exist perhaps even in the winged form of their mates but are very short lived and disappear before

autumn, several months before we find the impregnated females crawling on the bark of oak trees and waiting for the budding of leaves into which to insert their offspring.

But this has little to do with our present object. We want to state—

I. That like the rest of the gallwasps the fig insects, *Blastophaga*, exist in their perfect state early in the fall;

II. That like the rest of the gallwasps it hibernates in the gall without food;

III. That this condition extends up to the time when the fig tree produces its buttons.

Now arises a complication. The *Blastophaga* partakes of the peculiarity of many organisms. It is capable of a limited degree of adaptation to abnormal circumstances under whose influences it develops an abnormal generation.

Caprification, practiced from time immemorial, rests on this peculiarity.

Let us now trace the history of the *Blastophaga* from the moment when the young brood in spring is planted by the impregnated female.

The female dies like a majority of insects does after this biological process, and old Theophrastus, who observed 3000 years ago the *Blastophaga*, states this phenomenon in his matter-of-fact style by saying: "They disappear from the fig, some leaving a wing, others a leg inside as a proof of their former presence."

The little insects die, but their offspring survives, and if left alone, develops about August, but remains in the wild fig in which it hibernates and shares its fate to repeat the cycle of its own biology by entering, in spring, a budding wild fig and implanting into it its progeny.

That is the regular course, but if interfered with by caprification, viz., by the wild fig containing its offspring, the *Blastophaga* in its maggot state being removed from the tree and hung up on the domesticated fig, then, an abnormal development will succeed the interruption of the vegetable process on which the existence of the insect depended.

We ought to have stated before that the gallwasp maggot depends as much on the gall which it inhabits as the gall itself depends on the plant on which it grows. If the gall is separated from the plant, the gall begins to shrink in most instances. Its inhabitant, the maggot of the gallwasp, then dies, and this circumstance is the most serious obstacle in studying the life history of these insects as any practical entomologist has experienced; but there are a few species which, under such circumstances when already developed to a certain degree, are able to hasten their transformations in the same way as caterpillars when suffering from want of food, although not yet fully prepared, will undergo their transformation and yield a moth somewhat depauperated and generally sexually immature.

The same phenomenon takes place in regard to *Blastophaga* when used for caprification; the withering fruit of the wild fig tree, inhabited by the *Blastophaga* maggot, accelerates its transformation, the wasp emerges from the wild fig, and, following its instinct, enters the domesticated variety, where, by its movements, it carries the pollen to the pistils and fecundates the seeds. It serves to propagate the plant, but is not able to propagate its own species. We will leave here all speculation as to the causes of such a series of interesting biological phenomena, and will draw only our conclusions in regard to practical horticulture.

I. The generation accelerated for the purpose of caprification perishes, i. e., it is useful for caprification but not for the reproduction of its own species.

II. If we do not want to go to the trouble of introducing the *Blastophaga* every year, we have to introduce the normal generation and colonize it on the wild fig, from which we may then draw our annual supply.

III. The normal generation can only be introduced during its hibernation, because that is the only time when the gall being ripe serves merely for protection, not for food.

As to the introduction of *Blastophaga*, we need not go to Smyrna. Lower California and New Mexico possess at least one species of *Blastophaga*. The keeping of the introduced insect during the first winter requires merely a cool place and some simple precaution to prevent escape, so that the insect may not get to wrong places, where it would perish without having left an offspring for the next year. H. H. BEHR.

CASTINGS UNDER PRESSURE.—The whole art of making castings under pressure needs to be learned. It is but in its infancy. There is required a casting machine which will do in iron and brass what the type-casting machine does in type metal.
